

REPORT

OF

THE TARIFF COMMISSION,

APPOINTED

UNDER ACT OF CONGRESS APPROVED MAY 15, 1882.

IN TWO VOLUMES.

VOLUME II.

WASHINGTON:
GOVERNMENT PRINTING OFFICE.
1882.

ISAAC A. HEDGES.

SAINT LOUIS, MO., *September 10, 1882.*

Mr. ISAAC A. HEDGES, of Saint Louis, addressed the Commission as follows:

The subject upon which I desire to speak is that of sorghum culture. This industry is a growing one, and I have devoted considerable time and attention to it. I have brought with me numerous samples of sorghum, produced in different parts of the country, to which I call the attention of the Commission. I have brought these samples with me from various sections to show you what is being done in Iowa, Kansas, Tennessee, Illinois, Missouri, Texas, and other States in this direction. You will see from the variety of specimens before you that this industry is spread over a large section of the country, although it is in its infancy comparatively. What we need at present is proper encouragement from the government in our efforts to permanently establish its production. We ask the Commission to recommend to Congress that they encourage and assist us in this enterprise and in our effort to maintain this business.

By Commissioner UNDERWOOD:

Question. What amount of protection do you desire?—Answer. Whatever protection is sufficient for our brethren of the South who are cultivating sugar cane is sufficient for us. We join hands; our interests are alike. We are both engaged in producing the same pure article of sugar; there is no glucose mixture or deceptive colors used in our production. They are pure and good. The present tariff is satisfactory, so far as I know. There is no difference between our interests and the sugar-planters; they are one and the same.

By Commissioner GARLAND:

Q. What is the acreage devoted to sorghum in this country at the present time?—A. I can only state this, that the seed we have sold amounted to more than we have ever sold before. All the seed we had on hand was disposed of.

Q. What has been the acreage of sorghum heretofore?—A. I cannot state, as we have not been able to gather statistics to any extent. We have been expecting that the government would assist us in that way, by gathering the statistics at Washington. I think the acreage, however, this year, is at least double what it has ever been before in the United States.

Q. What is the probable amount of the product of sirup for 1882?—A. It will go far up into the million gallons. There are five large establishments in Kansas all the while at work, and in Illinois there are three or four more; also some in Iowa, and in Mississippi (on the college farm) they will probably work up 50 or 100 acres this year. It is a new industry with them.

Q. What is the average yield of sirup per acre?—A. It ought to amount to about 100 gallons, though a crop such as we are growing right here at the fair grounds will yield about 150 gallons. I have known the orange cane, a larger, more vigorous, and productive cane, to yield 317 gallons.

Q. What is the average wholesale price of it?—A. That depends upon the color. Very few of the gentlemen are sending in a product that is uniform in color. The specimens I have here would probably bring, some of them, 50 cents a gallon, and others 40 cents a gallon.

Q. Is the color owing to the peculiarity of the cane, or to the process of manufacture?—A. It is owing to both. For instance, this specimen [exhibiting a bottle of the sirup] was produced from a crop of 800 acres, where it was necessary for them to start early in order to get through during the season, and they worked the green cane, which accounts for the color.

Q. Could you give us the cost per gallon of manufacturing that sirup from the cane to the finished article?—A. That would be difficult to do. Nearly all the persons engaged in this business are inexperienced—have not been long in the business and are working to a disadvantage. We cannot run machinery as our friends in the South do in the culture of sugar cane. But it is estimated, taking into account the cost of equipment, and all that is necessary to produce it, that the cost would be about 15 to 18 cents a gallon.

By Commissioner KENNER:

Q. Has this product ever been put on the market here in Saint Louis in any quantity?—A. I sold here last year ten car-loads of it at 47 cents a gallon.

Q. How many barrels to a car-load?—A. About 44 or 45 barrels; This year they are sending 40 barrels to a car load. I have sold one car-load to-day. I should like to show you how beautiful it appears when it has gone through the refinery.

Q. What did you receive per gallon for that car-load you sold to-day?—A. 40 cents a gallon.

Q. And it cost you 18 or 20 cents a gallon to manufacture it?—A. It would cost that where it was made; but then there is 10 cents a gallon freight to be added, and other expenses.

Q. But I wanted to develop the fact that it was a profitable business for a farmer to engage in?—A. Oh, yes, sir; this same sirup is sold at retail for 50 cents a gallon.

Q. Has your attention ever been called to the fact that in New Jersey a bonus is given to the cultivators of this product?—A. Yes, sir; I am familiar with that. If Kansas should offer such a bonus it would bankrupt the State in a single season.

Q. What is the bonus given by the State of New Jersey?—A. It is a cent a pound for all sugar manufactured, and \$1 a ton for the cane used.

Q. Are you aware that there is a farm of 1,200 acres in New Jersey, of which 900 acres are devoted to the culture of sorghum?—A. No, sir; I have not heard of that before.

A. A. MELLIER.

SAINT LOUIS, MO.; *September 19, 1882.*

Mr. A. A. MELLIER, druggist, of Saint Louis, addressed the Commission as follows:

MR. PRESIDENT AND GENTLEMEN OF THE TARIFF COMMISSION: Among the diversified interests which have occasion to ask consideration at your hands, not the least important is the one which we have the honor of representing, namely, the wholesale druggists and importers of this city. Next to New York, there is no question but that Saint Louis is the largest distributing point for articles of this class in the entire country; our gross sales of foreign and domestic drugs, chemicals and essential oils, and druggists' sundries aggregating annually well up in the millions.

In our views upon the tariff we count ourselves among the *conservative element*, disclaiming free trade on the one hand and excessive duties on the other. We fully recognize the importance of a judicious tariff for the purposes of revenue towards meeting the full obligations of our government, but are opposed to granting governmental *subsidies* for the protection of private individuals and corporations at the expense of the general public. It is no exaggeration on our part when we assert that the home manufacturers of many articles in our line have enjoyed and are now enjoying under the existing tariff the benefits of protection to such an extent as to produce a lack of competition far beyond what is right, just, or healthy for the general trade. They have not only been *protected*, but they have been granted monopolies and thereby possess absolute power in controlling and fixing the prices of their products. The most earnest advocate of what is called "protection" will concede the injustice of this and will confess that these evidences of misapplied *charity* form a serious and threatening objection to the whole system.

We would urge a thorough revision of the tariff on these special goods to which this objection applies, granting home industries all just and reasonable facilities for the successful protection of their work by fair and proper legislation, but scrupulously avoiding such as removes all competition and establishes them as monopolists.

We would ask that all crude materials which are not or cannot be produced in this country, and which enter into the composition of these articles, be admitted *duty free*, and thus place our home manufacturers in a position to compete with foreigners on an even footing. Let them combat the alleged *bugbear* of cheap labor by the acknowledged Yankee superiority in mechanical ingenuity. Let them show their competitors, as has been done before, that brains and determination can accomplish in one day with ten men what has occupied the time of one hundred men for many days. Americans should scorn protection as a means of support. They have always been believed capable of protecting themselves, and their name all over the world is a synonym for independence and resistless energy and perseverance in the attainment of their objects.

Quinine is a drug most familiar to the public on account of its very general use, and has engaged the attention of Congress in connection with the tariff question for many years. Some two years ago it was placed on the free list at urgent solicitation, and since that time the price has certainly averaged somewhat lower. We sincerely believe

that it would now be only just to the home manufacturers to restore it to an import duty of 10 per cent. ad valorem, and we would anticipate if not a lower at least a more uniform price as a consequence. We have therefore signified our approval of this change in a memorial signed by the members of the Western Drug Association. We would also recommend that the cinchona barks, from which quinine is made, be admitted without any exceptions free of duty, and trust that in the revision of the internal-revenue laws all spirits for use in the manufacture of this article will be absolved from tax.

Sulphate of cinchonidia is a twin product of cinchona bark, and is used in the proportion of over two ounces to one of quinine. It has the same therapeutic properties as quinine and costing only one-half as much. It may be appropriately called the quinine of the poor. While quinine has been admitted free, this article, classed as a medicinal salt, is now taxed 40 per cent. When first introduced, with all the advantage of being a new preparation, and in a measure a substitute for a higher priced article, its marketable value was only 60 and 65 cents per ounce, while now it commands \$1, and has been considerably higher at other times. We would therefore recommend a reduction from 40 to 20 per cent.

To be as concise as possible in our enumeration of what we conceive to be some of the defects of our tariff, we will first direct your attention to the very complicated subject of duties on chemical preparations, and accordingly suggest as a corrective, to place them all, with exception of sulphate of quinine, on a uniform scale of 20 per cent. ad valorem duty.

Another feature of the existing law to which we are opposed is the discriminating duties on articles imported indirectly from countries beyond the Cape of Good Hope. This is not only burdensome, but unjust, and is purely a step in promoting a special marine interest, which has only at the best a very ephemeral existence. This provision, we are happy to say, however, will, after the first of January, 1883, be no longer in force, but during its existence it certainly works great injury to both commerce and manufacturers. We also favor the discontinuance hereafter of what we term "compound duties," which means levying a specific and ad valorem duty upon the same article. We also recommend the abolition of the 2½ and 5 per cent. commissions added to the original cost of our foreign invoices, it being simply an additional duty levied without apparent cause or reason.

Another ridiculous interpretation of the law to which we are subjected is the imposition of a duty on glass bottles and vials when the article itself is admitted free.

We name below a list of articles on which we think the tax excessive, and which appear to have no other justification than that they have always been so taxed, presumably for the special benefit of a few. Of these we would call particular attention to what is termed on the tariff book "toilet articles," on which we would ask a reduction of 50 per cent. on the present tax. Also to the brush list, embracing hair, tooth, cloth, nail brushes, and a variety of such necessaries, on which the duties should not exceed 20 per cent. These are articles which are erroneously called luxuries, and yet they must be had by every family in the land. In addition to an increased revenue to the general government, of which we must not lose sight altogether, we believe this reduction will result in a greatly improved manufacture of these very essential articles, brought about by a stimulation to competition, where now there is comparatively none. We have every advantage in the way of material and should be willing to compete honorably for the trade. In conclusion,

we would state that we have purposely limited our list, knowing the great number of articles which will be brought before you for revision, and realizing that the great extent of work before your Commission will preclude any examination in detail of special classes.

We submit the foregoing with great respect for your thoughtful consideration.

A. A. MELLIER.
 RICHARDSON & Co.
 MEYER, BROS. & Co.
 COLLINS BROS.
 GEO. K. HOPKINS & Co.
 JACOB S. MERRELL.

This report is signed by five of the wholesale druggists of the city of Saint Louis, besides myself. If you desire, I will read the names of a portion of the articles to which we call your particular attention.

Articles.	Present duty.	Proposed duty.
Acid, tartaric	per lb. 15 cents. . .	5 cents.
Asafoetida	ad valorem.. 20 per cent..	Free.
Cassia	per lb. 10 cents . . .	5 cents.
Chlan turpentine	ad valorem.. 40 per cent..	Free.
Chinoidine	do 40 per cent..	20 per cent.
Cinchonidia sulphate	do 40 per cent..	20 per cent.
Cod-liver oil for medicinal purposes	do 40 per cent..	20 per cent.
Oil, lemon	per lb. 50 cents . . .	Free.
Oil, croton	do \$1	60 cents.
Toilet articles, viz: Essences, extracts, toilet waters, cosmetics, hair oils, pomades, hair dressings, hair restoratives, hair dyes, tooth washes, dentifrices, tooth pastes, aromatic sachons, or other perfumeries or cosmetics used or applied as perfumes or applications to the hair, mouth, or skin.	50 per cent. ad valorem.	25 per cent.
Tooth brushes, hair brushes, and others made of bristles or hair.....	40 per cent..	20 per cent.
Pomades. The article known by the French word "pomade," being the odor of flowers preserved in grease and used as a basis for manufacturing perfumes, is taxed.	50 per cent. ad valorem.	
Recommended to be		Free.
Cologne waters and other alcoholic perfumeries. ad valorem and \$3 per gall..	50 per cent..	25 per cent. and \$2.
Toilet soaps: Fancy, honey, perfumed, transparent, and all descriptions of toilet and shaving.	10 cents per lb. and 25 percent. ad valorem.	20 per cent.
Castile soap	1 cent per lb..	30 per cent..
Sponges	20 per cent..	Free.
Bay rum	per proof gall. \$1	50 cents.
Fincoilve oil (salad oil, whether in flasks, bottles, tins, or barrels) . . per gall..	\$1	25 cents.
Patent medicines, viz: All pills, powders, tinctures, troches or lozenges, sirups, cordials, bitters, anodynes, tonics, plasters, liniments, salves, pastes, drops, waters, or medicinal preparations or compositions recommended to the public as proprietary medicines.	50 per cent..	25 per cent.

In regard to the pomades referred to, I will state that all the American manufacturers of perfumes import this grease from France. The perfumes are extracted from the flowers there, and brought to this country in large cans in grease, and they have these fine essences extracted from them to make extracts. It is really an article in which the manufacturers themselves are probably more interested than the druggists, because we do not import them directly. We merely suggest that they ought to come in free of duty as a crude material.

We also propose a duty on cologne waters of 25 per cent. and \$2 a gallon, which is more than the internal-revenue tax on the alcohol itself, because it is presumed that much of the alcohol is exported from this country and brought back in the shape of these perfumes and extracts.

By Commissioner UNDERWOOD :

Question. From whom do you purchase your quinine?—Answer. I presume over 50 per cent. is the American product.

Q. Who are the manufacturers of it?—A. Powers & Weightman, of Philadelphia; McKesson & Robbins, of New York; Rosengarten & Sons, of Philadelphia; Keasbey & Mattison, and White. I think there are five manufacturers in the United States.

Q. Do you find any difference in their prices?—A. Oh, no; they have to conform to the market price, and that is regulated now according to the supply and demand. Foreign quinine, you might say, virtually regulates the market price.

Q. I am not after inferences; I am after facts. They are all the same price, are they not?—A. The American quinine commands 10 to 15 cents an ounce more than the foreign quinine.

Q. But the American quinine is all of the same price?—A. Yes, sir; Powers & Weightman's quinine runs about 5 cents above that of the other American manufacturers on account of its reputation.

Q. You are engaged in the drug business here, are you not?—A. Yes, sir.

Q. You have made your recommendations. Now, can you call to mind any article in the *materia medica* on which you have recommended an increase of duty, or one on the free list which you propose to have taxed, except quinine?—A. In the suggestions we have made we have not recommended the abolishing of any duty; we merely plead for a reduction.

Q. Except on the single article of quinine, and on that you propose an increase?—A. Yes; but many of us have recommended that under protest.

Q. I should think it ought to have been under protest. Is not quinine a medicine?—A. Yes, sir.

Q.—And in very general use?—A. Yes, sir.

Q. It is on the free list?—A. Yes, sir.

Q. And you propose to tax it 10 per cent., do you?—A. We did that, thinking it would probably be an equipoise to the foreign competition.

Q. You have recommended a reduction of about 50 per cent. of duties upon all the perfumes used in this country?—A. No, sir; only about 25 per cent.

Q. Well, put it at 25 per cent.; while you have recommended that a medicine now free and in general use shall be taxed. Is not quinine very generally used by all the people, rich and poor?—A. Yes, sir.

Q. Who are the principal purchasers of these perfumes?—A. It is not confined to any particular class.

Q. But some people buy more than others; what class of people usually buy them?—A. The extremely poor may not indulge in perfumery, but I believe even the colored race are very fond of it.

Q. I understand that; but I ask you a plain, simple question, which you can answer if you want to, or you can evade. Who are the principal consumers of the perfumery sold by the druggists of this country?—A. I should say that the wealthy and middle classes were.

Q. Precisely so. Now, can you give any reason why you propose to reduce the tariff upon these articles and put it upon quinine, which is now admitted free?—A. I would not like to have you draw any inference from the fact that I suggest the restoration of 10 per cent. on quinine. In the goodness of our hearts—

Q. In the goodness of your hearts you respond to the request of five or

six manufacturers, and in obedience to their desire you ask that the tax of 10 per cent. on quinine shall be restored?—A. Yes, sir.

Q. Now, one other question and I am through. You say that the taking off of the duty on quinine has reduced the price?—A. Yes, sir.

Q. Do you not believe that the restoring of the duty would increase the price?—A. I do not think an addition of 10 per cent. duty would have any effect upon the price whatever.

Q. Then why do the manufacturers so earnestly desire it as to ask all the druggists of the country to come to their relief and have the duty restored if it would not increase the price?—A. I think foreign quinine would—

Q. I am not talking about foreign quinine, I am talking about American quinine, and that is a plain question.—A. I will leave that question to be answered by the manufacturers themselves. I have no desire to press that point at all, but as to the other articles I have referred to, I think the duties upon them are very excessive.

Q. I may not disagree with you entirely on that point, but I am trying to ascertain the reason why you have made a discrimination against quinine, which is a medicine of universal use; why you should recommend a tax upon that and let these other things go free?—A. Well, we have counterbalanced that by recommending a reduction of 20 per cent. on sulphate of cinchonidia, and the manufacturers will not thank us for making that suggestion. The same manufacturers make both these articles.

Q. How many firms in the United States are engaged in the manufacture of quinine?—A. Only five.

Q. And you would increase the price of quinine used by 50,000,000 people for the benefit of those five manufacturers. Won't you reconsider your recommendation and take it back?—A. I have already stated that I did that in obedience to the wishes of the Western Wholesale Drug Association. I do not come before you as an individual asking for it.

Commissioner UNDERWOOD. That is exactly what I believed before I began to question you.

By Commissioner OLIVER:

Q. You have referred to the matter of charges and commissions; what are the commissions generally paid on imports in the drug line—I mean the commissions on foreign invoices?—A. Two and a half per cent. on some and 5 per cent. on others.

Q. Have you any idea what percentage of charges there is in addition to that?—A. There are the consular charges.

Q. I mean the charges for packing and freight.—A. I do not know; I will refer you to Mr. Meyer, one of my colleagues, who can probably answer that question more accurately than I could.

Q. Can you suggest a rate which would be equivalent to what your charges and commissions now cost you, and which would cover them?

Mr. MEYER. I should say it would simplify matters if it was made 3 per cent., or not more than 5 per cent.

Commissioner OLIVER. I want figures which will cover your present charges and commissions.

Mr. MEYER. I should think about 5 per cent. would cover them.

Commissioner OLIVER. And you think that would be preferable to the present system?

Mr. MEYER. Yes, sir.

Mr. C. F. G. MEYER, druggist, of Saint Louis, said :

I will only consume your time for a few moments. We are willing to admit that we are asking the reimposition of the duty on quinine in the interest of the manufacturers; but we believe that it is not an unjust thing that we are asking. Even supposing that this 10 per cent. tax would increase the price of the article to that extent, we do not think the consumer would suffer by it, and for these reasons: Nearly all the quinine that the consumer buys from the retail druggist is bought by the drachm or scruple, or by the two drachms, or by the grain. I have been in the retail drug business a great many years myself, and I know there is no difference made in the price to the consumer in putting up prescriptions whether we pay \$2.25 or \$2.75 an ounce for quinine. The price is hardly ever changed in that way unless there comes to be a very great increase in the wholesale price. If the wholesale price was 100 per cent. more or 100 per cent. less, there would be a change in the price to the consumer. So that we can say positively, and I think all the retail druggists who are before you will confirm this, that the consumer, whom I suppose we ought to consider first in the matter, will not suffer by any such action at all. It simply results in this, that the retail druggist pays 10 or 15 cents an ounce more for it and the addition goes to the profit of the manufacturers. But we believe that the manufacturers need that protection in regard to this particular article, because of the greater expense in manufacturing it in this country. Furthermore, we think it would act as a kind of a governor to regulate matters. We are now subject to fluctuations which we think would be stopped, and the trade would have a little more confidence in prices, and the article would be more stable in its character, if a small duty was imposed upon foreign quinine.

By Commissioner UNDERWOOD:

Q. Do you understand that Messrs. Powers & Weightman are in embarrassed circumstances?—A. Oh, no, sir; I do not think that they would suffer if they went out of the quinine business altogether.

Q. Are Rosengarten & Sons in embarrassed circumstances?—A. No, sir; not at all.

Q. Do you know of anybody else engaged in the manufacture of quinine that you think liable to fail?—A. No, sir.

Q. You admit that a tax would have the effect of putting money into the pockets of the manufacturers?—A. Yes, sir.

Q. Is there any necessity for putting any more money into their pockets than they have already got? Is the government of the United States under any obligations to put money into their pockets when such action is of no benefit to the people?—A. No, sir, not at all; but I think we should foster, to a certain extent, our home industries, and I believe that if quinine can be imported free, we shall in time have to look entirely abroad for our supply, which, under certain circumstances, I think, would be unwise.

Q. You say there would be no difference in the retail price. Would there be no difference in the price by the drachm?—A. No, sir; you will find there is no difference in the retail price whether quinine costs \$2 or \$2.50 an ounce.

Q. There may not be any difference in Saint Louis, but from what I can ascertain there is a difference made elsewhere in the price by the grain, scruple, or drachm.—A. I have been in business elsewhere and I have talked with many druggists, and they all agree to what I have stated. I am speaking from my own experience, which has been very extensive.

By Commissioner OLIVER :

Q. Do you know who are the principal manufacturers and shippers of quinine abroad?—A. The largest manufacturer of quinine is Alexander Boehringer, of Milan, Italy, whose product is probably more extensively used than any other. There are also manufacturers at Mannheim, Germany; at Brunswick and Stuttgart, at Paris, and the Howards, in London.

Q. It has been stated to the Commission that there is a syndicate abroad controlled by Mr. Boehringer that really monopolizes the manufacture of quinine; is that so?—A. I have heard that stated, but have no positive knowledge of the fact. Mr. Boehringer, of Milan, has operated largely in the bark syndicate, so called, but it is not exactly known what the character of that syndicate is, to me at least.

Q. Is it the object of the wholesale dealers and jobbers in drugs, in recommending the reimposition of a 10 per cent. duty on quinine, to encourage the manufacture of it in this country, so that we will not be left to depend wholly on the foreign manufacturers for our supply?—A. That is it, partly, and also because we think it will act as a governor on the prices. I think the prices would be more stable and uniform with a small duty. As it is now they are fluctuating.

By Commissioner PORTER.

Q. In either instance we should have the choice of the two monopolies—the one abroad or the one here?—A. I do not think a moderate duty of 10 per cent. would create a monopoly, such as there formerly was when the duty was 20 per cent. or other high rates. I think it would not much more than equalize the matter. If an ounce of quinine, for instance, costs \$2, the addition of 10 per cent. duty would simply make it cost that much more to the wholesaler, and it will be a protection against the foreign manufacturer, which I think is required on account of the higher price of labor and material used in this country.

WILLIAM S. HASTIE.

CHARLESTON, S. C., *September 26, 1882.*

MR. WILLIAM S. HASTIE, of Charleston, S. C., made the following statement:

I have been in business in this State for fifty-two years, and my impression is that the people here do not wish any change in the present tariff. We are now building cotton factories, and we hope in time to make it to the interest of the manufacturers of Massachusetts, Connecticut, and Rhode Island to move to our State. The interior of our State is well adapted, by reason of its superior water-power and climate, to the manufacture of cotton goods, and to the support of a manufacturing population. Lands are cheap, and we can make all our laborers comfortable by enabling them to build houses cheaply and raise their own produce. This is the first time in the history of South Carolina when the people have really felt an interest in the tariff. A large number of factories are now being built in this State, and a very large amount of capital is invested in them, and if we begin now to change the duties on cotton and other goods, or on rice or other products, then other industries will want the duty changed on their products, and there will be no end to the matter. Since the war our interests have been identical with those of Massachusetts. It was different before the war, when we were wholly an agricultural country. All that has changed. I remember when Greenville in the upper part of our State was regarded as being in a wholly agricultural community. I have sold wheat flour that was raised in Greenville. It was carried 130 miles in wagons to Hamburg on the Savannah River, then transported to Savannah on the boat and sold at a profit. Now they are raising cotton at the foot of the mountains by the aid of these phosphates, where they were formerly in the habit of raising wheat; they can grow better cotton there than they can in the neighborhood of Charleston. In that way the whole industry of the country is changing, and our wants are not the same as they were. It has become a sort of stereotyped idea in South Carolina to oppose all tariffs, but now we are in a condition to take advantage of the change, and we think under the present tariff we can succeed as well as we could wish. As has been said, however, we want our protective tariff to be a permanent one. Our sugars require protection, so does our rice, and we are beginning now to require protection upon our cotton manufactures. Therefore I think that we do not desire any change in the present tariff.

W. H. JACKSON, ET AL.

NASHVILLE, TENN., *September 20, 1882.*

General W. H. JACKSON, of Nashville, Tenn., representing the farming interest, addressed the Commission as follows:

MR. PRESIDENT AND GENTLEMEN OF TARIFF COMMISSION: The limited time (twenty-four hours) since notice was served on me, requesting me to appear before you to offer a statement in regard to the present tariff system of the government, in so far as it affects injuriously the agricultural interests of this State, must be my excuse and apology for treating this important subject in a crude, farmer-like way.

It is conceded, on all hands, that agriculture is the source of all wealth, and the nursing mother of manufactures and commerce. While this is the case, it is made to bear unjustly, as we think, the heaviest burdens of government, through this indirect system of taxation. The agriculturists, from our situation, resources, and ability, do not need and can have no substantial protection, for the reason that no foreign country can bring agricultural products here in competition with us; but under the operation of the present tariff system, which gives to our home manufacturers practically the monopoly of the home market, the agricultural population are made to bear thereby by far the largest portion of this tariff on customs duty, for the great bulk of the articles consumed by agricultural people are increased in price to them just in proportion to the duties on the articles. This is too plain and self-evident to you, gentlemen, to need amplification. The present tariff system appears to me to undertake to protect every description of home industry without reference to its being of national importance. The old idea of Mr. Clay and the earlier statesmen, if I remember aright, was that the discrimination made by the tariff revenue system should be confined to industries of national importance—such industries as would be needed in case of foreign war, etc. Protection was originally afforded as a mere incident to revenue, but we have proceeded step by step until protection has become the main object, and revenue the incident. Such a system is steadily growing more and more oppressive and burdensome to the farming classes. It should, in my opinion, and I may add in the opinion of the great agricultural community, be so revised as to equalize the burdens and benefits of taxation to all classes and industries.

Agriculture should receive that protection from the government which she is entitled to by reason of the numbers, aggregate wealth, and taxes of all kinds paid by the farmers. That business which sustains the government the government should hold up. The goose that lays the golden egg should be cared for. Under the present system the farmer pays a duty of from 33½ to 60 per cent. on all articles consumed and on all articles or farm implements used by him. This, we think, is entirely too much.

The foreign market, on all our surplus agricultural products, regulates not only the price of what we export, but fixes the price of what we sell at home; for example, the price of cotton in Liverpool regulates the price of cotton in every village in the South, and while this is the case as regards what the farmer has to sell, what he has to buy is not at all controlled by the foreign market, but by the monopoly given to the

home manufacturer under the operations of the tariff system, thus making the farmer pay the enhanced price by reason of such protection, and I conceived that just in proportion as your duties operate to exclude the foreigner from our markets you limit to that extent the purchasing power of the man or people who are to buy our surplus agricultural products, while at the same time we are made to pay the enhanced price to our protected home articles. So it works an injury to the farmer both ways—at home and abroad—both in selling and buying. I am not insensible to the importance and value to the farmers in building up manufactories in our midst, as furnishing in some degree a home market for agricultural products, and as reducing the disproportion now existing in our State between agricultural producers and consumers, the producers being now 70 per cent. of our population. Markets are as necessary as products, and since grain bins multiply faster than grain cars, and therefore we cannot ship our produce by rail at a price that will pay us, home markets are very beneficial to the farmers, provided, under the protection system, we (the farmers) are not called upon to pay too much for the luxury.

Another point of apprehension shared by a great many thinking agriculturists is that if the protective system is carried too far, as seems the disposition of the manufacturing classes—as judged from their utterances in their conventions at New York and Chicago—it may lead to retaliatory measures on the part of foreign governments where our surplus agricultural products find a market. We are now sending vast amounts of grain, flour, beef, pork, butter, cheese, and cotton to Europe. These exports have turned the balance of trade in our favor, and has given to our government ample revenues—it has enabled us to buy and import much from the countries to which we sell. By statistics, land and nature furnished of the exports in 1879 (which were about \$710,000,000) \$609,617,299, while protected manufactures furnished \$89,921,443, a poor showing for manufacturing as compared to land in giving our country the balance of trade. Now our duties are felt to be severe upon those abroad who buy our products, and while they have submitted (with some murmuring) because of our large debt created on account of the war, yet they are now clamorous for a fair degree of reciprocity, and we fear, in the effort to protect the workers of the raw material, the farmers may have heavy imports laid on their productions in foreign countries, which would injure us very much, for if confined to home markets, our production would lower prices below a remunerative point, and the large surplus would have to be used for fuel—actually burned.

Already Bismarck, for Germany, is trying to impose duties upon our produce, and France, under the pretext that our pork is unhealthy, has shut it out once from its borders. An effort is being made in England to tax the cotton of the South, with a view of helping the British East India colonies, and also have increased the duties on tobacco from about 72 cents per pound to 82 cents. Our country is now seriously menaced by plans of this character.

These are my general views on this important question of public policy, and I may add, the views of the great body of leading agriculturists throughout the West, Northwest, and South, so far as I have been able to glean them from mingling with them, and participating in their conventions and associations, from 1865 to the present time. I cannot undertake to go into details and specify each and every article consumed by the farmer on which the customs duty, as at present laid, is too high.

They will readily suggest themselves to the Commission in the revision of dutiable articles.

It is proper that I should say that there is a growing tendency on the part of not only our people, but parties from other States, to invest in manufactories in Tennessee, to work up iron, cotton, and wool, and the farmers are so much interested in their establishment, as creating an increased home market for their surplus products, that I do not believe the farmers in this section desire any change in the tariff on these articles, viz, iron, cotton, and wool.

We think that revenue should be raised in large part from luxuries. The necessaries of life should be taxed light. And we further think that when from \$200,000,000 to \$260,000,000 of revenue is annually raised from customs duties, this surely ought to afford incidental protection enough to all our manufacturing interests, many of which are successfully competing abroad with English and other foreign industries.

By Commissioner OLIVER :

Question. What has been the condition of the farming element in this State for the last few years?—Answer. I think the condition of the farmer has been gradually growing better for the past few years. Last year there was a great drouth in Tennessee and an almost entire failure of the crops. This year we have very fine crops and an increase of about 50 per cent. in the product, especially in the wheat crop. So that I think I may say that their condition is not only improving, but their methods of culture are becoming more advanced. There is a greater disposition to use improved implements in farming than there ever has been, and I think the farming community are taking a more correct view of the subject of rotation in crops, deep plowing, &c., and are paying more attention to renovating their soils, so far as my observation extends, by the free use of clover, which I recognize as a very important advance step.

Q. How do the prices of grain and cattle at present compare with the prices received, say, twenty-five years ago?—A. I do not think the prices are any better on grain, but I think they are on cattle. That is to say, we can by reason of the improvement in the grasses raise cattle more cheaply in this section than we were able to do twenty-five years ago. There can be no better section of country, I think, for raising cattle or stock than the six counties known as the Cumberland Basin of Tennessee.

Q. My object was to ascertain your opinion as to the general prosperity of the farming classes twenty-five years ago when we had what might be called free-trade, and now under what is called high protection; as to whether they are in better condition or making more money now than they were then.—A. So far as that is concerned I am inclined to think they had more money twenty-five years ago than they have now, but I am not prepared to say whether that was the effect of free trade or the result of the labor system. But, whatever it was, certainly they had more money twenty-five years ago than they have now, judging from outward appearances at least. But I am not able to answer that question accurately, and only judge from the reports that have reached me. I was not engaged in agriculture in Tennessee at that time. I was in the Regular Army of the United States and on the frontier, so that I cannot claim to speak of that period.

Q. Suppose the changes you recommend were made, and the tariff materially reduced, how would you propose to raise the money neces-

sary to carry on the government?—A. I do not think you should take off tariff duties altogether; and that is not my suggestion. I believe in a revision of the tariff and the formation of a judicious tariff for the purpose of raising such revenue as is absolutely necessary. That, however, is only my individual opinion.

Q. Do you think the farmers would oppose any material change in the tariff that would reduce the revenues of the government, and make it necessary to impose direct taxation?—A. I do not think they would like direct taxation.

Q. They would rather have it where they do not feel it so directly, you think?—A. Yes, sir; that would enable them to bear it more patiently as they are bearing it now, because it is indirect.

By Commissioner BOTELER:

Q. I infer from what you have said that you appreciate the vital importance to agriculturists of diverting the industries of the country so as to keep as many people in other industries as possible, who will be the customers of the farmer and the consumers of his products?—A. Yes, sir.

Q. In that view, do you not think it important to encourage manufacturing and other industries?—A. Yes, sir; I think it is important to do so.

Q. In raising a revenue by taxation, do you not think it is better in the long run to discriminate, wherever it is possible, in favor of American industries as against foreign industries?—A. As a general proposition, I do. I think encouragement should be given to our home industries and manufactures. As I have said, what we especially want is, by the building up of these manufactures, to reduce the proportion relatively between the agricultural producers and the consumers. In our own State we can never attain the greatest prosperity until we can, by building up these manufactures, bring in more consumers and reduce the proportion between the agricultural producers and the consumers from 70, as now, to at least 60, and I think a greater prosperity would be produced by making it 50.

Q. You have no desire that our farmers (who constitute the most important and largest part of the community) shall be dependent on foreign countries for the sale of their products?—A. I would hope not; but I do not and can not look forward to the day when our home markets will be sufficient to consume our surplus farm products. We are producing so much with improved agricultural implements in the north-western part of our country, that I think we are obliged to have foreign markets, and it should be our policy to open up all our water routes so as to get those products transported as cheaply as possible.

Q. You have no idea that England will take our products unless she needs or requires them?—A. No, sir; it is her necessity which compels her to become a purchaser. But I think she will be very slow to adopt any retaliatory measures, because she might produce commotion among her own people by so doing. We shall be able not only to supply our home markets at a cheap rate, but to compete with Russia, which is one of the greatest wheat-producing countries in the world, in the foreign trade.

By Commissioner GARLAND:

Q. You have made a statement that tariffs laid by other countries were laid by way of retaliation. Please explain how you come to that conclusion.—A. Simply from the fact that I have observed that such

tariffs were being laid and I have gathered the impression from my reading that that is the object of them. They permit everything to go into their countries free, while we allow but few articles to come in here free; and I have gotten the general idea that it is more in the nature of a retaliatory measure than anything else. I may be right or wrong in that impression. If wrong, I would be glad to be corrected.

Prof. J. B. KILLIBREW, of Nashville, said:

I can state generally, as a matter of information to the Commission, that there are in operation in the State of Tennessee at the present time, seven coke furnaces and five charcoal furnaces; the seven coke furnaces making about 12,000 tons a month; and the five charcoal furnaces making about 3,000 tons a month. I believe I have had a very favorable opportunity of ascertaining the wishes of iron masters in regard to the tariff, and so far as I can ascertain I do not think they want any change whatever in the tariff. The reason assigned is usually this: that if the tariff rates are made higher, an immense amount of capital would be put into the business in Pennsylvania and elsewhere, and it would tend to make them formidable competitors of our interests here. All the old furnaces there would be revived, and it might act very injuriously to our industry here. Our State is in its second growth in that respect. In 1855, or 1856, there were thirty-five or forty charcoal blast furnaces in operation in the State, and it is a curious commentary on the improvements in the methods of manufacture, that we are making more iron with our smaller number of furnaces than we were then with this large number. I think the first furnace started in this State was in 1797. That made a very small quantity indeed compared with what we make now. The disposition of people here who have surplus capital is to invest in iron-making, and within the next two years I think we shall have in the State of Tennessee (or supplied with ores from the State of Tennessee), double the number of furnaces we have now in operation. I believe our people are perfectly satisfied with the present tariff duty on iron, and neither want it increased or decreased.

There is, however, a desire among the people here, so far as my enquiries have gone, that the \$28 a ton duty on Bessemer steel rails, should be reduced somewhat, for this reason: railroad building is now going on probably more extensively in the Southern States than at any time heretofore. The South has made very little Bessemer steel except at Chattanooga, and one or two other places, and the demand for steel rails is very great, and we think the rate of duty on Bessemer-steel rails has a tendency to retard the railroad development of the South.

In regard to the cost of making iron, I would rather that Mr. Shook, of Nashville, who is present, should address you, because he has all the statistics at his fingers' ends, having been a director in these furnaces for several years, and he can give you definite information.

I had the pleasure of being at Atlanta for five months during the exposition, and I found a great disposition among the people of the South wherever their resources permitted, to enter into the manufacture of iron. I think the determination of most of the capitalists in the State is, to invest a part of their capital, at least, in the iron manufacture. We look upon it as one of our growing interests.

In relation to cotton and woolen goods, there are gentlemen present who can speak on that question with more authority than I can.

By Commissioner GARLAND:

Question. You suggest a reduction of duty on steel rails. What

rate of duty would you recommend?—Answer. So far as I have heard any expression of feeling I should say that \$15 a ton would be considered a proper figure. I do not wish to do anything to injure the industry, but I think we should try and protect ourselves in this matter of railroad building. We want to live and let live; but \$28 a ton on rails is a very heavy tax on the building of our railroads, and we want to build a great many. Poor's Manual shows that we have made very rapid progress in the South in the building of roads during the past twelve months.

Mr. A. M. SPOOK, of Nashville, said:

I have been referred to as being able to answer the question about the cost of manufacturing pig-iron. I should be happy to answer any questions upon that subject that the Commission may put to me.

By Commissioner UNDERWOOD:

Question. What is the cost of manufacturing a ton of pig-iron here and elsewhere in the State of Tennessee?—Answer. It is about \$15 a ton here.

Q. How much of that cost is for labor, and what is the value of the raw material before the labor is performed?—A. It all represents labor. Do you want me to give you the cost of manufacturing the material at the furnace? Taking the ores in the mine and the coal and limestone in the ground and bringing them together and converting them into a ton of pig-iron costs \$15.

Q. That is exclusive of the value of the ore in the ground and the value of the timber or ore on the ground?—A. Yes, sir. That is the cost of the labor in making a ton of pig-iron.

Q. What does the material cost?—A. I do not know that I can answer that question except in this way, that the royalty paid in this country varies from ten to twenty-five cents a ton on coal and ore. Nothing has ever been paid on the limestone. I do not know anything about the charcoal.

Q. What is the difference in the cost of labor here and in England, Scotland, or Wales in the making of a ton of pig-iron?—A. The cost of labor required to make a ton of pig-iron here is about two and a half times the cost in England. I make that statement upon information I have derived from a former manager we had who has gone to England, and is now running three furnaces there. He wrote me only a short time ago that the labor of manipulating it from the raw materials cost 75 cents a ton, while the lowest we can do it for here is \$2 a ton. So that I think the cost here is at least two and a half times as great.

Q. Do you know what the cost of labor is in England in the production of a ton of pig-iron?—A. I think it costs about \$6.

Q. And you say it costs \$15 in this country?—A. Yes, sir.

Q. That would make a difference of about \$9 a ton?—A. Yes, sir.

Q. What do you think should be allowed for the geographical protection which we have here, which means simply the cost of getting a ton of pig-iron from England to this country?—A. I do not know what the ocean freights are now, and it would depend also where the iron was delivered. If you delivered iron on the eastern coast it would cost much less than if you delivered it at St. Louis. I think it would cost from \$7 to \$7.50 a ton to deliver Liverpool pig-iron at St. Louis if it went by rail.

Q. What would it be, delivered in New York?—A. I could not say; I do not know what the ocean freights are.

Q. You are satisfied with \$7 a ton on pig-iron?—A. Yes, sir; I am.

Q. If the duty was reduced do you think it would interfere with the prosperity of the iron business in this country to such an extent as to cause a suspension in the business?—A. It would materially reduce the business, certainly.

By Commissioner OLIVER :

Q. What does it cost to put a ton of pig-iron on the market, say, from the furnace to the Cincinnati market?—A. The furnaces of the South have made a favorable rate with the railroads based on the cost of the pig-iron, and it varies. But the lowest limit from Chattanooga to Louisville and Cincinnati is about \$2.25 a ton, and it costs from that up to \$4 a ton freight.

Q. Is the quality of pig-iron produced in this State what is called "cold short"?—A. Yes, sir.

Q. Have you any Bessemer ores?—A. No, sir; none developed.

By the PRESIDENT :

Q. Do you regard the conditions as favorable for the making of iron in this State?—A. Yes, sir; I regard the conditions as very favorable.

The PRESIDENT. A very distinguished manufacturer of iron in New England once said to me that the conditions for producing iron favorably were expressed in one word, in the word *c-o-l-t*—coal, ore, labor, and transportation.

The WITNESS. That embraces them all.

Q. And these conditions are all prevailing in your State?—A. Yes, sir; they are.

Col. A. S. COLYAR said :

There is certainly a very decided change going on in the public sentiment of the South in regard to tariff questions, especially here in Tennessee. Up to a recent period our farming people were all in favor of free trade, with few exceptions. I think the statement General Jackson has made upon that subject is a very correct one; that in regard to the three great interests of iron, cotton, and wool the farmers of this State do not desire any change. Our people lately have been considering these tariff questions and discussing the effect of the tariff upon iron, wool, and cotton. So far as public discussions of the question have been had they have usually been pretty much on one side. The politicians were generally for free trade and the subject was discussed from that standpoint. But since the war all classes are coming to consider the question more fairly, and perhaps it would be difficult to find a more marked change in the sentiments of any community than is found here in regard to all these tariff questions. I think, from my interchange of opinion with business men, merchants, bankers, and others, that they are generally satisfied with the tariff as it is.

The iron interest is getting to be, in the minds of all our thinking people, one of the great interests of this country. We believe that Tennessee is to have in the future considerable commercial prosperity, and that, in a great measure, is to come from the development of our great iron resources. Those who have studied the subject think a change in the present tariff would illy affect our interests and the growth of this industry. We have found, from actual experiment, that having coal and iron ore in the same localities we can make iron cheaper somewhat than

they can in Pennsylvania, and, perhaps, if there was a reduction of the duty on iron we should in one way be benefited. Up to a certain point we could compete in the production of iron where they could not in Western Pennsylvania. I do not know so much about the other portions of the State. But certainly if the tariff on iron was materially changed it would tend to break up this growing industry in our State.

In talking with a gentleman connected with this industry a few days since he gave me some information that was quite surprising. He had control of perhaps five furnaces, and the trade of those five furnaces passed through his office and the aggregate of it came to more than the gross income received by the Nashville and Chattanooga Railroad, which is 500 miles long and which connects with the Chattanooga and Alabama Railroad, some 200 or 300 miles long. The aggregate gross income to the people, or to the State, through this one single iron office is much more than the gross income brought in by these large railroads. So that you see at once how important this iron industry is to us and to the entire community.

I think every one who has examined the matter believes that any material change in the tariff affecting this industry would materially affect our future growth and prosperity.

I think I may say we are fast becoming a tariff people. I do not mean to say that the great body or mass of our people yet approve of a protective tariff, for the question has not yet been discussed fully; that is, there has not been any general discussion of it, but our people are generally coming to consider two or three of these general questions. One is whether or not if we adopt the theory of free trade, or verge on the borders of free trade, our laboring people will not have to submit to a reduction of wages which will be on a plane with those received in England. Whenever that proposition is stated to them, as it is occasionally, I find there is but one sentiment on the subject, and that is that we cannot submit to such a reduction. Yet, it would seem, if the free trade theory was adopted they would have to submit to it. As that question is being discussed public sentiment is settling down in favor of a protective tariff, to some extent at least, although I do not mean to make the assertion that that is the sentiment of our people generally.

By Commissioner BOTELER:

Question. In *ante-bellum* times, when political parties were divided in this region between the Democrats and the Whigs, these issues in regard to the tariff were discussed at political gatherings and the people became very well informed in regard to the principal points at issue for or against a tariff. Has there been during the last thirty years any such discussions in this State, so that the people have been able to acquire any information on the subject?—Answer. No, sir.

Q. And the present generation has grown up without such information?—A. Yes, sir; without any public discussion of the question at all, except that some politicians on the stump have tried to show how we are oppressed by the tariff, and that side of the question has been presented without having anybody on the other side to answer it. I think public sentiment here will be unanimous that the tariff should be so regulated as to raise a revenue only sufficient for the support of the government.

By Commissioner UNDERWOOD:

Q. And in doing that protect incidentally the three great industries you have named?—A. Yes, sir. I think public sentiment would be in

favor of such protection as could be legitimately and properly exerted in favor of these great industries. I think it would be very foolish for us, just at this time, when we are waking up to the benefits derived from diversity of pursuits, to demand that all protection should be taken from American industries; because we are now just reaching the point where we propose to benefit ourselves by pursuing a course of diversified industries such as the North has pursued for many years. We are just beginning to realize that; we did not realize it before the war. If we are simply an agricultural people and nothing else, we shall grow poorer and poorer; but whenever we change and become, to some extent, at least, a manufacturing people we shall find our condition rapidly improving.

Mr. JAMES WHITWORTH, of Nashville, president of the Tennessee Manufacturing Association, said:

The manufacture of cotton goods in this city has in the last five years greatly increased, and it is now on a boom, so to speak. Mills are going up in various parts of the State, and especially in this city, to an extent that no man could have predicted a few years ago, and have been held to be sane. That is a pretty broad assertion, I know, but I believe I am speaking strictly within bounds. In regard to the three interests of cotton, iron, and wool, I feel sure that our people of every class would submit to almost anything to have these three interests fostered.

By the PRESIDENT:

Question. Do you mean by wool both wool and woollen manufactures?—Answer. Yes, sir. Of course we do not wish the tariff placed at a point where it will produce more revenue than is necessary, or even enable us to pay off our national debt too rapidly. I say develop the country first, and we can then pay off the debt more easily. I think the people would be in favor of abolishing the internal-revenue system and continuing of the tariff system; at least that is my idea of it. In a word, in the revision of the tariff, let it be so framed that the South shall have an equal opportunity with the North to develop its natural resources. We ask for nothing that shall be to their injury; we simply ask that we be put on an equality with the most favored sections.

Mr. LEONARD PARKES, of Nashville, said:

I desire to say a few words in reference to the wool-growing interests of this State. As merchants dealing in wool, we desire that the protective tariff be continued to encourage the raising of sheep and the production of wool and the growing of mutton and lamb. We desire, also, that the tariff be so fixed that the changes which now occur every few years will not be necessary. The continual changes in and constructions placed upon the tariff laws, work serious damage to our trade. There has been scarcely a year since we have been in the business that we have not been uneasy and apprehensive of the action of Congress in regard to the tariff on wool. As manufacturers of woollen goods, we desire the present tariff to remain as it is. We are just entering into the business as manufacturers, and upon our success depends, to some extent, the future manufacturing interests of this section. If we should lose money it would discourage others from entering into the business. We cannot manufacture goods at as low a price, even if we could obtain the wool as cheaply, as they do on the other side, on account of the higher cost of labor in this country. Labor is more expensive with us here than it is in the East; that is to say, skilled labor is. If the wool

which is raised in Australia and other countries should be brought to this country and admitted free of duty it would discourage our farmers so that they would stop the production, and it would affect the prices, also, of mutton and lamb. So I think, in the interests of the farmers, as well as for the future prosperity of this section of the country, the present protective tariff on wool is essential.

By Commissioner UNDERWOOD :

Question. We were told by a witness who came before us in Iowa that he thought the high tariff on wool had diminished the number of sheep raised in that State.—Answer. I noticed that statement in a St. Louis paper and I was surprised to see it. I am glad that some members of the Commission interrogated the gentleman upon that subject.

By Commissioner GARLAND :

Q. What is the condition of sheep husbandry in Tennessee?—A. It is growing somewhat. There is a disposition, though, to sell our lambs instead of raising sheep.

Q. What does that result from?—A. I think from the high prices paid for lambs for food. I think a lamb is worth now as much as the sheep with the wool on it after it has been kept for twelve months. In other words, the value of the sheep and the wool, say at its clip, is but little more than the value of the young lamb.

Q. How long has that condition of things existed?—A. Only for about a year or so. There seems to be a growing demand for lambs. As soon as a lamb gets to weigh about 60 pounds, it is sold, and driven to the cars and sent off to be slaughtered.

Q. You say, notwithstanding that fact, the number of sheep is gradually increasing in the State?—A. Yes, sir. Winter before last the season was very severe and we lost a great many, but this last winter they have done better.

Q. What does your wool clip amount to in this State?—A. I could not speak for the State.

Q. Can you tell what portion of the wool is manufactured in the State?—A. A very small portion; not one-tenth, I presume.

By Commissioner BOTELER :

Q. You are a manufacturer of wool?—A. Yes, sir; we are just beginning to manufacture here.

Q. As a manufacturer of wool I understand you to say you oppose any introduction of free wool from Australia?—A. Yes, sir; because I think that would injure the farming interests of this section. It would be cheaper, perhaps, for us to use foreign wools in the production of our goods; perhaps we could manufacture them a little cheaper. But if you remove the tariff from wools and woollen goods both, we would then be left where we were before, at a disadvantage to our farming friends.

By the PRESIDENT :

Q. What goods do you make?—A. We are making jeans.

Q. Do you find the system of manufacture which encourages the farmer and the manufacturer at the same time working well?—A. So far as I can see, it is; we have not been in the business long enough to judge, perhaps. I think my advantage is the farmer's advantage, and the farmer's advantage mine.

Q. Is not that the general sentiment of the country?—A. Yes, sir; and it is a growing sentiment.

ADAM WOOLF ET AL.

NASHVILLE, TENN., *September 20, 1882.*

Mr. ADAM WOOLF, surveyor of customs, Nashville, Tenn., addressed the Commission as follows :

I will state to the Commission that Nashville is a port of delivery only. We have had a great deal of trouble here for several years in regard to some of the customs regulations. In 1880 a law was passed making this a port where goods could come without appraisement at the outer port under the immediate transportation act. The Secretary of the Treasury ruled against Nashville, however, for the reason that we had no custom-house officers here except the collector, no appraiser to appraise the goods, and the business was not sufficient in his opinion to justify the appointment of an appraiser. We have not got credit for all the goods that should come to Nashville, because the duty is paid on them at New York City and the amount collected we do not get any credit for. The goods are compelled to come by bonded lines and there are only one or two bonded lines from here to New York. Oftentimes the rates of freight are cheaper by other routes not bonded, and the merchants therefore bring their goods by these other routes and pay duty at New York. Our Congressman has agitated the question, but we have not succeeded so far in getting Nashville made a port of entry where goods can come direct without appraisement. We have a custom-house here and plenty of room for the storage of bonded goods, and we have some bonded goods there which have come by bonded lines.

By Commissioner BOTELER :

Question. Have the statistics of the trade of Nashville been fully laid before the Secretary of the Treasury?—Answer. We have tried to present the case properly through our Congressman and have had much correspondence in regard to it. But there seems to be a prejudice against giving us what we ask; they say that our trade is not sufficient. The reason for that I have already stated: that the merchants are compelled to pay the duties in New York rather than to have any delay occur in their shipment or pay the difference of freight charged by these bonded lines. There are some of the importers here now, and I hope they will address the Commission on this point.

Mr. B. W. SPIRE, of Nashville, importer of crockery ware, said :

I have been engaged in importing crockery ware here for a number of years, and I find it very difficult to get crockery through the original ports of entry. It seems that the delay and inconvenience is caused by various conflicting interests. The manufacturers in England give to purchasers a discount of five per cent. cash on the other side. It is optional, however, with the purchaser whether he pays on the other side or on this side. If he chooses not to send the money over there, but to pay on this side, it has been customary for him to bill the goods to his agent in the East as though they had been paid for, taking off this five per cent. discount. When they arrive in New York it is to the interest of the manufacturer, and also to the interest of the collector of the port, to stop the goods from going into the interior. The col-

lector's interest consists in his commission on the collection of duties at the original port of entry, and the manufacturer's interest is the duty that he gets on the five per cent. I remember an instance where one hundred crates of crockery came to New Orleans consigned to Carroll & Co. Mr. Carroll, knowing that he had to have a custom-house power of attorney, wrote to Nashville for that power of attorney. It was furnished in proper form, as I supposed, but the officer discovered a flaw in it; he found that the word Carroll was spelled with one "r" instead of two. That was the only irregularity, and on that he ordered the goods back to the custom-house. For that simple reason they were charged 75 cents a crate for hauling each of those one hundred crates back to the custom-house; the custom-house officer received 25 cents a crate for putting it in the custom-house and 50 cents a crate for storing it (although it only remained there one day), also 25 cents for hauling it out again, and 75 drynige back to the steamer. There was all this trouble and inconvenience in getting the goods through to Nashville, and a great many others which it would take too long to mention. Those are some of the drawbacks in importing goods to the interior of the country.

I also think that there are many unnecessary and superfluous laws in connection with this matter. For instance, we wish to bring the goods to this point by the quickest and safest route possible, by a responsible railroad company. But the government says we shall not do so, because it is not a bonded road. The road is considered safe for commercial purposes, and bankers will advance money on products sent over that road. The value of products sent over the road is stated in the bill of lading, and I think it would be a very simple thing for the government to allow us to bring in goods in that manner.

Commissioner OLIVER. I think you misapprehend the meaning of the law in that respect. The government delivers the goods to the railroad company at the port of delivery, and requires a bond of them that they will take care of those goods until they reach the custom-house in the interior. It is the neglect of the railroad to give the required bond which causes you the trouble. All the great trunk lines of the East are bonded lines; all the roads that center in New York are bonded. I think the law is a wise one and that it would not be proper to change it.

The WITNESS. I do not see how there could be any loss to the government, because if the goods were totally lost the government would not ask any duty; it is only when they go into general use that the government wishes to collect the duty. There could be no danger except from loss by thieves, &c. The transportation company is responsible for breakage.

Commissioner OLIVER. I think the remedy could be obtained if the importers would bring in their goods for a time over these bonded roads, and then you could show by the increased rates of duty at this place that you had business enough to warrant the payment of an appraiser, and one would be appointed.

The WITNESS. I think there would be no difficulty in getting an appraiser to serve here without salary if it was necessary. If that is all there is in the way we could provide for it. But what I fail to see is why the government should require more protection for the duty on the goods transported from one government officer to another than one citizen does of another. All the transportation companies are supposed to be responsible for the safe delivery of the goods at the port of destination.

By Commissioner OLIVER :

Question. They have only lately become responsible, and the government takes care to make them responsible for the goods until they deliver them in the interior 1,000 or 2,000 miles. You are an importer of crockery, I believe?—Answer. Yes, sir.

Q. It has been recommended to the Commission that the mode of levying duties on crockery be changed and that a cubic measurement be adopted. What would you think of that?—A. I do not think that would be practicable or of any advantage to the importer.

Q. They say a crate will measure so much, and that the charge should be so much a cubic foot; that the crates average about the same, particularly in common goods, and they advocate that a compound duty be levied at a certain percentage ad valorem and an additional amount per cubic foot.—A. That would suit parties who are importing a very common class of goods, no doubt.

Q. The recommendation does not come from the importers, but from the manufacturers?—A. Well, they are equally interested in it.

By Commissioner GARLAND :

Q. Have you ever heard any charges made that your goods, or the goods in your line, were undervalued for the purpose of evading the payment of revenue?—A. No, sir; I never have.

There is another point I desire to call attention to, which causes a great deal of complaint among Western importers: In importing sets of goods, the custom-house officer at the original port of entry usually orders two packages of the importation, or possibly only one package, to be sent to the store for examination, and where the goods consist of these fine bed-room sets, or something of that sort, consisting of twenty or twenty-five pieces to the set, in almost every instance when we come to unpack the goods here we find many of the smaller pieces missing, which makes the whole set incomplete. We have no redress for this little pilfering, wherever it may occur. That, I think, could be avoided if the goods were shipped here direct for appraisement.

Q. Is it your impression that that loss occurs in the custom-house?—A. It occurs in the very package that they have taken out to examine.

Q. Is that a matter of general complaint?—A. Yes, sir; it is. I have heard it mentioned in regard to liquors, champagnes, and things of that sort as well.

Mr. C. A. R. THOMPSON, of Nashville, said :

We have made an experiment this season of importing fine silks and dress goods from France direct, but we have had a great deal of trouble on account of the detention of the goods in New York, and I think the appointment of an appraiser at this port would remedy the evil which we suffer. I have no doubt if an appraiser was appointed with the facilities for getting goods through rapidly the business of importing here would increase. In our line of business fashion determines the value of the goods. After the season passes by, of course the value of the goods is very much depreciated. Therefore it is important that we should get them through without loss of time. I do not know that I have any recommendation to make, except that I would suggest that some steps should be taken to hasten the delivery of goods sent from New York to Nashville.

We have an importation of goods lying in New York now that we cannot seem to hurry up. We have written to the Merchant's Dispatch

line, a bonded line, to hurry them through but they say that we have to wait our time, and give us no encouragement about it.

By Commissioner GARLAND :

Question. You are an importer of silks?—Answer. Yes, sir.

Q. Do you ever have your invoices advanced at the custom-house?

—A. The importation of goods is only a recent thing with us; I know that we do not get our goods through quickly.

Q. I am speaking of the advance on the invoices you import. Have you had any invoices advanced at the custom-house?—A. No, sir. In the case to which I allude the goods have not yet been appraised.

By Commissioner BOTELER :

Q. What is your idea of the comparative advantages of specific and ad valorem duties in your business; which do you prefer and which do you think the best?—A. I think ad valorem duties would be the best.

Q. Have you ever heard the idea advanced of valuation on this side of the water; that is, home valuation?—A. No, sir.

By Commissioner OLIVER :

Q. I would like to ask your opinion, as you come in contact with the people of this section, as to the views generally of the business men and merchants in regard to any radical changes in the tariff laws.—A. Ours is a retail business and I do not come much in contact with other merchants, and have no means of speaking authoritatively. I do not think there is much agitation on that subject in the State.

Mr. JAMES M. HAMILTON, of Nashville, said :

I merely wish to add my testimony to that of Mr. Thompson and Mr. Spire in regard to Nashville being a port of entry instead of merely being a port of delivery. I have been engaged in the importation of hardware in this city for nearly fifty years for myself and others, and have experienced all the difficulties that Mr. Spire has spoken of in regard to the delay of the goods in New York City, and also in New Orleans when we get goods via New Orleans. But while the quantity of goods imported now in the hardware line is much less than it was forty-eight years ago, when we commenced business, still it is a matter of great importance, I think. Mr. Woolf omitted to state one fact that the revenue duties paid by this place are not represented at all owing to the fact that they are paid at New York. Very little of the money paid for duties passes through his hands. And when the Treasury Department rules us out because the amount paid in by the city does not justify the appointment of an appraiser, it does us a very great injustice from the fact that the revenue we pay into the public Treasury is all reported through New York and the tax we pay is all put into the custom-house at New York, or nearly all of it. I believe that even the railroad iron and street rails that are imported in large quantities for building our railroads here have been reported to the New York custom-house and the revenues paid there. If we could receive credit for the amount of money which is absolutely paid into the public Treasury by the city of Nashville we should be entitled to be made a port of entry as well as a port of delivery. The government has built us a very handsome custom-house building and we have every facility here for transacting the business.

I want to say a word also in regard to the tariff. The tariff is high, and probably is yielding more than the government needs at present. I have thought on this subject a great deal. I believe it will be better

to let the tariff remain as far as possible as it is, and make as few changes as need be, from the fact that the country has become accustomed to paying a certain amount of revenue regularly and I do not think it wise to disturb the present system. What the hardware merchants want is stability; we do not want any change. We also suffer when any change takes place. The farmer pays a tariff on everything he buys, it is true, whether it is made in the United States or in England. When I first commenced importing hardware 95 per cent. of all the hardware used in the United States was brought from foreign countries. Now there is not 5 per cent. brought from foreign countries. So that the tariff has absolutely made us a great manufacturing people. Now that the people are accustomed to paying these tariff duties, why not let the matter rest; why not let the revenue be collected and applied towards paying the public debt?

By Commissioner GARLAND.

Question. You mentioned the fact that a certain number of years ago 95 per cent. of the hardware used in this country was imported, against about 5 per cent. that is imported now?—Answer. Yes, sir; that was in 1835.

Q. What was the character of the goods at that time compared with those at present in use?—A. The American hardware is very much superior to the foreign hardware.

Q. What is the difference in prices between that times and the present?—A. Prices have been reduced.

Q. The goods have been improved and the prices have been reduced by American manufacture?—A. Yes, sir.

By Commissioner BOTELER.

Q. And the farmer benefited to that extent?—A. Yes, sir. We used to import a very common shovel, used on the railroads, and all the picks, mattocks, and grub-hoes, chisels, augers, and all those things used on a plantation, and nearly everything.

By Commissioner GARLAND.

Q. But now you get better goods for less money?—A. Yes, sir; Mr. Henry Disston, the saw manufacturer of Philadelphia, has not only run the English saws out of the American market, but he has actually gone over to Sheffield and established an office next door to one of the largest English importers.

By Commissioner UNDERWOOD.

Q. Are we not extending our trade abroad?—A. Yes, sir; very largely. For instance, the agent for the saw company I speak of in England has shut up his office in New York and gone to England and opened an office for the sale of American hardware, such as locks and hinges, which are vastly better made in the United States, are handsomer and much better in every way than the English productions. Our spokes, hubs, and even iron axletrees are exported to England; they are made cheaper in this country than they can be in England under the patents. American goods are also shipped to Australia, and our axes, hatchets, and drawing-knives are sent all over the world. There is no nation that can make a hatchet or an axe as it is made in the United States.

By Commissioner BOTELER:

Q. Do you think the superiority of your industries in that respect is

to be attributed in any degree to the encouragement the manufacturers have received from a protective tariff?—A. Yes, sir; almost altogether. There is no doubt an impetus was given to the business by the protective tariff that was placed upon the foreign importation. It was in that way that the business was started.

Mr. GEORGE S. KINNEY, of Nashville, said:

In exporting whiskies we find a great deal of trouble because we have no government officer here to clear our whiskies to foreign ports. We have to send them to New York, and there consign to a commission merchant, and it takes eight to ten months for us to get the drawback on exported whisky. If we had like officers here, I presume we could get the same business transacted in two months at the outside. If this was a port of entry our goods would come directly to Nashville instead of having to be appraised at New York as at present. We have a growing trade in Nashville, and it is an important one, and the general sentiment of the people is that Nashville should be made a port of entry.

J. E. MACGOWAN ET AL.

CHATTANOOGA, TENN., *Sept. 21, 1882.*

Mr. J. E. MACGOWAN, of Chattanooga, addressed the Commission as follows:

I suppose the Commission would like to hear something of the general resources of this country, which consist almost exclusively of coal, iron, timber, and cotton. The iron interest of the South has been developed rapidly since 1869. There were a large number of failures in 1873 and 1874 in the furnaces and mills throughout the South. I can now think of but two mills that were built before or since the war that weathered the financial squeeze of 1873. There were a large number of failures in furnaces also. There has been an immense amount of money lost or wasted in the South in all branches of the iron trade. My observation leads me to think that it would not be to the interest of the South if the duty on pig metal were reduced. I should oppose an increase of the duty, but I think it would be unjust to the pig-iron interest to reduce it. A large amount of Scotch pig is used in the South. In Rome, Ga., there is a large amount of Scotch pig-iron used every year, and in New Orleans, Mobile, Savannah, and Macon, also, as well as a large amount in Memphis. One of the works there used a considerable amount of Scotch pig-iron. The last quotations, I notice, show that Cleveland pig-iron can be made at about \$7.50, put on the furnace bank at \$9.50, or for the best Scotch about \$13. Scotch pig-iron can be placed in New York, Philadelphia, Pensacola, or Mobile as low as \$17.50 to \$18 a ton. It cannot be made for that money in the South, taking a decade for the basis of calculations. Therefore the owners of the large coke-furnaces in Scotland could break down our charcoal men in the South completely. There is no question in my mind but what they could do that. We cannot make the average mill irons, or ordinary brands of pig in the South, taking, as I said before, a decade as the basis of calculation, for less than \$15 a ton, and they certainly can place theirs at the seacoast for something less than that, upon the average of the Cleveland and ordinary English brands of iron, which would confine our product here solely to the home market. We could not haul pig-iron to the coast and compete with them in the eastern and southern points of consumption in its manufacture.

Probably in bar-iron and all grades of the coarser forms of iron the tariff as it stands, while it may need some simplification and pruning, is not excessive. While I should not expect that a very liberal reduction in the tariff on bar-iron would bring in foreign competition seriously in the southern district, it would break down to a very considerable extent the bar-iron interest in the South by furnishing to mills in the eastern districts an article of pig at very much lower rates than we could furnish it from here. Therefore they would have a material advantage over us in bars, rails, and all the coarser forms of manufactured materials. I notice that the average price of steel rails at present is about \$48 at the mills. They can be put in New York at \$30 to \$32 to-day at a fair profit to the makers in England, and adding brokerage and other expenses they could be sold, under free trade I will say, at \$35 a ton. Our duty is \$28 a ton, and that would show that our iron-makers

(although we are told that these things are in the nature of bounties) are not getting within \$12 or \$15 of the bounty; the bounty is going somewhere else, probably to the government. That is true of all other articles protected in the iron interest. The duty is very seldom, if ever, added to the price of English iron, duty free, in New York, Philadelphia, or other controlling eastern markets; not much more than half, as a rule. That might or not indicate that one-half of the protection would be sufficient to answer the purposes of the southern districts.

By Commissioner UNDERWOOD:

Question. Is there an abundance of iron ore in this country?—Answer. Yes, sir; a very great abundance.

Q. Is it contiguous to coal?—A. Yes, sir; it lies very close to coal.

Q. Is it of a character that cokes easily?—A. Yes, sir; we have large amounts of good coking materials through the South.

Q. Is limestone abundant in the country?—A. Yes, sir.

Q. That is the flux you usually use?—A. Yes, sir. I have seen limestone, coal, and iron ore all within a circuit of a mile or a mile and a half.

Q. Are you aware of the difference in price of labor in this country and in Europe?—A. Yes, sir.

Q. What is the difference?—A. In the iron industry I think the difference is about 110 per cent.

Q. It is your opinion, then, that the American producer of pig-iron and such other forms of iron should have sufficient protection to put him on an even plane with the foreign maker in regard to wages?—A. That is my idea exactly, and I would say in that connection that in the pig-iron interest every dollar of the protection goes to the laborer.

Q. You do not think it desirable that the price of labor in this country should be reduced to the price of labor in England?—A. No, sir; I think not. The cost of living is quite as low as it is in Europe, and I think our laborers have a much better chance.

By Commissioner BOTELER:

Q. What do you know in regard to the sentiment of the agricultural portion of the community on this subject; have you any information in regard to their wishes?—A. Yes, sir; considerable. I am the editor of a paper which circulates largely in the agricultural districts here, and among the most intelligent agriculturists I find that there has been since 1874 a very rapid change in regard to all tariff questions. I think there is a growing sentiment in the community in favor of proper protection.

Q. There has been no agitation of that question for the last twenty years in the South, has there?—A. No, sir; but we have advocated a tariff for protection pretty rigorously, and our paper is taken and read by a large number of prominent agriculturists, and I take it that if our readers did not like the views contained in the paper they would be apt to say something to us about it, which they have not done. I do not remember hearing any criticism of our protection views, except from a few gentlemen who run small weeklies—"patent insiders." That class of people have sometimes criticised our views. There is a very general lack of information in regard to all these tariff matters in the South,

By Commissioner OLIVER:

Q. In your judgment, then, there is no great desire among the people to have any radical changes made in the present tariff laws?—A. I find no such desire among them. I know quite a number of gentle-

men who are importers and large dealers throughout the South who are pretty stiff democrats—pretty extreme—and I know several of those gentlemen quietly voted at the last Presidential election for General Garfield simply because they favored the doctrine of protection. I know quite a number of instances of that kind of my own knowledge, and these men were not manufacturers either.

Q. Are the people in this section generally in a prosperous condition?—A. Yes, sir; there is a very general condition of prosperity at present.

Q. Both among the farmers and the trading classes?—A. Yes, sir; our farmers are better off than they ever have been since the war.

By Commissioner BOTTLER :

Q. And they cordially welcome among them all those who are disposed to start new enterprises?—A. Yes, sir; there is no place anywhere where men with money are more warmly welcomed or better treated than in the South.

Q. You are from the North yourself, I believe?—A. Yes, sir; I commanded a Federal regiment during the war, and was mustered out here and have staid here ever since.

Mr. A. M. JOHNSON, of Chattanooga, representing the Lookout Rolling Mill, said: -

I am a Georgian by birth, but have been a resident of Chattanooga for about thirty years. I came here quite young, and have been connected with the iron business here only about three years. I am a novice in it yet, but have learned a great deal and have more to learn. I have listened very attentively to the statement made by Colonel MacGowan, who has been a resident here and editor of a paper for some time, and I fully agree to all that he has said in regard to our manufacturing and agricultural interests; his views accord with my own in all respects.

By Commissioner OLIVER :

Q. What is your opinion in regard to the wishes of the people of this section so far as any changes in the tariff laws are concerned?—A. I do not believe that the people here desire any reduction or any change in the tariff at all. I do not believe there is even a respectable minority who favor any change in the present tariff system.

By the PRESIDENT :

Q. Are you a manufacturer of bar-iron?—A. Yes, sir.

Q. Then you are a purchaser and consumer of pig-iron?—A. Yes, sir; I would not have the tariff altered or changed in any respect. There is now a legitimate margin of profit in the manufacture of pig-iron into bar-iron, and if we were to buy pig-iron for less money bar-iron would come down in proportion. There is a legitimate margin in competition and trade which will always bring the price down to a fair figure. If pig-iron was imported and the duty was less, or removed altogether, in order to enable the pig-iron manufacturers to produce their product here, the price of labor would have to be reduced also. I think labor is, if anything, too low now.

Q. Do you regard it as an advantage to yourself, as a consumer, that there are manufacturers of pig-iron here at your command, and domestic competition among the blast furnaces, so that you can get your pig-iron cheaper?—A. Yes, sir.

Q. Do you think you are better off than if you were dependent wholly upon the foreign supply?—A. Yes, sir. I would not have the tariff placed so as to enable the manufacturers to keep their prices up too high. I think the matter is very well adjusted, however, as it is at present. I would not have the pig-iron manufacturers get rich at the expense of the general interests of the country, but I think they ought to receive a fair share of protection. Although I am a manufacturer myself I would not, if I know myself, have the tariff placed at such a figure that it would enable me to get rich if at the same time it was impoverishing my neighbor. I think the interests of all classes should be considered.

Capt. H. T. CHAMBERLIN, president of the Roane Iron Company, of Chattanooga, said:

I can only repeat what Mr. Johnson has said, and indorse all that Colonel MacGowan told you in regard to the sentiments of the people in this section of the country on tariff questions. Ever since the war I have been in the iron business here, or in this vicinity. I first went into the business at Knoxville, Tenn., directly after the war, and engaged in making bars, railroad stock, &c., and afterward came to Chattanooga, and have been in business here making pig-iron and rails. My opinion is, so far as my observation goes, that the present duties are perfectly satisfactory both to the manufacturer in my department of the business and to the people in this section. This is not what might be called a free trade district or section. I think the sentiment here, among all classes of people, is pretty fairly unanimous. While there are quite a number who would say, on general principles, that they were in favor of free trade or in favor of a tariff for revenue only, yet when they are pinned down to a statement of their views they all agree in the benefits conferred by a judicious protective tariff. The iron interest is the principal interest of this section of the country, comprising Chattanooga, Birmingham, Knoxville, and quite a district about here. There are quite a number of blast furnaces in this section. The ore is plentiful, coal is abundant, and the people engaged in these industries are generally fairly prosperous at this time. I think that is true of this whole section. We had a pretty severe time during the panic, as other sections of the country did, but we have about gotten over the effects of that and are now in a prosperous condition. I do not think there is any feeling against the present tariff on iron or iron products amongst the agricultural portion of the community.

By Commissioner UNDERWOOD:

Question. Are you acquainted with the iron works of Noble & Tyler at Anniston, Ala.?—Answer. Yes, sir.

Q. How much iron are they making?—A. Somewhere about 40 to 50 tons a day of charcoal iron.

Q. Do you know whether they have a cotton factory also?—A. Yes, sir, they have a cotton factory as well.

Q. What is the size of the town they have built up?—A. I do not know that I could speak authoritatively on that subject, but I have heard it estimated at 2,000 people.

Q. They have churches and schools there?—A. Yes, sir; both churches and schools built by themselves.

Q. And women and children work in the cotton factory and the men in the iron works?—A. Yes, sir; that is the case. I was talking with Mr. Noble yesterday about it.

Q. Are you acquainted with General Warner's establishment at Te-cumseh, just over the line?—A. Yes, sir.

Q. How is that establishment prospering?—A. I think they are doing well at present, although they have had a pretty hard time of it.

Q. Did General Warner go through the panic of 1873 safely?—A. Yes, sir; he did, and the sheriff has not got him yet.

Q. Are you acquainted with the Etna Works, now run by Colonel Pennington in Polk County, Georgia?—A. Yes, sir. They are doing well also, I believe.

Q. Have you any acquaintance with Captain West's works at Cedartown, Ga., 20 miles south of Rome?—A. Yes, sir; I know of him. He is doing well, and has built a very nice town there.

Q. Has he not afforded a very good market there for the agricultural products of that part of the country?—A. Yes, sir; and he carries on a large farm, a grist-mill, and saw-mill. He has built up large industries there in several directions.

Q. The establishment of his works there has more than trebled the population of the town, has it not?—A. Yes, sir; it has.

Q. Are you acquainted with the iron works at Round Mountain, Ala.?—A. No, sir; I am not.

Q. Do you know the quality of the ores about Round Mountain; the red phosphorous ores?—A. Yes, sir.

Q. Are they valuable ores?—A. They are good ores, but not considered the most valuable.

Q. Are they not very useful in mixing with iron made from the hematite ores for making car-wheels?—A. They are so considered. They are mixed largely.

Q. Do you know Mr. Noble's establishment at Rome, Ga.?—A. Yes, sir.

Q. Is not that establishment making a fine quality of car-wheels?—A. Yes, sir. The wheels made there have a very fine reputation, and they are being used all over the country.

Q. Do they find a ready sale for all they can make?—A. I do not know how that is, but I know they have built up a large business there.

Q. From Chattanooga to Birmingham, and from Chattanooga to Mr. Noble's works in Alabama, is not the country filled with valuable classes of iron ore?—A. Yes, sir. There is a vein of ore called there the Clinton red fossil ore, which extends through Pennsylvania and southward, and enters this State at Cumberland Gap within sight of Chattanooga, and runs down along the Alabama and Great Southern Railroad to Birmingham, and loses itself below Birmingham. It is called a vein of red fossil ore. To the southeast of that there are occasional crops of the same ore. For instance, here is Lookout Mountain. On one side of it the Alabama and Great Southern Railroad runs along, and that ore crops out on that road the whole length of it, while on this side the same vein dips under the same mountain and extends for 100 miles or more.

Q. Is there not on the other side of the Coosa River fine beds of hematite ore?—A. Yes, sir; and it crops out occasionally in ridges throughout the whole Tennessee valley.

Q. Do you know whether they have found manganese in Barton County towards the lower edge of Floyd County and the upper edge of Polk County?—A. Yes, sir; they are shipping manganese ore from there.

Q. Are you acquainted with the ores in Taylor's Ridge, beginning with Ringgold and running 50 miles to the Coosa River?—A. Yes, sir.

Q. Is it not a continuous body of good iron ore for at least 50 miles?
—A. Yes, sir.

Q. Are there not large forests of timber suitable for the making of charcoal all along that line?—A. Yes, sir; I suppose not over 10 per cent. of the ridges in the vicinity of these iron ores are cleared. The land is all in timber, especially in the Alabama district. Of course you understand that these are not Bessemer ores.

By Commissioner OLIVER:

Q. What does this ore you have spoken of yield in iron?—A. They run from about 35 per cent. to about 55 per cent. Taylor's Ridge ores run up to about 50 per cent., and on the Southern Alabama road they run from 35 up to 55. I should say that 45 was about an average.

Q. How are they in phosphorus and silicon?—A. The vein that runs west to the Cumberland Mountains produces a pig-iron of about 85 of phosphorus, and as you go south on this vein the phosphorus is less, and when you get down in the neighborhood of Birmingham there is a little less phosphorus than there is in this section of the country. There is more alumina here and more silicon in that country. It is not excessive in alumina or silicon, and makes a good cold-short iron. Each of these veins I have spoken of seems to be a little different from the other. On this side of Lookout Mountain there is less phosphorus than the other side. I cannot say why that should be so.

By Commissioner GARLAND:

Q. In speaking of the agricultural classes of this section, I understand you to say that they are generally satisfied, in your opinion, with the tariff upon the manufactures of iron. Can you give us some idea of their feeling with regard to the tariff on other manufactures?—A. In regard to that matter I may say that I have traveled over this section of the country very considerably, looking for ores in North Georgia, Tennessee, and Kentucky, during the last ten years, and have seen a great many people in the agricultural districts, and have conversed with them frequently on tariff questions, especially with regard to the tariff on iron. I never have heard any dissatisfaction expressed by any of these people in regard to the present tariff.

By the PRESIDENT:

Q. These ores which you refer to are secondary ores. Are there any primitive ores or magnetic iron ores?—A. There is a large vein of magnetic ore on the border where North Carolina and Tennessee join, which is in what is called the Greenboro' district, about 200 miles from here. It does not come very near us. There are no primary ores that we know of nearer than 200 miles, I suppose, from this town.

Q. I have heard a great deal of the ores of Alabama; what kind of ores are they?—A. They are brown hematite and phosphorus ores generally. In this section the ores are phosphorus ores, while in Alabama they are more generally brown hematite ores. The hematites are very generally used for making car-wheel iron, but would hardly make a stronger iron than certain of these phosphorus ores.

Q. Are they as easily worked in the furnace?—A. About the same as the other; not more so.

Q. Are the materials for making charcoal iron in Georgia or Alabama in the regions you have referred to very great or almost unlimited?—A. I think they are very great in Georgia, Alabama, and in certain sections in Tennessee. I will state that I called on Major O'Brien, the president of the board of trade here, and asked him to bring the

representative free-trade men of this place with him to give their views to the Commission on that side of the question, but I am sorry to say that they have not responded.

Mr. S. B. LOWE, commission merchant of Chattanooga, Tenn., said :

I endorse all that has been said by those who have preceded me. If I should address the Commission, it would only be a repetition of what they have told you, and therefore I will not at this time make any statement, but if any of the Commission desire to interrogate me I should be happy to answer their questions.

By Commissioner UNDERWOOD :

Question. Do you agree with what Captain Chamberlin has said in regard to the iron ores of this country, especially with regard to their extending from here to the county of Floyd, and down by Tecumseh, to Noble & Tyler's Iron Works?—Answer. Yes, sir; I do. I have made personal inspection of many of the ore banks through Alabama and Georgia both. There is a difference between the brown hematite ores and the red fossiliferous ores, as we designate them here. The brown ores have more manganese mixed with them than the red ores.

By Commissioner OLIVIER :

Q. That helps to make a softer iron, does it not?—A. My impression was that manganese in iron made it harder, but that may not be so. It is an iron that comes to nature quicker than the other. I have seen two or three beds down in Tennessee where there was 50 per cent. of manganese, which would make a white iron. There seems to be an almost unlimited supply of ore through this section of the country. To express my idea about it, I will repeat a remark made by Mr. Powell, who went through this section of the country investigating the different qualities of ore. Some one asked him as to the extent of the ores through this country, and he said that he had been making calculations upon that subject, and as near as he could ascertain there was enough ore through this section to last the whole world for five or six eternities; that was the expression he used. The supply of iron ore throughout this country is almost unlimited.

By Commissioner UNDERWOOD :

Q. Are you acquainted with Taylor's Ridge?—A. Yes, sir. I have worked a great deal of ore from there.

By the PRESIDENT :

Q. You seem to be familiar with ores. Are you familiar with the brown hematite ore of Connecticut?—A. No, sir; only with the iron itself. I know of it.

Q. It was pronounced by La Place, the most eminent geologist in the world, as making the best iron known. I would like to know whether the hematites of Georgia compare with it?—A. I can tell you of an ore bank (and I suppose there are plenty of them in Tennessee) called the Tellico ore bank, which is situated 60 miles from here, in East Tennessee. Some forty years ago there was a charcoal furnace that used that ore. That iron was brought here to Chattanooga and made into car-wheels here and at Nashville, at least forty or fifty years ago, and about ten years ago some of those wheels were still being used on the Nashville and Chattanooga Railroad. I think that is unprecedented in the history of car-wheel manufacture anywhere. It was the strongest iron I ever saw.

By Commissioner UNDERWOOD:

Q. Are any nails manufactured here?—A. Yes, sir; they manufacture about 500 to 700 kegs of nails a day.

Q. Is the quality of iron used suitable for the making of nails?—A. Yes, sir; I think so, very suitable indeed.

Q. Do they make a nail as good as the Old Dominion nail?—A. Yes, sir; I think so.

Mr. CHARLES D. MCGUFFEY, of Chattanooga, said:

I have no practical knowledge of iron, but I have lived sixteen years in this part of the country and have a pretty thorough acquaintance with its natural advantages. I have traveled a good deal, and had a good opportunity for ascertaining the sentiments of the people on tariff and other questions, and believe the opinion of the agricultural class is favorable toward a continuance of the present tariff, especially in those sections where they have been brought within the influence and have seen the practical workings of the iron factories established in this State. I know of the growth of Rookwood and Oakworth, two furnaces that were located in the wilderness, and now they are surrounded by a growing and thriving population. As far as I can ascertain the farming class do not like direct taxation; they prefer another form of taxation. During the sixteen years I have been in East Tennessee I have traveled considerably through the country on horseback and in remote agricultural regions, as well as in the mining districts, and I do not remember ever to have heard a word of complaint about the tariff, although I have heard complaints on many other subjects during that time.

As to the manufacture of iron, which is the principal industry throughout this section, I am sure that it would excite much dismay among the agriculturists if there was a prospect of anything being done in connection with the tariff which would interfere with the iron interests. Land that was comparatively of no value before these establishments were erected now bring a good price; the farmers have sold their ore rights and their timber, and men with small farms who before could hardly get along find themselves in a condition of comparative competence. These tariff questions are not very well understood among our people generally, I think, as they are not brought directly in contact with the workings of the tariff law. As far as I have been able to ascertain there is no desire for any change in the tariff among the people of this section of the country.

Mr. LUKE LEE, of Jackson, Miss., said:

I do not know that I can consider myself a representative of the views of the people of my State, but I understand that the Commission would like to be informed as to the public sentiment on economic questions pertaining to tariff matters in Mississippi. I can only say, in a general way, that in Mississippi, apart from the professional politicians, there is no dissatisfaction felt in regard to the tariff. Our newspapers and our politicians mostly advocate free trade, but I am satisfied that there has been a change in public sentiment in regard to these matters. I think the sentiment is increasing in favor of a general policy of protection. We have some few manufacturing establishments in Mississippi, but we have no mineral resources. It is very strictly an agricultural country. Some manufacturing establishments have sprung up of late, and are doing a most excellent business. There is a large cotton

and woolen mill at Wesson, on the Chicago, Saint Louis and New Orleans Railroad, between Jackson, the capital of the State, and New Orleans, known as the Wesson Mills. It is mostly owned by Colonel Richardson, a man of great wealth, and who is perhaps the largest cotton planter in the world. He owns, I suppose, some eighteen or twenty large cotton plantations in what is called the Mississippi Delta, and raises more cotton than any other man in Mississippi or in the South. He told me, not a great while ago, that his investment in his cotton and woolen manufacturing establishment, at Wesson, was far more profitable than his mining investments. He is now engaged in erecting at Vicksburg a large oil mill, being the second one erected there.

I think the people of the State of Mississippi appreciate the advantage of having manufacturing industries established among them, although as a rule the people in the agricultural districts are indifferent on the subject of the tariff, never having investigated it, and they know or care but little about it. The politicians are generally in favor of what is called free trade. I should not be surprised if in the course of a few years we had an entire revolution of public sentiment on this subject, and a feeling in favor of what might be called a protective tariff.

By the PRESIDENT :

Question. At this factory that you speak of, established by Colonel Richardson, what are they manufacturing?—Answer. Principally jeans.

Q. Do you know anything about the character of those fabrics?—A. They are very good quality and are sold in New York.

Q. I believe their extraordinary cheapness was spoken of at the Centennial Exposition.—A. Yes, sir. They are making a variety of these fabrics, which they send mostly to the North and Northwest. There is quite a demand for them in New York, I am told. I think there is a growing desire to see these tariff questions placed upon a footing that will give us prominence and prevent the tariff from being subject to incessant changes and agitation. The idea seems to be that it does not matter so much what the duty is, as long as it is a fixed and stable one; that the business of the country will adapt itself to the tariff, and that as we have to raise a revenue to carry on the government, the people prefer to have it raised in that way rather than by internal taxation. I think there is a feeling among our people in favor of abolishing the internal-revenue system, and collecting the revenues of the government from imports. If that is the policy to be adopted, and the tariff can be adjusted and put upon a permanent basis, I think it would be satisfactory to the people of the section of the State where I live.

Mr. W. S. MARSHALL, of Chattanooga, said :

I desire to call the attention of the Commission to the development of the tanning industry in Tennessee. Messrs. J. B. Hoyt & Co., of New York, have established a tannery here, and have met with good success. It was established here because of the large quantity of chestnut-oak bark of good quality for tanning purposes to be obtained in this vicinity, and they have been increasing their capacity until now it is one of the largest tanneries in the United States, if not in the world, with a capacity of tanning about 400 hides a day. They purchase their hides in New York, Philadelphia, Baltimore, and other Eastern cities, and ship them here and tan them, and ship them back to New York. They get their bark along the line of the Alabama and Great Southern Railroad, which runs into the northern part of Alabama, and along the line

of the Cincinnati Southern Railroad. Each of these roads run close to the mountains where they get their bark. They pay now from \$6 to \$8 a cord for the bark, delivered on the road. That furnishes employment and capital to the farmers, and to the persons living on these poor lands along these roads, where the land is almost worthless in other respects. I believe the land on the sides and tops of these mountains has only been worth on the average, about \$1 or \$2 an acre, until now.

The people bringing bark down to the railroad station, sometimes a distance of 10 or 15 miles, are getting more for their bark than their land was worth before, with the timber on it. I know of one man in an adjoining county that bought a piece of land on a side of a mountain, for which he paid \$3,000 a few years ago. He is a farmer in Ray County. A few months ago he sold the bark standing in the tree to this tannery here off that same piece of land for \$11,000 cash, and he also contracted to deliver the pine timber standing there for \$1,000, and has the land with coal in it yet. There is a large amount of this chestnut-oak bark, and since this tannery has been in operation here it has called the attention of the tanners in other parts of the country to this bark, and it has been shipped from here to Louisville, Cincinnati, and Saint Louis for the last two or three years, so that it has made a great deal of business for this region of country.

I notice an improvement also in those localities where iron manufacturing companies have been located within the last few years. They have been located in sections where the people were not very extensive farmers, where the land was not productive, and they had but little market for anything that they produced. But where these factories have been established towns have grown up, the people find a market for all they have to sell—their butter, eggs, cheese, &c. The markets are being brought to the doors of the farmers; and, so far as I can see, the farmers are very anxious to have these establishments located among them. I find in such cases a very decided change in the sentiments of the people, and that they are almost universally in favor of a tariff, not only a tariff for revenue, but a protective tariff.

By the PRESIDENT :

Question. Is the southern chestnut-oak to which you have alluded, superior to any other kind for tanning purposes?—Answer. It is superior to any bark that can be found in the North. Before locating here Messrs. J. B. Hoyt & Co. had a person employed to travel through the country to find out where the best quality of bark for tanning purposes was located. They are the largest tanners in the United States, and have four or five tanneries besides the one established here. They investigated the question thoroughly and thought they found the best bark here, and experiments have proved their supposition to be correct.

J. A. HUTCHISON.

ATLANTA, GA., *September 22, 1882.*

Mr. J. A. HUTCHISON, of the firm of Hutchison & Bro., druggists, Atlanta, Ga., addressed the Commission as follows:

I desire to say a few words to the Commission on the subject of quinine. The price of quinine is cheaper now than it has been for a number of years, and in my opinion that has been brought about entirely by taking off the duty on quinine. We now get the French and German quinine, and other firms have commenced making quinine in this country that were not engaged in that manufacture before, and these new houses have come in competition with the old firms such as Powers & Weightman, who are now asking to have the duty on quinine reimposed.

By Commissioner BOTELER:

Question. You do not recommend then the reimposition of the duty upon quinine?—Answer. No, sir; it should not be imposed, if you desire to furnish the article cheaply to the consumers.

Q. A great deal of quinine is consumed in this part of the country, I believe?—A. Yes, sir.

Q. And you say it is cheaper now than it has ever been?—A. Yes, sir; it is cheaper now than it was before the war.

Q. Are you making as much profit out of it as you were formerly?—A. Yes, sir; we are making more. The price was so high before that we could not make much profit. Now we only pay \$2.50 an ounce, instead of \$4 an ounce, as formerly. Quinine has been sold here as high as \$5 an ounce since I have been in the business.

Q. So that you think that with a tariff as it is at present it is an advantage to the consumer of quinine, better for the retailer, and not very injurious to the manufacturers?—A. I don't think it hurts them a particle, for more people have gone into the business of manufacturing it since the duty was taken off than before. The firm of Powers & Weightman, of Philadelphia, had almost the control of the business before the duty was taken off.

By Commissioner GARLAND:

Q. What is the difference in the retail price of quinine now and a few years ago?—A. It is now worth 1 cent a grain; before it was worth 2½ cents a grain. We give 5 grains now for 5 cents, while before it cost 10 or 15 cents for 5 grains.

Q. That is a reduction of over 100 per cent. on the retail price?—A. Yes, sir.

Q. Then the removal of the duty of 20 per cent., you think, has reduced the price over 100 per cent?—A. Yes, sir; and we make more money on it now than we did before. A great many of the druggists keep the German quinine, which is cheaper than the American quinine.

Q. What is your opinion in regard to the present duty on bark of which quinine is made?—A. I don't know anything about that, but the

supposition is that if the duty was taken off that quinine would be even cheaper than it is now.

Q. Would you recommend that the duty be taken off the bark?—

A. I think it would be an advantage to our manufacturers in this country.

Q. In other words, you mean as long as the article of quinine is admitted free the material of which it is made should be admitted free?—

A. Yes, sir; I think so; and I think it would make the price of quinine still cheaper, which is what we want.

JAMES W. ENGLISH, ET AL.

ATLANTA, GA., *September 22, 1882.*

Mr. JAMES W. ENGLISH, mayor of Atlanta, addressed the Commission as follows :

I have but a word or two to say upon the subject of the tariff. I am very decided in my convictions in regard to these tariff questions. I do not believe the Southern country can ever become the prosperous section we would like it to be if it relies wholly upon agriculture. We have started many manufacturing enterprises, and we have got to have protection or else we cannot compete with the manufacturers of Europe and the New England States. In past times the Southern people were disposed to take the other side of the question in favor of free trade, as they have been engaged almost wholly in agricultural pursuits. But of late years large manufacturing industries have been started here, much capital has been invested, and skilled labor employed, and I think the sentiment of the people is that these establishments should receive the necessary protection in order to make them successful. I hope to live to see the day when the South will manufacture the greater portion of her own products in her own factories. When that condition of things exists, our people will find ready and profitable employment. There are here, as you will find in many sections of the country, people averse to agricultural pursuits, who would rather turn their attention in other directions, such as manufacturing and the mechanical arts. Up to this time there have been no such opportunities, but under the new start taken in manufactures here there is a large field for development. Of course the agricultural people as a class take the other side of the question, and are mostly in favor of free trade. But I have given you my own views of the matter, and I think I may say they represent the views of a considerable portion of this community as well.

Maj. B. E. CRANE, of Atlanta, president of the Chamber of Commerce, said:

I had not intended to say a word when I came here to-day, and will not now attempt to discuss the general principles of the tariff, simply stating that I differ from Mr. English in the views he has expressed. There is one matter, however, which as a merchant I should be glad to call your attention to, and that is the matter of the duty on iron ties for baling cotton. I observe in the newspapers that that question has been brought before your Commission, and as we are largely engaged in handling these ties I may possibly give you a few points upon that subject.

The present ruling of the Treasury Department is that iron ties shall pay a duty of 35 per centum ad valorem. The law, I learn, is somewhat vague, and there has been occasionally a ruling that they should pay a specific duty of 1½ cents a pound. The ties are put in bundles weighing from 50 to 56 pounds each. They cost in England about \$1 a bundle, or in the neighborhood of 2 cents a pound. The duty of 35 per centum ad valorem makes a bundle of ties cost at our ports \$1.35, and they are being sold to the planters now at about \$1.50 to \$1.55 a bundle. A

specific duty of 1½ cents a pound would make us pay a duty of about 75 cents a bundle, which added to the original cost would make the price \$1.75 delivered at our sea-ports. In other words, it would put an additional tax on iron ties of between 40 and 50 cents a bundle, or about three or four million dollars for the entire crop of the South, which has been estimated at six million bales. The duty of 35 per cent. ad valorem we have ought to be a sufficient duty on these ties. Any additional duty is really a tax on the cotton planter.

I have heard it said that it made no difference what the planter paid for his ties; that he bought his ties for about 3 cents a pound and sold his cotton for 10 cents a pound, and the cotton and ties were all weighed together. That would appear at first sight to be true, but really it is not the fact. For commercial convenience, we weigh a bale of cotton here and pay for the gross weight. When that cotton is landed in Liverpool and sold, 6 per cent. is deducted for the tare, just as 10 per cent. is deducted for tare on New Orleans sugar. We regulate that matter here, not by taking this 6 per cent. off, as they do on the other side, but in the price of cotton. Therefore, the cotton planter does not get any allowance for the weight of the cotton tie and the bagging, as has been stated.

By Commissioner UNDERWOOD:

Question. Cotton ties are used entirely for the purpose of preparing cotton; an agricultural product for shipment?—Answer. Yes, sir. In former years we used rope for baling cotton, but iron has replaced rope since the war, for several reasons. One is it is cheaper, and in case of fire it protects the cotton very much better than the rope tie did.

Q. And therefore reduces the insurance?—A. Yes, sir.

Q. The 6 per cent. that is deducted in Liverpool is the tare on the ties and bagging?—A. Yes, sir.

Q. So that, in fact, the cotton is sold in Liverpool net—by its actual weight in cotton?—A. Yes, sir; the same as sugar or anything else.

By Commissioner BOTELER:

Q. Which do you prefer, a specific or an ad valorem duty?—A. I prefer the ad valorem duty of 35 per centum, as is levied now under the present ruling of the Treasury Department.

By Commissioner OLIVER:

Q. There have been several rulings upon that point?—A. Yes, sir; and in a very few instances, I believe, a specific duty of 1½ cents a pound has been paid. But they have changed that now and they require that the buckle which used to be just slipped on to the band shall now be riveted to the band, and in that way they come under this ruling of a duty of 35 per centum ad valorem. I am not well enough versed in tariff matters to be able to give you the reason why that was done.

Commissioner OLIVER. It is wholly a matter of decision in the Treasury Department, and has been changed several times within a few years, and the duties are now collected under a decision of the Treasury Department putting these articles under the "not otherwise provided for" clause. Another decision next year may put the duty back again to 1½ cents a pound. Don't you think a specific duty should be named by law?

The WITNESS. Yes, sir; I think in trade everything ought to be made as permanent and stable as possible. I do not think the duty should be at a higher rate, however, than 35 per centum ad valorem. I do not

know whether that is enough protection to the American mills or not, but I think it ought to be.

Q. It has been stated to us that ten years ago the duty of 35 per centum ad valorem amounted to about $1\frac{1}{2}$ cents a pound.—A. Ten years ago cotton ties were sold at 8 cents a pound, while they are now sold at 3 cents a pound. The difference in the price of iron ties was caused not only by the protection which was afforded, but by patents which existed at that time. Those patents have expired, and hence the article can be made by any manufacturing establishment at present.

Q. Is it not a fact that at that time the cotton-tie business was in the hands of what might be termed a great monopoly?—A. It is now practically.

Q. I mean did not an English firm or syndicate control that manufacture and deal out the ties to the cotton planter in such quantities and at such prices as they thought the trade could stand?—A. No, sir; I think not; I may be mistaken. My information is that the iron-tie trade of this country is in the hands, practically, of Mr. McComb of New York City. Under this ruling of the Treasury there is enough competition coming in from abroad to keep his prices down. The patent was the only thing that protected him when the prices were high.

Q. Is it not a fact that in the "70's" he was compelled by the American manufacturers to reduce his prices nearly one-half by competition?—A. I do not recollect. The price of ties has been gradually declining. The parties who owned and controlled the patents made a very handsome profit out of them, I imagine, and got very high prices. As we have introduced, however, other modes of fastening the band, there has been competition which has gradually cut down the prices until now they are low.

Q. There are no cotton ties made in this country at all now, so we were told the other day.—A. They were made in this country two years ago, I believe.

Q. Do you think it a wise policy in regard to an article that is absolutely necessary for the use of the Southern people that the duty should be placed at such a figure that we have to depend upon a foreign country entirely for our supply; do you think it a wise public policy to do that?—A. I do not know how to answer that question. I cannot say that it affects us injuriously.

Q. The fact is that the whole supply of cotton ties comes from England.—A. Yes, under this 35 per cent. ad valorem duty; but with $1\frac{1}{2}$ cents a pound specific duty, none would come from England.

Q. But I ask you if you think it a wise public policy for us to have the tariff at such a figure that the home manufacturer is discouraged and we are obliged to depend upon the foreign manufacturer altogether for our supplies?—A. Yes, sir; unless our own American manufacturers will make them cheaply.

Q. Don't you think it would be better to stimulate the production in this country to some extent, so that they could be made here?—A. I do not think one section of the country where the ties are used ought to be taxed for the benefit of the other section of the country where they are made. These ties are only used in the South, and this tax is levied for the benefit of Pennsylvania and Ohio manufacturers. I understand there are ties manufactured in Alabama this year at the present prices. There is a small mill over there which has been making ties for several years, and which is making them this year, I understand.

Q. Under the old arrangement, when ties cost 8 cents a pound, the ad valorem duty of 35 per cent. was a very heavy tax; but prices might

increase again. In that view, do you think it wise policy to put the duty at a specific rate per pound; is it not your opinion that that is the best way of assessing the duty?—A. I had not thought of the matter in that light, and am not prepared to answer.

By Commissioner UNDERWOOD:

Q. Is not this tax upon cotton ties a tax upon the productions of one section of the country alone?—A. I think so.

Q. Do you believe that the removal of the tax would reduce the price of the ties?—A. I know it would reduce the price of the ties.

Mr. JONATHAN NORCROSS, of Atlanta said:

I have been in the South ever since 1830, and I have seen the time when it was almost as unpopular for a man here to announce himself as in favor of a protective tariff as to announce himself in favor of anti-slavery. I mention this to show that there has been a great revolution in the sentiment of the people of the South in regard to these tariff questions. At the present time, from my observation and from what I have read in the papers, and the speeches I have heard given, I think the sentiment of the majority of the people of Georgia is in favor of a reasonable and just protective tariff, although I do not think they believe in a high protective tariff. The people are beginning to see that they can benefit themselves pecuniarily by a discriminating protective tariff on everything that is manufactured out of cotton and iron particularly. I think, however, on one point the people of this section all agree, and that is that there should be an intelligent revision of the tariff. I think when a tariff yields a revenue sufficient to pay all the expenses of the government, and give a surplus besides, then the tariff on some articles ought to be reduced, while perhaps on others it ought to be advanced; in other words, there should be a revision.

By the PRESIDENT:

Question. I believe you are one of the oldest residents of Atlanta?—Answer. Yes, sir; I claim to be one of the oldest residents; I came here thirty-eight years ago when it was all woods around here.

By Commissioner BOTTLER:

Q. There has been no agitation of the question of the tariff since the war in this section?—A. No, sir; there has been no general discussion of it.

Q. Under the old system which obtained here before the war, these questions were generally discussed on the stump, and the people had an opportunity of being educated in regard to them, did they not?—A. Yes, sir.

Q. While the present generation have not had any such opportunities of obtaining information upon the subject?—A. No, sir. I think the people of this section of the country are lamentably ignorant in regard to tariff questions. Georgia at present is going extensively into manufacturing operations, and it is apparently her desire to take advantage of the present tariff and reach a state of financial prosperity by the method that New England has adopted.

Q. Then you think it is a growing sentiment among the people here that there should be some protection to encourage the development of American products as against those of foreign countries?—A. Yes, sir; I think so. As an evidence of that, I refer the Commission to the tariff speech made by Governor Brown in the Senate last winter.

By Commissioner UNDERWOOD:

Q. Do you think there is any general sentiment in this State in favor of retaining the tariff on cotton-ties?—A. Yes, sir, I do; although I cannot tell you how extensive it is, because I am not now actively engaged in business. I have heard men say, "If we must pay a tax to support the government may we not as well pay it in a tariff duty for the benefit of New England as to pay it for the benefit of old England?"

Q. Do you think that the tariff on cotton-ties, if it was reduced, would be a governmental act in favor of old England?—A. I do.

Q. What makes you think so?—A. Because they would furnish them so cheaply that we could not produce them here at all.

Q. That might be; but would not the cotton planter get his ties cheaper?—A. I doubt if he would get them so cheap.

Q. How would New England be injured?—A. New England would be cheated out of the profit, if there was any profit. If that was the only section of our country where they were manufactured, she would lose by it.

Q. But suppose New England does not manufacture iron?—A. I am only giving New England as an illustration. I do not think iron ties would be manufactured in New England whether there was a tariff or no tariff. I think cotton-ties are going to be manufactured in the South, amongst ourselves, if we have a little protection to start us. We have cheaper coal and iron, labor, and provisions than they have in any other part of the country, and I cannot see any reason, if we are given a little chance, why these cotton-ties could not be wholly manufactured here at the South.

Q. Do you think our labor at the South is cheaper than it is in England?—A. No, sir; not cheaper than it is in England, but cheaper than it is in New England. Our common laborers do not get as much, and many of the mechanics work for less wages than they could get in New England. The cotton-factory operatives do not get paid more than half as much here as they do in New England.

Q. They have strikes in New England occasionally, don't they?—A. Yes; I suppose so.

Q. Then why do they not strike here?—A. There is too much competition, and the places of the operatives would be filled up the next day; that is one reason why. It is just the same in regard to farming; the farmers do not strike because they cannot gain anything by it. I believe these strikes are fostered by the manufacturers sometimes in order to stop operations, so that the price of their goods may go up.

Mr. GEORGE W. ADAIR, of Atlanta, said:

I suppose the Commission desires to ascertain the views of the people in this section in regard to tariff subjects. From my association with them, I think I am safe in saying that the general sentiment here is that the tariff laws should be framed for the purpose of producing a revenue, and perhaps for giving incidental protection. I think that is the sentiment of the majority of our people. Georgia is the empire State of the South. She is more progressive and more alive to the varied interests of human life than any other State in the South. There is springing up in our midst quite a manufacturing industry in the matter of iron and cotton goods. I have noticed that whenever a man here engages in any manufacturing operations he immediately becomes a tariff man, because it is a matter of dollars and cents with him; and whenever a man starts a manufacture he wants protection, and he wants a heap of

it, and wants it quick. But when you look to the masses, the large portion of our agricultural people, I think you will find that they would favor only a tariff for revenue with incidental protection; whereas these iron and coal manufacturers want a tariff for protection chiefly. This tariff question has been lost sight of ever since the war began, because there have been other issues before the people which have overshadowed it.

By Commissioner BOTELER:

Question. You have used the term "incidental protection" as indicating the general sentiment of the people. By that you do not mean accidental protection, do you?—Answer. No law can be made so positive that it will fit every case. I mean that any just tariff that would provide for the revenues of the country, if it should at the same time protect some of the standard productions of the country, would not be objectionable, provided it was not done for the purpose of building up special interests.

By Commissioner UNDERWOOD:

Q. As you are very well acquainted with the resources of this State, I would be glad if you would give us your idea as to the nature and extent of the water-power in this section of the country which can be used for the running of machinery?—A. The water-power of the State of Georgia is as fine as in any State of the Union; it is almost unlimited. We have streams that are accessible by rail that furnish an abundant supply of water to run all the manufacturing establishments of the world. We have also a large coal and iron supply, and I believe the State has a very bright future before it in the way of increasing her manufactures. We have three cotton factories here, and soap, starch, and match factories, iron foundries, wagon and carriage factories, box factories, a watch factory, paper-bag factory, and a factory employing 300 women engaged in the manufacture of hats and bonnets.

Q. Are there not large deposits of marble in this State?—A. Yes, sir; and we have slate enough to supply the world, and marble enough for all the mantel pieces in it. We have also mica, iron, and copper. In the northern part of the State about Dahlonega the gold and silver mining industry is being conducted on a very large scale. There has been \$500,000 worth of machinery brought to Georgia and put into gold-mining operations since the war.

Q. The iron ore deposits are also very extensive, are they not?—A. Yes, sir; the supply of coal and iron is almost inexhaustible, and Georgia copper is known all over the world.

Q. Are you not also manufacturing sulphuric acid from pyrites obtained in Georgia?—A. Yes, sir; \$100,000 has been spent here since last January in developing that industry.

Mr. M. E. THORNTON, of Atlanta, said:

I am engaged in the publication of a newspaper in Atlanta. I want to speak to you as one living in the South who looks forward to a commercial future for the South. I am in favor of a protective tariff on all goods that can be manufactured in the South, as well as on iron and all articles entering into the consumption of our manufactures. At present most of the iron and coal is supplied by the State of Pennsylvania; but I claim that with the requisite capital and proper administration, we in the South have as fine a field for the development of the coal and iron industry as any Northern State. I think the South will eventually

demand a high protective tariff, because we have here all the natural resources and elements requisite to make us a great manufacturing people. The South at present is undeveloped. It requires capital, energy, and enterprise to develop its resources. We hope and believe that this Commission will be able to practically solve all these business problems for us, and, by recommending the imposition of a judicious tariff, bring relief to the whole Southern people. I desire to have the working people of the South protected in their labor, and that can only be done by the adoption of a judicious tariff. For myself, I am in favor of a high protective tariff system in all its essential features.

By Commissioner GARLAND:

Question. What proportion of the citizens of Georgia are with you in that belief?—Answer. I would not say that there was a majority; but I undertake to say that a large number of influential people here entertain similar views to my own.

By Commissioner BOTTLER:

Q. You are the editor of a newspaper here?—A. I am editor and proprietor of the Post-Appeal, an afternoon newspaper.

By Commissioner UNDERWOOD:

Q. Do you know of any other paper in the State which is advocating a high protective tariff?—A. Yes, sir; the Rome Tribune, a weekly newspaper, edited by T. Hanbury.

Q. Is the present tariff sufficiently protective to suit your views?—A. I do not think it is. In many particulars I think it should be a little higher, though in some respects I think it might be a little lower.

Q. On what articles do you think the duty should be increased?—A. I could not answer that question without going into specific details and statistics, which I have not had an opportunity of preparing.

Q. Do you claim that the sentiments which you express are those of a majority of the people of Georgia?—A. I would not undertake to say that; but there are large numbers of people in Georgia who entertain the same views that I do.

Q. Can you give us the names of any of them?—A. Mr. Thomas J. Hightower is one, and Mr. Norcross is another. Although I may not express the sentiments of the majority of the people, yet I would undertake to carry an election on a platform such as I have advocated.

Mr. J. H. Goss, of Decatur, Ga., farmer and physician, said:

As a member of the DeKalb Central Farmers' Club, I have been requested by some of the members to appear before this Commission to express some ideas in regard to our system of taxation and its bearing on our poorer classes of people. As an individual I am opposed to all indirect systems of taxation. Indirect taxation, I hold, works an injury to labor. Under our present tariff system I think labor is degraded by enticing it from its natural channel to follow unprofitable pursuits, and by inducing it to engage in business that it is not qualified to pursue. That diminishes the common production of the world.

The people of this section of the country—I mean the agriculturists—are, as a rule, poor people; the richest of them do not possess property valued at more than a few thousand dollars; and I think it is for the interest of this section of the country at least that all indirect taxation should be abolished. I think we should all be benefited here by a sys-

tem of direct taxation. I am opposed to the internal revenue system as well as to the system of collecting duties on imports. Of the two I would rather have a tariff. If we continue to have a tariff, I would say, "do away with all internal revenue taxes, and raise revenue from the tariff alone." Then we would have, perhaps, a tariff for revenue and not for protection. Then the masses might be benefited while at the same time the government would receive a sufficient revenue.

By Commissioner BOTELER:

Question. Your idea is that we should do away with all custom-houses, and have the revenues required by the government collected directly from the people?—Answer. Yes, sir; collected directly from the people on real estate.

Q. Your idea is that the tax gatherer should go around annually and call upon all the people, and they should pay directly from their pockets the hundreds of millions of dollars required to carry on the government?—A. Yes, sir; exactly. In doing that of course the rich man will have the most of these taxes to pay, and he is the man who has it in his power to see that the government is run economically, and to correct any abuses that may arise. My suggestion would be that the State and county officers should collect all the taxes for the general government, as well as those for the State and county. In that way we would get rid of custom-houses and internal revenue taxes, and of a vast horde of officials.

By Commissioner GARLAND:

Q. Are these the views of the club which you represent?—A. They are the views of a large number of the more intelligent farmers of Georgia.

Q. I understood that you appeared as the representative of a farmer's club?—A. No, sir. Our club has held no meetings lately; but I was requested to come before you by some individual members of it.

Has your club made any official expression of its opinion?—A. No, sir; it has not. I simply represent my own views as a farmer and a citizen.

Mr. WOODROW WILSON, of Atlanta, said:

It is not my purpose to represent or advocate any particular interest, but only to say a few words upon the general issues before you on the subject of protection or free trade. This question of the tariff is one which has been under consideration in Congress for 90 odd years. Early in the century protection was introduced for the purpose of fostering new manufactures in this country. That system was continued down to the time of the war; but since the war it has been upheld professedly for the purpose of raising revenue, and to enable the government to recover from the indebtedness caused by the war. Free trade, therefore, has been a slumbering question, but it will soon become one of the leading questions in all political discussions, because, now that peace has come, the people of the South will insist upon having the fruits of peace, and not being kept down under the burdens of war.

As you have already been told, there is a great deal of ignorance and indifference in regard to these questions in the South. The people here have been content to let things remain as they were. Probably this has resulted from the fact that the tariff is an indirect way of placing taxes upon the people, and they do not feel the immediate effects of it. But when the farmers and others begin to investigate these mat-

ters, they soon discover that they are, after all, paying these duties for the benefit of a few manufacturing classes. When a farmer discovers that he can buy a jack-knife of English manufacture for \$1.30, while he has to pay \$2 for a knife of American manufacture of the same quality, in order that the American manufacturer of cutlery may compete on equal terms with the British, then he feels that he has a personal interest in these subjects.

In thinking of this matter of indirect taxation, I am reminded of one of the few playful passages which illumine the utterances of Mr. Gladstone. In introducing his "budget" in 1861, he referred to direct and indirect taxation, and called them two sisters, the daughters of necessity and invention, one indeed more open and direct than the other, her sister more shy and insinuating; but he said that, as chancellor of the exchequer, he felt bound to pay his addresses to both. We have these two charming sisters in America, but they cannot be said to be the daughters of necessity and invention; they are rather the daughters of invention and monopoly. The necessities of our government are the necessities of the revenue; and it is well known that our government is not embarrassed from any necessities of revenue; on the contrary, it has an immense surplus. It is undoubtedly a part of true wisdom that the taxes laid by the general government should be indirect taxes. The province of direct taxation should be left to the States, and in order that the two systems may not clash and overburden the people, it is a part of wise policy that the national government shall make the most of its taxation indirect.

No man with his senses about him would recommend perfect freedom of trade in the sense that there should be no duties whatever laid on imports. The only thing that free traders contend for is, that there shall be only so much duty laid as will be necessary to defray the expenses of the government, reduce the public debt, and leave a small surplus for accumulation. But that surplus should be so small that it will not lead to jobbery and corruption of the worst sort.

We often hear the question asked by the advocates of protection whether it is a wise and consistent public policy for us to be dependent for supplies upon foreign governments. That was asked in reference to cotton-ties. It was said that the cotton-tie was manufactured almost wholly in England, and the question was put to the witness, "Is it a part of wise policy that we should be dependent on England for our cotton-ties?" In other words, we fear dependence on foreign manufacturers. Now, gentlemen, what does that mean? There is no danger in time of peace in being dependent on foreign manufacturers, because, if they raise their prices, the inevitable result will be that Americans will go into the manufacture and undersell them, and their prices must come down again. Therefore we are in no danger in time of peace. So that the argument of the protectionist must be a war argument. Of course, if a war should occur between this country and Great Britain, it would be greatly to the disadvantage of our southern cotton-balers to be dependent entirely on the English manufacturer for their cotton-ties. So that the protectionist advocates a system which prepares for war, while it has not any consideration for the requirements of the country in time of peace. I ask, is it worth while during fifty years of peace to provide by taxation for one year of war? Is it wise and just to tax the people for a contingency so that millions may be accumulated in the Treasury from the tax on these cotton-ties in order that war at some distant period, which no man sees, may be

provided for? War will cost a great deal when it comes; let it not be costing us in the mean time.

Another stronghold of the protectionists is the question of wages. They say, "How can we compete with the foreigners when the remuneration of labor is so much lower in foreign countries than in our own country?" Well, we can compete with them just as we do in regard to agricultural products. Of course every gentleman knows that our principal agricultural products have no duty imposed upon them. English wheat and other produce may come into our markets free of duty, and there is a freedom of trade in that regard, so far as the farmer is concerned.

By Commissioner GARLAND:

Question. Do I understand you to say that there is no duty on wheat?

—Answer. So I understand by looking at the last returns.

Commissioner GARLAND. Such is not my understanding.

Commissioner OLIVER. Wheat pays 20 cents a bushel, and the farmers have been asking us to keep that duty on, because they say otherwise it would be imported from Manitoba.

The WITNESS. Then I was misinformed. But it is a well-known fact that there is a greater disparity in the wages paid for agricultural labor in this country and in England than there is between wages paid in other industries, and although the duties on these agricultural products are lower, our competition with foreigners in this regard is more successful. In other words, we make up for the high price of our wages by the fertility of our land. There is no land in the world that can compare in fertility with the land of the West, and the consequence is, we have an immense advantage in that regard. We have advantages also in other industries, such as in mining and in cotton productions. These are compensations which are provided, and which no human laws can take away.

There are positive grounds, however, upon which protection can be objected to. It is understood that the protective tariff policy was adopted in this country in the beginning on the idea advocated by John Stuart Mill and one or two other eminent writers on the subject in England, who said that a new country might with advantage protect its infant industries, provided the tariff which was laid for that purpose was merely a temporary expedient for building up those industries. It was upon that idea that America first established this protective system. What has been the result? These infant industries at first were protected by very small duties, but, instead of growing into manhood and strength, they have gone into weaker decrepitude. They have needed more and more protection as years have gone on, until the climax has been reached at the present time. That ought to overthrow the whole doctrine in itself. But the danger in imposing protective duties is, that when the policy is once embarked upon, it cannot be easily receded from. Protection is nothing more than a bounty, and when we offer bounties to manufacturers they will enter into industries and build up interests, and when at a later day we seek to overthrow this protective tariff, we must hurt somebody, and of course there is objection. They will say, "Thousands of men will be thrown out of employment, and hundreds of people will lose their capital." This seems very plausible; but I maintain that manufacturers are made better manufacturers whenever they are thrown upon their own resources and left to the natural competition of trade rather than when they are told, "You shall be held in the lap of the government, and you need not stand upon your feet".

Such theories discourage skill, because it puts all industries upon an artificial basis. The basis that they rest upon is not that of the skill of the manufacturer; it is because the bounty of the government is put on his trade which enables him to get more for an inferior article than a foreigner could get for a better article.

Protection also hinders commerce immensely. The English people do not send as many goods to this country as they would if the duties were not so much, and in that way there is a restriction of commerce, and we are building up manufactories here at the expense of commerce. We are holding ourselves aloof from foreign countries in effect, and saying, "We are sufficient to ourselves; we wish to trade, not with England, but with each other." I maintain that it is not only a pernicious system, but a corrupt system.

By Commissioner GARLAND:

Q. Are you advocating the repeal of all tariff laws?—A. Of all protective tariff laws; of establishing a tariff for revenue merely. It seems to me very absurd to maintain that we shall have free trade between different portions of this country, and at the same time shut ourselves out from free communication with other producing countries of the world. If it is necessary to impose restrictive duties on goods brought from abroad, it would seem to me, as a matter of logic, necessary to impose similar restrictions on goods taken from one State of this Union to another. That follows as a necessary consequence; there is no escape from it.

H. Mis. 6—82

A. G. WEST.

ATLANTA, GA., *September 23, 1882.*

Capt. A. G. WEST, of Cedartown, Ga., manager of the Cherokee Iron Works, addressed the Commission as follows:

About fourteen years ago I came down into this country and engaged in the manufacture of pig iron, first in Alabama and subsequently in Polk County, Georgia. I will state a few facts in regard to the iron business in this section of the country. I located in Polk County ten years ago and employ about 350 hands making charcoal pig iron. I have made some calculations about the relative cost of the raw material and the labor, and I find that I can put pig iron on the cars at \$15 a ton, expenses all paid; and out of that \$14 is the cost of labor, leaving only \$1 for the raw material, which we have in great abundance in this country. So far as the present tariff is concerned, I am satisfied with it as it is; it would do me very well. There are others, not as well located as I am, who would like a higher tariff. The laborers I employ average, right through, \$1.25 a day wages. If I could get them to work for 40 to 60 cents a day, as is done in Europe, I should not want any tariff.

The margin of profit on pig iron is not excessive. It pays a good interest on the money invested. We have \$5,000,000 invested in Polk County, and we have succeeded in making a fair rate of interest on that sum; but that is about all. If the tariff was taken off, and we had to compete with English iron laid down in New York at \$14 a ton, we should have to abandon the business—we could not compete at that figure. Neither could we compete with Charleston and Savannah under those conditions; we should soon have to stop our furnaces.

By Commissioner UNDERWOOD:

Question. How many tons of pig iron do you make a day at your establishment?—Answer. We average about 28 tons a day.

Q. How far is it located from Rome, Ga.?—A. About 20 miles.

Q. And how far from the Tecumseh Iron Works?—A. About 12 miles.

Q. How far from the Ettna Iron Works?—A. About 7 miles.

Q. I would be glad to have you state whether or not in your section of the country, and from 50 to 100 miles around, there are not good iron ores?—A. Yes, sir; plenty of them.

Q. What kind of ores are they?—A. Brown hematite.

Q. Where do the red fossiliferous ores come from?—A. Those are 40 or 50 miles from our place in the region of Birmingham and Round Mountain, and all through that section over the Coosa River.

Q. Are you acquainted with Taylor's Ridge?—A. Yes, sir.

Q. How are the ores there?—A. There is enough iron ore there to keep all the furnaces going for many hundred years, I think. There is no lack of good ores in this country.

Q. Are there not fine forests also for making charcoal?—A. Yes, sir. Fine forests, and coal mines which will be developed.

Q. How far is it from your furnace to the ore fields?—A. About 50 miles. We are now making a survey for a railroad which will bring us within 12 miles.

Q. At what rate can ore and coal be laid down at your place?—A. The run of the mine for about \$2, and for good coal \$2.50. There is no end to the ores up in that part of the country.

Q. Is there any part of Pennsylvania where the iron ores are superior to those found there?—A. If there is I don't know it.

By Commissioner OLIVER:

Q. Are they better than the Cornwall?—A. I have an iron better than the Cornwall. I have 400 acres in ore, and I have only exhausted one acre during the last ten years. I know there are fine ores in Pennsylvania, but it costs more to get at them.

Q. You have been making charcoal pig iron at \$15 a ton?—A. Yes, sir.

Q. What do the makers of coke iron say the cost is per ton?—A. I do not know that. I suppose they make a coke iron for \$10 or \$12 where they are well located. When I get my railroad built through, I hope to do a little in that line.

Commissioner OLIVER. That is cheaper for both charcoal and coke iron by from 30 to 50 per cent. than any place I know of to-day where pig iron is made in any quantity in the United States.

The WITNESS. The trouble is, we have to ship everything away, and the freights neutralize the cheapness of the iron.

By Commissioner UNDERWOOD:

Q. Are you acquainted with Noble and Tyler's works at Anniston?—A. Yes, sir; they have very fine works there, and are making about 60 tons of iron a day. They have a large cotton factory there, also, in a town of about 1,500 inhabitants, with churches and schools. Cedartown had about 250 inhabitants when our establishment was first located there, and they are now claiming a population of 2,000. The starting of the iron works up there has developed that portion of the country.

Q. How many bales of cotton are sold at Cedartown annually at present?—A. About 12,000 last year, I think, and they hope to increase the production. I think that as soon as the railroad is through, we will get 30,000 to 40,000 bales of cotton at Cedartown.

Q. Have you any slate quarries in Polk County?—A. Yes, sir; we have plenty of them, and of a good quality.

Q. Is not the supply inexhaustible there?—A. I suppose so. I cut through a slate bank in extending the railroad which is 20 feet deep, and the slate is as fine as any I ever saw in Pennsylvania.

Q. Is it not also a fine agricultural country?—A. Yes, sir; they raise as much there as anywhere I know of.

Q. Do your works furnish a home market for agricultural products?—A. Yes, sir; and we are even troubled to get enough at the works. I have had to buy lots of corn, wheat, and hay, and such things. I raise a good deal on my own plantation, but I cannot raise enough to support the works.

Q. Do you not consume all the perishable products around there?—A. Yes, sir. There is a market at the works for all the butter, eggs, chickens, &c., that can be had. Our supply comes from a section of country extending 15 or 20 miles around there. We consume all that the farmers raise; in fact, we have difficulty in getting all we want; articles are sometimes pretty scarce.

Q. Since the location of your works there, has not the country been more prosperous than before?—A. Yes, sir; land within 4 or 5 miles of the works is worth 25 per cent. more than other land around there. Land

is worth \$100 an acre now where it was formerly worth only \$25 an acre. There is also fine water-power there.

Q. Do you know anything about the Tallapoosa River?—A. Yes, sir; there is a great abundance of water there.

Q. Do you know anything about the Coosa River?—A. Yes, sir; on the Coosa River, until you get to the ten islands, there is not much power; but then there is as much as there is at Lowell. At Wetumpka Falls there is an immense volume of water. The river is navigable to Greensborough, though at both ends it is shallow. The government is expending money there very judiciously in improving it. There is going to be a large production of coal in that region, and we must have cheap transportation for it.

By the PRESIDENT:

Q. What does your charcoal cost you?—A. Six cents a bushel. I have 20,000 acres located along our line of road, and I suppose it will last me for many years. We are shipping about 30 car-loads of lumber a day regularly. It is yellow pine entirely. We cut it into saw-logs and make it into lumber, and take the refuse and make it into charcoal.

By Commissioner OLIVER:

Q. Do you burn yellow pine to make charcoal?—A. Yes, sir; and it makes the finest charcoal in the world.

Q. Do you grow the land again?—A. Yes, sir. It grows up in oak the next time. I have some land that was cut off 9 years ago, and the young trees are now as high as the ceiling of this room.

By Commissioner BOTELER:

Q. Have you any chestnut oak there suitable for tanning purposes?—A. Yes, sir; lots of it.

By the PRESIDENT:

Q. Don't you use the oak for charcoal?—A. We cannot at present. In ten or fifteen years more it will make very good wood.

By Commissioner GARLAND:

Q. What recommendation do you make with regard to the present duty on pig iron?—A. I think the tariff is about right where it is. It gives a fair margin of profit to the manufacturer, and is not excessive at all. Pig iron is now selling at from \$16 to \$20 a ton at the furnace. It costs \$15 to make it, and you can see that there is not a very large margin. I do not think there is any danger of our becoming suddenly rich, but it is a fair business, and we are entirely satisfied with it. There are other works, not quite so well located, where it costs them more. Still, if you should take off the duty of \$7 a ton, the price of labor has got to go down or the furnaces must stop, because we do not make half of that sum profit. No man will run a furnace unless he makes a profit out of it, of course.

By the PRESIDENT:

Q. Is the capital employed in your establishment furnished at the South?—A. No, sir; it is from New York. My brother-in-law and myself constitute the company. We have in addition to our works a railroad 38 miles long, and we are about to build 100 miles of road to Birmingham.

RICHARD PETERS.

ATLANTA, GA., *September 23, 1882.*

Col. RICHARD PETERS, of Atlanta, Ga., addressed the Commission as follows :

I desire to call the attention of the Commission to a plant that is known in America as the ramie plant. I have brought some samples of it here with me to show you. The roots of this plant I received from the Agricultural Department in the year 1868, and I have raised quite a quantity of it. The Chinese obtain the fiber by scraping it off with a knife. It can only be made valuable in commerce in this country by the invention of some machine to do that work; a machine similar to that necessary for the manipulation of hemp and flax. I understand there have been several machines invented for this purpose, and I received the other day from St. Louis this sample of the crude fiber just as it is stripped from the stalk. [Exhibiting.] I sent that to New York, and it was put through a process there, which they say is very simple and inexpensive, and as a result, this beautiful fiber was returned to me [exhibiting], showing great strength, and fineness, and length. It is said that it can be manufactured at a very cheap rate. The climate of Georgia is admirably adapted to the growth of this plant. It is a perennial, and when once planted, with a little top dressing of manure, two or three crops can be made in the course of a year. It can be produced almost anywhere in the southern portion of the United States, although the climate is too cold in New England to cultivate it successfully there. If the necessary machinery is invented to manipulate it, I think a crop of this fiber can be produced cheaper than flax or hemp. In commerce it is known as *cosmos*.

I have myself only an acre of this in cultivation. It was first introduced into this country about 1868, but there does not seem to have been any special attention paid to its culture. I think the reason is that we have been waiting for a machine which can prepare it. The British Government has offered \$20,000 premium for a machine to prepare it, and they claim that one has been invented which will take off the fiber.

By Commissioner GARLAND :

Question. Can it be handled by the same machine which handles jute, flax, and hemp?—Answer. Yes, sir; it is taken off in the same way. It grows 5 or 6 feet high, and can be cut twice or three times in a year.

I also desire to call the attention of the Commission to another article I have here, made of Angora or mohair wool. Angora goats were introduced in 1848 in South Carolina, and in 1856 I brought some to Georgia, and from this point they have been distributed throughout the United States. I claim this as a Georgia production. This article has been brought into notice within the last year or two by the manufacturers of New England, who have spent two or three hundred thousand dollars in developing the manufacture, and they are calling now for millions of pounds of the mohair. I have here [exhibiting] a robe made from Georgia mohair by the Tingle Manufacturing Company, of

Connecticut. It makes a robe which keeps out moisture and rain better than anything I have ever seen.

I have also here a specimen of plush [exhibiting], which came from the same manufacturer. It is used for covering the seats in railroad cars. There is a great demand for it. These manufacturers are now calling upon the sheep raisers of Texas and the Western States, to raise more mohair so as to develop this new industry.

By the PRESIDENT :

Q. What is the quality of the American mohair compared with the European mohair?—A. It is found to be superior; but they pay more for it.

Q. Do you regard it as important that there should be a protective duty on wool or mohair?—A. Yes, sir; at present it cannot stand alone; but, like other matters only partially developed, requires some protection. The animals have to be brought from Asia, and that costs large sums, and for some years the culture requires protection. We ask for nothing more than the present protection however. We do not desire any change.

By Commissioner OLIVER :

Q. In regard to the ramie plant, you suggest that it be protected in connection with flax and hemp products, and jute?—A. Yes, sir. A few years ago it was a matter of no moment, because we were waiting for the invention of a machine to handle it. But I understand that a machine has been invented, and now I think for a few years we should have protection.

Q. Can this article be manufactured cheaply?—A. Yes, sir; it can be when the machine is perfected, and after it is developed, then it can sustain itself without protection. For the last 8 or 10 years the wheat and grain of the Northwest has been bundled together with wire, but they have found the use of that objectionable, and now they are using rope for binding purposes. This ramie is very well adapted for that purpose.

Q. Can it be grown cheaper than hemp?—A. Yes, sir; it can be in the southern country. The roots will not stand a northern frost; it would kill them. This is a perennial and stands all winter, whereas hemp is an annual, and must be sown every year. This ramie will grow for many years with only the necessary top dressing of manure, and you can gather two or three crops a year from it. I think it could be grown and manufactured very cheaply indeed.

By Commissioner BOTELER :

Q. Which is the hardier plant, the ramie or jute?—A. There is no comparison. The jute is an annual, and will not mature its seeds here. The seeds will have to be brought from India every year. That is the great difficulty about jute. In the southern part of South Carolina jute may be planted, and some seasons you could raise seed, but it is not certain. It is an annual and liable to be killed by frost.

Q. Neither of these plants can be grown to advantage in Virginia?—A. Yes, sir; this ramie could be grown in Virginia; but you could not grow jute there; the season is not long enough.

By the PRESIDENT ?

Q. Is this the fiber that was formerly known as China grass?—A. No, sir; it belongs to the same family, but it is a much finer plant. China grass is coarser, and grows wild. This is a cultivated plant in China, and is called cosmos in trade.

By Commissioner UNDERWOOD :

Q. Could not jute be raised on the lower delta of the Mississippi River, and in the south of Florida; would it not seed there?—A. Yes, sir; it would, but it would not as far north as here. I have planted jute here, but have never been able to mature the seed so far north.

By Commissioner GARLAND :

Q. Do you ask for any change in the duty on these fibers?—A. No, sir; no change at all.

Q. This article would come in at \$15 a ton, the same as jute?—A. I am not familiar with the duty, but I do not think it would require any higher duty than at present. We are well satisfied with the present protection.

A. B. ROSE.

CHARLESTON, S. C., *September 26, 1882.*

Mr. A. B. ROSE, of Charleston, addressed the Commission as follows:

I am president of our local agricultural society, and desire to say a few words in regard to agriculture. The agricultural resources of our section of the country comprise not only rice culture, but also the very important culture of sea-island cotton. I do not know that we are in any way affected by the duties upon our produce, except in the matter of the duty upon machinery used for agricultural purposes, and the duty upon cotton ties, which the planters would be very glad to be relieved from, and it would certainly be an assistance to them. If we could be relieved of the duties upon all agricultural machinery the planter would be able to obtain it at a very much less cost than at the present time. In the cultivation of rice, pumping machinery is coming very much into use and becoming very necessary. A large proportion of the land in our State is low, and in order to avail ourselves of the use of these lands for rice culture and other purposes, it is necessary to have pumping machinery. A large part of the rice-growing land has been abandoned for the reason that parties have not been able to cultivate rice profitably. If machinery could be obtained cheaply, it could be used in bringing these lands back into cultivation.

By Commissioner BOTELER:

Question. You think that it would be an advantage to get machinery from abroad rather than to get it in this country?—Answer. Only because we would get it cheaper. I had occasion a short time ago to purchase a small narrow-gauge locomotive, and I found I could buy it abroad for one-half of what I was obliged to pay for it in this country; but I discovered that the duties upon it amounted to about 50 per cent. So I could not gain anything by importing it.

By Commissioner OLIVER:

Q. Suppose the manufacturers who make locomotives in this country should say that, if their operatives could buy the rice which they consume, at one-half the price they have to pay on account of the duty levied upon it to protect that industry, they could reduce proportionately the price of their engines?—A. Well, no doubt they would say truly. I suppose what we want is a duty on rice, no duty on machinery, and a duty on foreign fertilizers.

JOHN SCREVEN.

SAVANNAH, GA., *September 25, 1862.*

Col. JOHN SCREVEN, of Savannah, Ga., addressed the Commission as follows:

I desire to call attention to a report which has been prepared by a committee, specially appointed for the purpose, upon the condition and needs of the American rice industry, particularly with reference to the duty imposed on foreign rice. This report is as nearly complete as it is possible to make it. There has been some information obtained since it was prepared in reference to the importation of foreign rice into this country, to which I will take occasion to advert hereafter. The delegation of gentlemen who are present here consists of merchants and planters appointed for the purpose of approaching the Commission on this subject. They represent a very large and important interest, covering not only this State and the adjoining State of South Carolina, but the whole country along this coast down to the Florida line, say 100 miles, on the coast of Georgia and South Carolina. That district produces probably, in proportion to its area, as much rice as any part of the United States. There is also a considerable amount of what is called inland rice grown in the interior. We represent here probably 40,000 to 45,000 persons engaged in the cultivation of rice, and probably 30,000 to 40,000 acres of land devoted to that product. This would involve, as you will perceive, a very large production, and we are very greatly interested in taking care of these interests.

I make this preliminary statement so that you will understand that we do not approach you with any slight interest behind us at all. The rice production of the State of Georgia comprises about one-half of the production of the Atlantic coast, and about one-third of the production of the whole United States.

The special committee appointed to investigate the condition of American rice industry, and to ascertain in what manner and degree it is affected by the import duty on foreign rice, beg leave to report as follows:

There are three distinctive periods in the history of the rice industry in the United States: First, from its introduction into Virginia and South Carolina, in the seventeenth century, down to 1861; second, from 1861 to 1866, both inclusive; third, from 1866 to July, 1881.

Anterior to 1720, there are no data to be found as to the amount of the production of this grain, but the export of rice from South Carolina from 1720 to 1729, inclusive, was 264,788 barrels of 325 pounds each, or 86,056,100 pounds. This would be equivalent to an average annual export, for the period embracing nine years, of 9,795,777 pounds. McCullough's Dictionary of Commerce and Navigation states the production of rice in America in 1724 at 18,000 tierces, or 10,800,000 pounds, an amount so near the average annual exportation of the nine years just mentioned, which include 1724, that it is probable production is in this instance confounded with exportation.

In 1728 and 1729 the export of rice from the port of Charleston was 32,384 barrels of 400 pounds each, or 13,147,600 pounds; and in the period from November 1, 1770, to October 10, 1771, 130,500 barrels, or

52,200,000 pounds. Of the latter, showing the direction of exportation, 103,630 barrels were shipped to Great Britain and the British West India Islands. The remainder was exported to Portugal, Spain, Italy, and to ports on this continent. From November 1, 1772, to August 2, 1773, there were exported from Charleston 112,649 barrels, and from all South Carolina ports, of the crop of 1773, 125,076 barrels.

It appears that in 1770 there were exported "from the colonies" 150,529 barrels, or 60,211,600 pounds, showing that about 20,000 barrels, or 8,000,000 pounds, were exported from other than South Carolina ports. It is probable that the colony of Georgia, then in vigorous growth, chiefly assisted the increase of production.

From the year 1773 down to 1791, a period mainly covered by the revolutionary war, there are no statistics of production or of exportation, but in the latter year there were exported from the United States 96,980 tierces of 600 pounds each, or 58,368,000 pounds. The following year, 1792, the export sprung up to 141,762 tierces, or 85,057,200 pounds.

The following table shows the export of rice from the United States, beginning with 1791, and continued by decades to 1830, inclusive:

Years.	Tierces.	Pounds.
1791.....	96,980	58,368,000
1800.....	112,656	67,593,600
1810.....	131,341	78,804,600
1820.....	71,663	42,997,800
1830.....	130,097	78,418,200

Beginning with 1840, the statistics, until then wanting in positive data as to production, become more instructive as they become more complete. The following table exhibits the production, export, and home consumption in the decades stated:

Years.	Production.	Exports.	Home consumption.
	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>
1840.....	80,841,422	60,000,000	19,841,422
1850.....	215,313,097	68,000,000	147,313,097
1860.....	187,187,032	75,373,000	111,794,032

In the first of these years the export was 75 per cent.; in the second, 31 per cent.; in the third, 40 per cent. of the production. With the year 1860 ended the first period of the American rice industry, which was distinctive, in the absence of the importation of foreign rice, in maximum home production, in low prices, and in exportation, which controlled the markets of foreign countries, and made them large contributors to American prosperity and wealth.

The second period began in 1861 and ended in 1866, with characteristics the reverse of those which distinguished the first period. In 1860 there was no import of foreign rice, and the export of domestic rice reached to 75,373,000 pounds; but in 1861, the first year of the Confederate war, there were imported 148,550 pounds, and there were exported only 39,683,000 pounds. The blockade of the Southern ports was begun in the spring of 1861, and from this time the government record of domestic rice could have been partial only, and therefore affords no criterion of the amount of production or of the capacity of the country

to export for that year. But the following year, 1862, the statistics are decisive. Domestic production and consumption of the domestic product were both exclusively confined to the Southern States, and the government statistics show that in 1862 there were imported 56,961,317 pounds of foreign rice, and that there were exported only 3,552,000 pounds, the latter being doubtless foreign rice reshipped for lack of a market.

The following table will show the status of American production and commerce in rice for the second period:

Year.	Production.	Import.	Export.
	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>
1860-'61		148,550	39,683,000
1861-'62		56,961,317	3,552,000
1862-'63		61,193,700	1,300,000
1863-'64		99,691,447	1,632,000
1864-'65	11,592,000	44,581,519	718,500
1865-'66	12,206,720	75,514,064	703,711

The crops of 1861, 1862, and 1863 were wholly lost to the Union. Hence, the consumption in the Northern and Western States was limited to foreign rice, and exportation for these years from American ports was exclusively of foreign rice laid down in bond. Despite the crop of 1865-'66, 12,206,720 pounds, the importation of foreign rice in 1866 reached 75,514,064 pounds, or about 10,000,000 pounds more than the average annual importation of the four previous years.

This, the second period of the American rice industry, is distinctive as the period of maximum prices, in which importation took the place of domestic production, and foreign rice practically monopolized the American market.

The prices of rice in the New York market were as follows in the months of January and July of this period:

	1861.	1862.	1863.	1864.	1865.	1866.

The prices from 1862 onward were war prices, peculiarly the result of armed conflict between interdependent sections of the same country, one of which no longer supplied the other with a domestic, now supplanted by a foreign product, commanding prices limited only by the necessities of the consumers and their ability to purchase. Under the condition of war, rice becomes very largely an article of hospital consumption. Hence, in the years when the armies of the United States were most numerous and most active, the consumption of rice was the largest. In 1863 the consumption was 60,836,790 pounds. In 1864 it reached

98,059,447 pounds, or only 3,735,585 pounds less than the whole consumption of the United States in 1860, when they were at peace.

The third distinctive period of the American rice industry commenced in 1866, and terminated in 1881. The following table epitomizes the history of the domestic production, foreign importation, and consumption of rice in the United States in this period:

Table showing domestic production, importation, exportation, and consumption of rice.

Years.	Domestic production.	Domestic rice exported.	Domestic rice consumed.	Foreign rice imported.	Foreign rice exported.	Foreign rice consumed.	Total consumption.
	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>

1876-'77	81,391,800	430,991	80,951,809	71,501,852	10,610,614	54,951,238	135,003,047
1877-'78	77,240,400	1,306,982	75,933,418	64,013,004	14,483,645	40,529,410	125,462,837
1878-'79	84,730,200	631,165	84,108,005	47,489,878	9,656,593	37,833,285	121,941,380
1879-'80	80,096,800	178,534	86,818,266	57,364,848	8,793,395	48,571,453	135,389,719
1880-'81	117,766,000	159,451	117,615,549	68,739,409	10,819,807	57,919,542	175,535,691

In the first year of the third period the domestic production was 11,592,600 pounds, and the foreign rice imported 60,407,756 pounds. As early as the fifth year the domestic production had swelled to 53,937,000 pounds, showing an increase of nearly 365 per cent., indeed overlapping the foreign importation; but still the gross importation (292,909,944 pounds) in the first five years exceeded the gross domestic production (119,129,120 pounds) 183,780,824 pounds.

It is remarkable that in these first five years the total exportation of domestic rice was greater by nearly 40 per cent. than in the eleven years subsequent.

In the latter period, that is, from 1870-'71 to 1880-'81, both inclusive, the domestic production sprung from 47,348,000 pounds to 117,766,000 pounds, with an annual average of 71,931,379 pounds—while the average annual consumption of the domestic product was 71,312,953 pounds—the average foreign importation being 64,365,375 pounds, and the average consumption of foreign rice 50,143,756 pounds, or about the same for annual consumption of the latter as in the half decade from 1865-'66 to 1869-'70.

The total average annual consumption of rice in the United States for this half decade was 72,075,489 pounds, and for the subsequent eleven years, to 1880-'81, 121,455,856 pounds. The consumption, however, in 1880-'81 was 175,535,091 pounds.

These data prove conclusively that the average amount of foreign rice consumed in the United States during the past sixteen years is not materially changed; that the total average annual consumption of both foreign and domestic rice has sprung from 72,075,489 pounds in 1869-'70, to 121,455,856 pounds, and that while the importation and consumption of foreign rice has not materially diminished, the production of domestic rice has increased, so as to meet the increase in domestic consumption, while an average surplus of 14,221,618 pounds of foreign rice is an-

nually bonded in the American custom-houses, holding in check the price of American rice.

This surplus is nearly equal to the whole production of the United States in 1867-'68, and exercises a decided repression on the price of rice in the American markets. Its influence would be more potential were foreign equal in quality to American rice, and did not the marked increase in domestic production strengthen the competitive forces in the American markets.

These competitive forces are two-fold: first, between domestic production and foreign importation; second, between the domestic producers themselves.

The effects of this competition would be more decided but for the increase of population, and consequent increase of consumption.

In 1869-'70 the consumption was 95,900,697 pounds, or $2\frac{1}{2}$ pounds per head; in 1880-'81, 175,500,000 pounds, or $3\frac{1}{2}$ pounds per head. This remarkable increase in consumption is in great measure due to the large Chinese immigration into the Pacific States, and to the introduction of rice into new objects of industry. It is into these States that the great bulk of foreign rice is imported, amounting for the year terminating in June, 1879, to over 80 per cent. of the gross foreign importation. Of this nearly 72 per cent. came from China and Hong-Kong, 7 per cent., duty free, from the Hawaiian Islands, and 17 per cent. from England, cent. from England, the latter the production of East Indian labor.

Holding in view these prominent facts, it may be now considered whether the protection given to the domestic rice industry by the present import duty may be justly maintained.

It has been seen that the domestic production increased 130 per cent. in twenty years, from 1840 to 1860. During this period the duty on foreign rice was 20 per cent. ad valorem. In all the rice-producing division of the country slave labor was then employed, and no foreign rice was imported. Quite contrary to present experience, when so little domestic rice is exported as to be inappreciable in the marketing of the crops, more than 147,000,000 pounds were exported in 1850, and 112,000,000 pounds in 1860. In the former year the average price of rice in the New York market was \$3.18 $\frac{1}{2}$, and in the latter year \$4.20 per 100 pounds. The average price of the whole period from 1850 to 1860 was materially increased by the great storm of 1854, which swept away the greater part of the crop of that year, and by the draught made on the labor of the South Atlantic States by emigration to the West and Southwest. But it may be stated, as an evidence of the cheapness of production not long anterior to this period, that in January, 1843, prime rice sold in the Savannah market for \$1.50 to \$1.75 per 100 pounds.

These minimum prices represented about one-third more than the sheer cost of production with slave labor before the late war between the States. The per diem of slave labor did not much, if at all, exceed twenty cents, and on this basis the cost of cultivating rice was about \$1.10 per 100 pounds.

Comparing these data, ascertained as nearly as possible for the same period and for the same industry in China, now the great competitor with the American producer, it is found that in 1847 the wages of a Chinese field laborer were about fourteen cents a day. He could live for about \$2 to \$2.50 per month, including clothes and rent, or from 7.6 to 9.3 cents per diem for twenty-six working days. We learn from the same authority that rice was worth about nine mills per pound, or ninety cents per 100 pounds.

In view of these facts alone, it is evident that if American rice was

produced at \$1.10 per 100 pounds, Chinese rice could not have been profitably brought into the United States, even if relieved of the then subsisting import tax of 20 per cent. ad valorem.

The result was a monopoly to the American producer, not only in the home markets, but practically in the European and West India markets, where the American staple predominated. This commanding position gave the American producer greater and more assured profit than is now possible with free labor, even with the advantage of a heavier import duty on foreign rice.

In the period between 1840 and 1860, the duty on foreign rice was absolutely needless as a protection to the American producer, and valueless as a source of revenue to the government. The former was wholly independent of protection to an industry maintained by labor, in cheapness second to that of Asia only, and in effectiveness unsurpassed. He was in a position to defy competition, and triumphantly met the almost free importation of East India rice, even in the English markets. He pointed to his fields as unexcelled examples of industry, skill, and profit. Holding the same rank with the American cotton producer, and moving *pari passu* with him in the commerce of the civilized world, protection was as unnecessary to him as it was useless to the government. To have called the duty protection would have been absurd; it was, in fact, merely supererogatory.

But, in 1862, the importation of foreign rice was 56,961,317 pounds. Except for the internal supply of the Southern States, the cultivation of rice was then rapidly diminishing. The rice fields, which lay chiefly in the great tidal deltas, the first to be reached in the military operations against the South, were soon laid waste or abandoned. The planters retreated with their slaves into the interior. The result was that in 1865 the crop had dwindled from 187,000,000 pounds in 1860, with an exportation of 75,000,000 pounds, to 12,000,000 pounds production, with an importation of 45,000,000 pounds! Indeed, the importation for 1864 was nearly 100,000,000 pounds, and the production *naught!* In short, Asiatic rice had taken entire possession of the American markets, except within the Confederate military lines, and at this time, despite the immense volume of importation, the prices in the New York market ranged as high as from \$12 to \$14.50, and in some exceptional instances to \$17 per 100 pounds.

The duty on cleaned rice had been raised in 1862 to 1½ cents per pound. In 1864 it was again increased to 2½ cents per pound, and so remains unchanged.

This duty was imposed in time of war, but why may it not be continued in time of peace? In time of war it was contributory to the cost of the war, but it was also a tax on a foreign monopoly. In time of peace it remains a tax on a foreign imported commodity, undiminished in volume and contributory to the maintenance of the government in undiminished amount, while it is a necessary prevention against the re-establishment of a foreign monopoly, and a protection alike to the American producer and consumer.

The conditions surrounding the American producer have changed wholly since the imposition of the present duty on foreign rice. In 1865 the American rice crop was, say, 12,000,000 pounds, about equal to the crops in the early history of the culture, say from 1725 to 1730. The industry had been remanded to its infancy. The planters had returned to their estates, to find buildings, machinery, and implements destroyed; the appliances of a wonderful system of irrigation and drainage mutilated or wrecked; the long-abandoned fields grown up in tangled wilds

of brush, vines and trees; the once disciplined and supremely efficient labor of the country turned into a mob, stolid when not outrageous, but rapt in the delusion of race supremacy, and credulous that emancipation meant unbridled license or easy indolence.

It should be no marvel that the great majority of the planters recoiled from an industry which seemed only a desperate adventure. A few who undertook the work of recuperation succeeded at the risk of the little capital or credit left to them, and often at the peril of life itself. Many failed; none so wretchedly as those who were unfamiliar with a culture demanding peculiar experience and skill, or who were unable to adapt themselves successfully to the new régime of labor and to the unexpected character of employées who had yet to learn the severe lesson of quickly earned and untried liberty.

In short, relegated to its earliest historical conditions, the rice industry of the South was practically commenced anew, and if it had any encouragement at all, it was in the protection afforded by the import tax on foreign rice. This was equivalent to giving the home producer a start of, say, 80 per cent. ad valorem in the home markets against the foreign grain delivered duty paid. But even with this advantage, while the prices glittered, they were not necessarily profitable. The crops were cultivated for many years at extraordinary cost and at great hazard. These embarrassments were diminished in process of time, and meanwhile, as labor became more efficient and less costly, and the consumption of rice increased, so the area of cultivation and the production expanded. But at no time since 1865 could rice have been cultivated, as a staple product, without the protection afforded by the import duty on the foreign grain.

Since the emancipation of the slaves, the cost of agricultural labor in the South has increased more than 100 per cent. In the rice districts of the Carolinas and Georgia, females obtain from 50 to 75 cents, males from 60 cents to \$1.25 per diem—this without the efficiency to be expected from free labor. The laborers frequently refuse to undertake tasks, easy under a sterner system, and essential to rice cultivation. A day's labor is commonly reduced to six hours instead of ten. For such reasons, great waste attends the harvests, which from the peculiar conditions required in curing this grain, do not as yet, despite the efforts of invention, admit the horse reaper, and are still conducted with the sickle. The consequences of these embarrassments are reduced production, and, commonly, minimum crops. Added to these are the disastrous storms which sweep over the tidal deltas, on which the most extensive and most productive plantations are found. As an example of the destructiveness of these great convulsions, the storm of the 27th of August, 1881, laid waste from 40 to 50 per cent. of the rice crop on the coasts of South Carolina and Georgia, besides mutilating the plantations and destroying buildings, implements, live stock, and many lives. In some instances, indeed, the crops were annihilated, and the planters were compelled to abandon their property. Storms of such extreme destructiveness seldom happen more than once in a generation, but their ravages are appalling, and their effects upon the property and fortunes of the sufferers, if not absolutely ruinous, may be protracted through many years. Storms of less violence occur, however, at much nearer intervals, and despite protectives against them, erected at extraordinary outlay, they sometimes inflict losses sufficient to cancel more than the profits of a crop.

But without taking into consideration hazards, which in this culture demand extraordinary precautions, it is evident that the price of labor

alone renders it at this stage of the industry impossible for rice to be cultivated at its low cost in the slave period, while the cost of competing Asiatic labor is not materially changed. Hence Asiatic rice may be delivered at American ports for \$2.90 per hundred pounds average value, while it is conceded that the average crops on the Carolina and Georgia coasts do not exceed thirty bushels per acre, and cost, including interest on land and annual outlay, about \$35 per acre. The cost, therefore, of making the crop would be about \$4.33 per hundred pounds, thus conceding to Asiatic rice an advantage equivalent to \$1.43 per hundred pounds. After payment of the import duty, Asiatic rice should be worth, say, \$5.40 per hundred pounds, and if the American producer is allowed the difference of cost between his and the Asiatic grain, say \$1.07 per hundred pounds, his profit would be small, especially if the extraordinary and peculiar hazards of his industry are included in the estimate.

The American producer, therefore, is dependent, under present conditions, on the protection of the import duty. With that advantage even the prices he obtains are governed by the state of the markets and the quality of his grain, and his profits may proceed wholly from his ability to exceed the average yield or to reduce the average cost of the crops. Such profits may fall to those only who are favored with lands easily cultivated and of extraordinary fertility.

If the effect of the import duty on the rice market be now considered, it will be found that the average price of good American rice in 1880-'81 did not exceed \$5.50 per hundred pounds, showing that domestic and foreign rice were nearly equal in price, and were brought into contact under the most absolute condition of competition. In round numbers, 118,000,000 pounds of American, and 69,000,000 pounds of Asiatic rice were offered in the markets, and the actual demand for home consumption was for 176,000,000 pounds. If either the American or Asiatic rice had not been supplied, it is evident that the prices must have risen proportionally to the limit of the capacity of the consumer to purchase. This was illustrated in 1864, when the price of Asiatic rice, then in sole control of the market, ranged from \$12 to \$17 per hundred pounds, while the contrary was illustrated with equal force in 1880-'81, when, American and Asiatic rice contending in the markets, prices fell in the Southern markets to \$4.25 per hundred pounds for good rice. Here the minimum was below the average prices for like qualities in 1837, 1838, 1839, 1854, 1855, and 1857, covering the most prosperous period of American rice husbandry!

It is only left to infer that the effect of the import duty has been extraordinary increase in the production of American rice and correspondent reduction of price. In sixteen years, the crops have increased more than ten-fold, and prices have declined from one hundred to one hundred and fifty per cent. It has induced active competition with foreign importation without reducing its volume. The average annual consumption of foreign rice in the past eleven years has been about 50,000,000 pounds, but in 1880-'81 the consumption largely exceeded this amount, having been about 58,000,000 pounds.

It seems, then, evident that the average profits on American rice are at present dependent on the maintenance of the import duty, and that if the latter is removed or materially reduced, the cultivation of the former must be abandoned, as a staple product, and the lands returned to nature. There are now cultivated in rice more than 155,000 acres, affording livelihood to more than 160,000 persons. The tidal rice fields of the Carolinas and Georgia—wherever else indeed in this peculiar hus-

bandry a high condition of drainage and irrigation is observed—are probably as perfectly prepared for cultivation as any lands in the world strictly agricultural. Rescued from marshes and swamps, often impenetrable, they have been thoroughly embanked and drained, until, in general, they readily take the weight of the horse and of the heaviest agricultural machinery. It is safe to state, as illustrative of these facts, that a rice plantation of 500 acres would contain more than 60 miles of ditching and exterior banking, without taking into account the main canals and other contingent, but extensive excavation and embankment, essential to a successful system of drainage and irrigation. It would be supposed, however, that lands thus prepared, evidently at great cost, could be readily diverted to the culture of other products than rice. But, unhappily, this is not the fact, and is one of the unexplained enigmas of agriculture. Once planted in rice, these fields become incapacitated for other profitable crops, until, after the lapse of years, the character of the soil, rendered adverse to dry by the system of wet culture, has been thoroughly reconstructed. To await this reconstruction, occupying several years in its process, or to attempt the conversion of these lands to immediate use by experiment, would amount to their practical abandonment. No planter could afford delay or experiment, at best uncertain, to undertake another kind of culture, of which he has neither knowledge nor experience. He would be forced to abandon his property, and more than 150,000 persons, reared like himself in this special industry, and dependent on it for a livelihood, would be disemployed and impoverished.

If such great developments, as the evidences show, have been achieved in the American rice industry in the short space of sixteen years, to the advantage of all parties at interest—the home producer, the home consumer, and the government—it can scarcely be denied that this industry is entitled to continued encouragement, until home competition is still further increased by enlarged production at minimum cost. It has been already shown that the price of good American rice was reduced in 1880–81 to the average price in several years anterior to the war, when the rice industry was in the zenith of its prosperity. This reduction grew mainly out of an increase in one year of more than 100 per cent. in the crop of Louisiana alone.

With such rapid development as this in the past, it does not appear chimerical, but certain, that without discouragement the domestic production will, probably by the expiration of the present decade, be equal to its amount in 1850, and be larger than will be demanded by the domestic consumption. This result will be practically accomplished, as soon as the great labor-saving machines of the recent system of grain culture become modified, so as to be applied to the peculiar necessities of rice husbandry.

In conclusion, the facts relating to the American rice industry for the past sixteen years go to prove that it is an example, where taxation of a foreign product is sound policy, if not the duty of the government:

First, for the prevention of monopoly in either the domestic or the foreign product, to the advantage of the domestic consumer, as well as of the domestic producer.

Second, for the encouragement and permanent establishment at home of an industry necessary to afford food and hospital supplies in time of war, and so to promote national independence.

Third, because protective taxation has been clearly educational to the domestic product, practically developing it from its infancy, until it has

reached the promise of such successful permanence as in reasonable time to become independent of protection.

Committee.

By Commissioner OLIVER:

Question. Why is it that foreign rice is brought to Savannah when there is a market for it in Northern ports?—Answer. The probability in regard to rice brought here is, that there was no market for it in the North. The markets there must have been filled, and they brought it South in consequence of the absence of rice in our market. Last year the great storm to which I have alluded occurred. It broke down the crop in this immediate section, and the merchants took advantage of the opportunity to bring in rice in order to supply the wants of this city as well as of the country.

Q. It is brought here because Savannah is the distributing point for rice?—A. Yes, sir; it is the leading market on the Atlantic coast.

By the PRESIDENT:

Q. And your people here are large consumers of rice?—A. Yes, sir; very large consumers. Prime Rangoon rice can be brought here and laid down in our ports at \$2 a hundred or less, if brought by sailing vessels direct from Rangoon, and such rice commands here from 5 to 5½ cents a pound. Prime Patna, which is considered the choicest of all the rice produced in the world, and which always brings an extraordinary price, will bring 2½ cents, laid down by steam from England, and ¼ cent less if laid down by sailing vessel, and less still if sent from Calcutta direct. These prices leave a milling profit in England, and commissions for buying and selling.

So you perceive, Mr. President and gentlemen, from this statement, that the present duty on foreign rice will not protect the American producer.

By Commissioner BOTELER:

Q. That is, the duty of 2½ cents will not protect you?—A. No, sir, it will not; because if they can lay down their rice at less than 2 cents they can afford to sell that rice at a profit of 100 per cent., and yet be below the price we are compelled to pay to produce it.

To show you the effect of the present duty, I would like to read an extract from a letter addressed by me last March to a member of the House of Representatives, in reply to remarks of a member from South Carolina in relation to the import duty on foreign rice. The member referred to had spoken as follows in the debate on the agricultural appropriation bill:

In my mind it is apparent that no protection should be given any article beyond that which would place the producer upon an equal footing with the foreign producer in the home market. For instance, 100 pounds of East India rice can be delivered in our custom-houses for \$2.90. It costs our home producer \$4.43 to place a like quantity in our home market. The difference is \$1.43. To this extent I would protect the rice planter and no more. The present tariff on rice is \$2.50 per 100 pounds. This is \$1.07 more than the difference in the cost of production here and production abroad, and just that much more than it ought to be, because it is taking by law from the consumer of 100 pounds of rice \$1.07, for which no earthly equivalent is given.

I say in my letter: I must express my intense surprise that the honorable member should thus go apparently quite out of his way to

attack the second most important interest in his own State. More unfortunately, the effects of his utterances extend beyond the limits of South Carolina, and would be felt in our own State and throughout the South. Fortunately, his utterances can be proven to be both incoherent and unjust.

He expresses himself as opposed to "seeing our custom-house doors thrown open to foreigners, to the detriment, if not destruction, of our home manufactures," and almost immediately follows this up with a proposition for such a reduction of the duty on foreign rice as would destroy the rice industry of the South.

Now, if East India rice is delivered into the American custom-houses at a valuation of \$2.90 per 100 pounds, and the present import duty be reduced so as to place this rice in the home market on an equality with domestic rice, that is to say, at \$4.43 per 100 pounds, evidently the consumer will still pay the difference, or \$1.53, for which, according to the gentleman's reasoning, "no earthly equivalent is given in return." As long as any difference in value is enforced by law as between the two commodities, just so long is the gentleman's proposition incoherent in the moral it attempts to teach. He cannot run with the hare and follow with the hounds!

But practically his proposition leads to a worse conclusion, namely, the cessation of the production of rice as a staple article not only in South Carolina, but in the South at large. Had he examined the subject more carefully, he may have discovered that the present duty, which he condemns as excessive, is not so protective as to insure any profit to the home producer. In 1880-'81 the average price of good domestic rice did not exceed \$5.50 per 100 pounds. It was, in fact, somewhat less, while the price of Asiatic rice would be \$5.40, showing a difference in favor of the former of 10 cents per 100 pounds, or of one-tenth of a cent per pound. This seems to be all the advantage that the present duty gives the average domestic producer. But the maximum price of good domestic rice in the Savannah market in 1880-'81 was \$6.50 per 100 pounds, showing an advantage over Asiatic rice of \$1.10. The minimum price, prevailing for several months of the year, was as low as \$4.25, showing an advantage to Asiatic rice of 18 cents, as against the cost of home production (\$4.43), and that the home producer was actually selling below that cost. Indeed, the average of these maximum and minimum prices is \$5.17 per 100 pounds, and this might be properly assumed, instead of \$5.50, as the point beyond which the average price in a Southern market did not reach in the period named.

There is no enormity revealed here in economic morals, no drastic premium legislated to South Carolina rice-growers, when we find that the average value of Asiatic is greater than that of American rice. If, indeed, we transfer the latter from Savannah to the New York market, and add 75 cents per 100 pounds transit charges, it will reach \$5.92, leaving a margin of 52 cents in favor of the former. Here the two commodities are brought into direct contact. I will here add that Patna rice always commands about one cent per pound more than American rice.

The result is that the present duty fails to accomplish what the honorable member seeks in his proposition, namely, an equalization of price in the two commodities. If his ideal of a just import duty is to be put into effect the present duty should be raised, so as to make the custom-house value of Asiatic or foreign rice, not \$5.40, but, say, \$5.90 per 100 pounds, or to raise the duty from \$2.50 to \$3 per hundred pounds.

But the gentleman means to be just, and means well also to the rice-

growers of South Carolina. To demonstrate this, the duty on foreign rice must be reduced. As it costs \$1.43 per 100 pounds to produce domestic rice, therefore the duty must be reduced to \$1.53 per 100 pounds to equalize values. If now it be assumed that importation of foreign and the production of domestic rice remain the same as in 1880-'81, all other conditions also unchanged, it is evident that the duty so reduced ceases wholly to be protective, while the foreign product will cost the consumer its import value added to its import duty. No profit can remain to the domestic producer if he is compelled to sell at cost prices, and it has been already stated that good American rice was sold in 1880-'81, at fair market rates, at \$4.25 per 100 pounds. This is the necessary result of the proposed equalization of prices, and to legalize this in the name of protection is not merely absurd, but is the condemnation of a great industry, first to decay, and at last to destruction. There can be no better evidence of the struggle between domestic production and foreign importation than the single fact that the average annual consumption of foreign rice for eleven years, including 1880-'81, has been, say, 50,000,000 pounds, while the consumption for 1880-'81 was nearly 58,000,000 pounds.

By the PRESIDENT :

Question. You spoke of the fact of rice being held in bond. What is the effect of the warehousing system upon your industry?—Answer. The effect of the warehousing system is to hold that much rice in terror over us. I mean that it keeps a surplus in bond, which the importers can throw upon the market at any time they please. I can see no other effect than that.

Q. And you regard the system as disastrous to your interests?—A. I think it is disastrous to the extent of that much rice to be carried into the market at the pleasure of the importer.

There is one other thing which I have omitted to speak of, which has just occurred to me. As the members of the Commission are doubtless aware, there is a tax of 10 per cent. on imports brought in foreign bottoms, and I am informed (I do not know whether authoritatively or not) that that tax will be shortly abolished; I think it terminates in January next. That, of course, will add to our difficulties. At present we have the advantage of that tax on rice brought in foreign bottoms; and it is generally brought in that way. The gentleman who gave me that information stated also that there could be no doubt that foreign rice could be brought into this country as cheaply as salt or any other article which comes in vessels as ballast. These are additional reasons showing that our tariff is really too low.

Q. You have made no reference to the rice product of Louisiana. What is its comparative production?—A. Louisiana produces as much rice as the Carolinas and Georgia put together; about one-half of the crop, you might say.

Q. What are the opportunities for extending its cultivation there?—A. I think the opportunities of extending rice culture in Louisiana are very great, and also in this section of the country there is much room for the extension of the industry. All the rice fields in cultivation before the war have not yet been reclaimed.

Q. Is it possible for you to supply sufficient rice for our domestic consumption?—A. Yes, sir. The cultivation of rice is becoming very much expanded in the interior on the higher lands, which are susceptible of producing the grain in the same manner that it is produced in the mountains of the Hawaiian Islands. There is a large amount of rice produced in elevated countries, and much of it is admirable grain.

By Commissioner GARLAND:

Q. You have spoken of the comparative cost of slave and free labor, and, I think, stated that the average cost under the slave system was 20 cents a day, whereas now it is from 75 cents to \$1.25 for males and 50 to 75 cents for females.—A. Yes, sir.

Q. What is the comparative productive value of that labor; that is, for \$1.25 a day do you get as much labor or more than under the old system?—A. The highest rates named are usually paid to expert laborers and under extraordinary circumstances. For instance, after the gale of last year it was necessary to pay higher wages on account of the difficult labor to be performed. Men had to work in the mud and wet replacing trunks which were blown out, and I paid as high as \$1.25 a day for labor.

Q. I inferred from your subsequent remarks about prices of labor that you do not get as much labor in a day now as under the old system, notwithstanding the increase in wages.—A. No, sir; we get nothing like it. The negroes are peculiar in that respect. They live on very little, and, even though paid a high price, do a very light day's work.

I have been requested by one of my associates to call your particular attention (although I alluded to it in my statement) to the great difference in the cost of harvesting rice and crops grown on high lands. I have stated that it is impossible for us to use the mower or horse labor in our fields. We are obliged to cut our rice by hand. I suppose the cost of harvesting crops where machines can be used is comparatively small per acre compared with the cost of harvesting rice. I am not prepared to state what the difference in cost is, as I have had no experience, but I can easily form an estimate that it would cost perhaps not to exceed 25 to 50 cents an acre to harvest a crop by the aid of machinery, whereas to harvest the rice crop with us costs about \$3 an acre.

Commissioner GARLAND. In Illinois it is customary for farmers to contract with parties owning reapers to reap and bind wheat at the rate of 75 cents an acre.

The WITNESS. I was not fully informed in regard to the price, but 75 cents is a low figure compared with \$3, which we have to pay.

Q. Is there any insect which preys on the rice crop?—A. Yes, sir; they are quite numerous. Insects attack rice in all its stages of growth, even in the germ.

After full consultation with my associates, I am authorized to submit the following as the rate of duties we ask upon rice products:

Present tariff designation or commercial name of article.	Present rate of duty.	Proposed rate of duty.
Cleaned rice	2½ cents per pound..	3 cents per pound.
Uncleaned rice	2 cents per pound..	2½ cents per pound.
Paddy, or rice in the rough	1½ cents per pound..	2 cents per pound.
Rice flour.....	20 per cent.....	*3 cents per pound.
Ricina	*3 cents per pound.

* The reason for recommending this is that rice flour and ricina are cleaned rice reduced to flour or meal.

I would like permission to submit, as a part of my remarks, an extract from a speech delivered in the House of Representatives May 2, 1882, by the Hon. C. B. Darrall, of Louisiana, which contains some valuable information in relation to the rice interest. Mr. Darrall said:

The reclaiming of the rich alluvial lands of our Southern coasts, the best rice-producing lands in the world, can only be done at large expense, and in order to be

successfully carried on must have the products of those labors and that expense protected, if it be protected at all, on some permanent basis. I feel safe in saying to this committee that a revision of the tariff on a basis of this kind, with an assurance that it would be permanent for at least twenty years, would, in less than ten years' time, so accelerate the production of sugar that at least 50 per cent. of our consumption of that article would be produced at home, and instead of importing, as we now do, one-third of the rice we consume, we would in the same length of time from now—that is, ten years—not only be producing all the rice we consume, but be exporting it, as we did before the war. And more than this, the prices to our people of both articles would be less than they now are. The statistics of the production and consumption of rice in our country before and since the war are very interesting. Rice, as an article of food, especially in the Southern half of our country, cannot be overestimated. It is highly nutritious and wholesome, in warm climates especially, and much more should be used as an article of food both in warm and colder climates. It is especially adapted to the use of the laboring classes, and its production and consumption by them should be encouraged. The following tables show the condition of the exportation, production, and consumption of rice before the war:

Years.	Tierces.	Pounds.
1791.....	90,980	58,368,000
1800.....	112,050	67,233,600
1810.....	131,341	78,804,600
1820.....	71,663	42,997,800
1830.....	130,697	78,418,200

Beginning with 1840, the statistics, until then wanting in positive data as to production, become more instructive as they become more complete. The following table exhibits the production, export, and home consumption in the decades stated:

Years.	Production.	Export.	Home consumption.
	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>
1840.....	80,841,422	60,996,000	19,845,422
1850.....	215,313,097	68,000,000	147,313,097
1860.....	187,107,032	75,373,000	111,734,032

During the war the whole system of home production, till then so successful, was almost totally destroyed, and the States not in rebellion were compelled to depend entirely on the foreign production. Since the war the production has steadily increased, as has also the consumption. The following table fully illustrates this, and shows that we may reasonably expect, inside of ten years, and perhaps inside of five, to produce all the rice we consume:

Table showing domestic production, exportation, and consumption of rice.

Years.	Domestic production.	Domestic rice exported.	Domestic rice consumed.	Total consumption.
	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>	<i>Pounds.</i>
1865-'69.....	11,592,600	639,080	10,953,520	63,362,280
1866-'67.....	12,206,729	2,212,961	9,993,819	76,851,823
1867-'68.....	14,602,609	1,394,007	13,208,603	63,314,734
1868-'69.....	26,790,260	3,074,043	23,716,157	70,947,011
1869-'70.....	53,937,600	2,232,833	51,704,167	93,900,697
1870-'71.....	47,348,000	2,133,014	45,214,986	73,120,692
1871-'72.....	30,625,000	445,842	30,180,148	93,623,048
1872-'73.....	52,654,400	403,835	52,250,605	114,621,237
1873-'74.....	62,900,380	270,637	62,629,743	120,176,194
1874-'75.....	68,241,400	558,022	67,683,478	113,009,317
1875-'76.....	72,360,800	277,357	72,083,443	119,145,857
1876-'77.....	31,391,800	439,091	80,951,809	133,003,047
1877-'78.....	77,240,400	1,300,982	75,939,418	125,462,837
1878-'79.....	84,739,200	631,165	84,108,095	121,941,380
1879-'80.....	86,096,800	178,534	86,818,266	135,389,719
1880-'81.....	117,766,000	150,451	117,615,549	175,535,691

Retain the present duty on rice, and give the producers assurance that they can depend on that protection for at least ten years, and I venture to assert before the expiration of those ten years we will be producing all the rice we will need, and at a price at least 25 per cent. cheaper than at the present time. Before the war very little rice was produced in Louisiana, but of late years the production in that State has increased to a wonderful extent, being for each of the last three years over 40 per cent. of the total amount produced. And there are in that State enough suitable rice lands, easily reclaimed, and of inexhaustible fertility, to produce at least as much as is now produced in all the Southern States. The rice lands of the one district in that State which I have the honor to represent, including as it does nearly the whole Gulf coast line of Louisiana, from the mouth of the Sabine to the mouth of the Mississippi, are sufficient in extent, if all were reclaimed and worked, to produce at least 100,000,000 pounds of rice. The finest natural rice lands in the world are those bordering on the Calcasieu, Atchafalaya, and Mermentau Rivers, and the Vermillion, Terre Bonne, La Fourche, and other small bayous of that section of the State.

It is the part of wisdom then, Mr. Chairman, to foster and protect these two great agricultural industries, the production of sugar and rice, to the end that the millions of dollars now sent abroad to purchase these articles may be kept at home, that these rich and fertile lands may be improved, and, instead of remaining wild and uncultivated, as they now are, may be teeming with happy and contented people, and that here, right at the door of the great food-producing States of the Upper Mississippi, may be found a market for much of their surplus products; that the barges and boats plying backward and forward on that mighty river may come to us of the South laden with the flour and meal, the grain and meats, the live stock and implements of husbandry produced on the farms of the West and in their factories, and shall go back to them in return laden down with our sugar, rice, and molasses, with our tropical fruits and vegetables.

By Commissioner OLIVER :

Q. The tendency all over the country appears to be against increasing duties materially, and a disposition is shown to cut down the present rates of duty rather than to raise them. In your judgment, if the present duties were maintained, could you make as good progress during the next five years as you have during the past in increasing your production of rice?—A. No, sir; I think not. I think that the present area of rice would remain within these limits; I do not think it would exceed them, and probably it would be diminished. A single disaster, such as the one that occurred last year, would nearly bring about the abandonment of some of the plantations; the risk is too great. That is one of the considerations which should enter into this matter also.

Q. You think that the consumption of foreign rice in this country has increased?—A. Yes, sir. The average importation would be more than 50,000,000 pounds. We have supplied the demand as far as our crops would go, but we have not been the only parties supplying the market. I believe our product is about 117,000,000 pounds, and the importation is 55,000,000 pounds; so we are only about supplying two-thirds of the rice consumed in the country.

By the PRESIDENT :

Q. There is one important element which should be taken into the calculation in all these matters, and that is the comparative rate of money in this country and abroad. Will you please state to the Commission the system under which money is supplied for carrying on this business and the rates that are paid for the use of it?—A. As a general thing the money used for running the rice plantations is supplied by factors who usually require about 10 per cent. interest for their money. In addition to that they get a commission usually of 2½ per cent., which makes the actual cost of selling the rice 12½ per cent. That is really a very serious burden.

Q. And that is inseparable from the condition of your industry here?—A. Yes, sir; on account of the very uncertain character of our industry the factor cannot rely with confidence upon getting his money

returned at the end of the season. I believe the fact is that the majority of planters last year had to get their factors to carry over their debts to this year.

Q. Is not a permanent tariff a very important element in connection with this matter?—A. Yes, sir; it is. I know personally that some of the rice-planters are seriously meditating the abandoning of rice culture and are endeavoring to get into something else, because of the suggestions made that the tariff on rice would be reduced. They are very much alarmed about it.

Q. If the rice production, owing to the circumstances which you have stated, should cease, and the planters be obliged to suspend operations, they would lose the value of the whole plant and capital invested, the same as would be the case with an iron or cotton manufacturer?—A. Yes, sir; it would be practically useless.

Q. It would literally wipe out the property?—A. Yes, sir; it would.

By Commissioner BOTTLER:

Q. And the laborers would be thrown out of employment?—A. Yes, sir. Hutcheson's Island, across the river here, is an illustration of that. The island was embanked at the public expense in the best manner, and the parties who leased it, having run it for three years and lost \$30,000 on it, have given the city the \$5,000 bonus to allow them to give up the contract. That property lies within 600 feet of the city of Savannah, and it is a good illustration of what I mean.

I should like to call the attention of the Commission to the position of the South on the tariff before and since the war. Anterior to the war there was a very large free-trade element in the South, but I think that the Democratic party and the then Whig party of the country united on the proposition, very generally, that there should be a tariff for revenue with incidental protection. Whatever industry required protection I think, as a rule, our people were disposed to allow; that was the doctrine laid down by Mr. Polk, the candidate of the Democratic party. Since the war the latest declaration we have had comes from Mr. Stephens, the present Democratic candidate for governor of the State. He has come out distinctly declaring his advocacy of a tariff for protection, but with an equalization of the impositions of the tariff. Mr. Stephens is not explicit or clear in his statement, but he shows very clearly he is in favor of protection. When a citizen as distinguished as he is goes before the country and makes such a statement, it may be supposed that he would not do so unless he was sure he was going with the popular current, and I think it should be considered as an illustration of what the views of our people really are.

J. H. JOHNSTON ET AL.

SAVANNAH, GA., *Sept. 25, 1882.*

Mr. J. H. JOHNSTON, chairman of the committee from the Savannah Cotton Exchange, addressed the Commission as follows:

We have been appointed by the Savannah Cotton Exchange to present to you the views of that body in relation to two of our most important productions, the tariff on rice and the tariff on cotton-ties. I will present the views of the Cotton Exchange in relation to the tariff on rice, and Mr. Warren will present the views of the Exchange on the subject of cotton-ties.

The undersigned, merchants of the city of Savannah and members of the Savannah Cotton Exchange, were appointed to lay before your body a statement of facts relative to the rice interest, an interest of considerable magnitude in this vicinity.

Rice is planted principally upon lands that can be irrigated or drained by incoming and outgoing spring tides on our fresh-water rivers.

There are on the various water-courses tributary to this city over 40,000 acres of alluvial land, tilled by over 8,000 freedmen, the only portion of our population who can live on these low lands, subject to the worst forms of malarial fevers, and to whom is paid annually, by weekly payments, over a million and a half of dollars, supporting over 25,000 souls—laborers and their families. The amount of land devoted to the cultivation of rice in the Carolinas is about the same as in this vicinity, while the amount of land in rice culture in Louisiana is about equal to that of Georgia and the Carolinas combined.

Necessarily the price of labor on these unhealthy low lands is higher than in other sections of this southern country. The growth of weeds and grass on these rich lands is very great, and requires constant and careful working, and the keeping up of expensive levees and the cleaning out of canals and ditches (made foul by alluvial deposits), causes annually heavy outlays of money.

To do away with the tariff on rice, or allow it to be introduced free of duty through the Sandwich Islands, brings into this country (in competition with an article produced by the most extravagant labor) an article produced by the cheapest known labor, because of all slave-labor the most degraded and of all people the most revolting are those cultivating rice in foreign countries.

It is the experience of a portion of this committee (as factors furnishing the money to planters to pay the laborers) that the rice planters have not been making money for some years back, for, independent of extraordinary expenses, they have, besides other vicissitudes, been visited by storms and cyclones that broke their levees and inundated or swept off their rice, thus not only taking away their profits, but often have been brought in debt to their factor. To do away with or reduce the present tariff on rice would stop the production in this southern country, and turn these rich lands back to an uncultivated waste. It is a demonstrated fact that these lands now devoted to rice culture can be worked profitably only with rice.

In giving up rice culture a large body of laborers, skilled in the cultivation of this grain, and illy adapted to any other skilled work, would be thrown out of employment. Many would become paupers, and the balance would obtain work only at very reduced wages. It was fully shown during the interregnum of rice culture, viz, between the years

1862 and 1866 that the rice-field hands made very poor laborers when placed in the corn and cotton-fields, and as soon as they were able to do so returned to the low country and again sought the old rice-fields. With rice at the present price only a reasonable profit is realized by the producer; take the tariff off, and foreign rice can be imported and sold at a price that would effectually stop the production of rice in this country. It is very evident that the high priced free labor of this country cannot compete with the cheap and degraded slave labor of China in the production of rice. The most inferior laborer in a rice-field can earn \$200, a skilled hand over \$300 a year; the same skilled laborer in China to be had from \$15 to \$18 per annum.

The committee beg leave to submit figures to prove certain facts, viz, that the present price of rice affords to the producer only a fair profit on his capital. Take the value of a rice plantation of say 300 acres (an average one):

The land would be worth say.....	\$15,000
Necessary buildings, mill, thresher, &c.....	5,000
Necessary outfit, mules, implements, tools, &c.....	5,000

Total capital invested.....	\$25,000
7 per cent. on \$25,000.....	\$1,750

Three hundred acres of good rice lands, under good cultivation, should produce, say, 35 bushels per acre, 10,500 bushels. Of this—

8,000 bushels first quality rice, worth \$1.40 per bushel.....	\$11,200
2,500 bushels second quality rice, worth \$1.25 per bushel.....	3,125

Total 10,500 bushels, worth.....	\$14,325
From this must be deducted the cost of getting to market, freight, insurance, commissions, and charges, about.....	1,300

Net amount.....	\$13,025
From this amount now must be deducted cost of production, about.....	11,000

Profit, net.....	\$2,025
------------------	---------

One dollar and forty cents per bushel in the rough is equal to 6 cents per pound in the clean state.

Let us see now what are the fixed charges that make up this \$11,000, which is called cost of production.

Take again a first-class plantation of 300 acres:

	Total cost.	Cost per acre.
Cleaning up field preparatory to planting.....	\$300	\$1 00
Plowing and harrowing.....	600	2 00
Seed for 300 acres; 750 bushels, at \$1.75 per bushel.....	1,300	4 25
Sowing, planting, and covering.....	200	75
Hoeing with horse-hoes.....	150	50
Hoeing with hand-hoes (three times).....	1,200	4 00
Banking (repairing banks, topping, and strengthening wash places and cleaning ditches).....	1,000	3 25
Trunks (repairing) and making one new one each year.....	750	2 50
Harvesting, cutting, tying, and stacking.....	750	2 50
Hauling and floating rice from fields to mill to be thrashed.....	450	1 25
Thrashing (mill work).....	800	2 50
Feed for mules (seven head).....	850	3 00
Overseer, \$1,000; foreman, \$300; watchman, \$240; trunk-minder, \$240.....	1,840	6 00
Incidentals, replacing implements worn out, replacing mules that have died, annual repairs to mill and thrasher, extra work.....	1,000	3 25
	\$11,190	\$36 75

A rice plantation in this section cannot be cultivated for less than \$35 to \$40 per acre. As factors we can say we have furnished oftener \$40 per acre than \$35 on first-class rice lands; on light black lands, \$25 to \$30 per acre; but the production of these lands is less to the acre than the first-class clay lands, 30 bushels per acre being a good yield on such lands. To take off the tariff to make the price of rice 25 to 50 per cent. cheaper, through the introduction of foreign, would in the end work disastrously to those desiring the article at a cheaper figure. Competition the first year, through an overimportation of rice duty free, would of course bring the price down that year, and in so doing the production of domestic would be stopped. The foreign rice having no competition, prices would be run up by speculators to figures higher than when the tariff was on. This was shown to be the case during 1862 to 1866, when foreign rice had no competition from domestic, and it was shown again this last season caused by a short crop of domestic through an injury to the rice on the Atlantic by the cyclone in August, 1881.

The price of foreign rice during this last spring and summer has been too extravagantly high, and prices only began to recede when the new domestic appeared in the market.

To keep an even price and a fair price to the consumer such a duty should be placed (as at present) upon foreign rice as not to prevent its introduction; for with the introduction of foreign under the present tariff a healthful competition is kept up between the foreign and the domestic; but let the domestic be run off by the introduction of foreign duty free, the consumer will have to pay to the speculator in a very short time a higher figure than now current and for an inferior article.

In relation to allowing the importation of rice free of duty from one favored spot, the committee will not take up the valuable time of the Commissioners to point out to them self-evident truths, viz, either the injustice to other nations less favored or to show how rice from other rice-producing countries can be and is first imported into these favored islands and then exported as the product of these islands, and though denied, we all know that the ingenuity and enterprise of man can and does overcome all obstacles where the venture is to result in certain gain.

J. H. JOHNSTON.
C. N. HAMILTON.
H. FRASER GRANT.
J. L. WARREN.
H. M. COMER.

I have been asked to further explain a point made in this paper. I have put the price of first quality rice at \$1.40; whereas in my list of expenditures necessary to make a crop I have put seed rice at \$1.75. It is very evident that the best part of a crop is kept for seed rice. There are some people who only cultivate rice for seed. The grain must be better; it must be worked and cut more carefully, and allowed to remain in the fields a little longer, so as to ripen more thoroughly. In that way the cost of seed rice will be a little more than the other rice.

Commissioner BOTELER. That is the case with all seed.

By Commissioner GARLAND:

Question. What recommendation do you make with reference to the tariff?—Answer. I am hardly able at this moment to say. Under the present tariff a great deal of rice is sold below the cost of production.

If we could keep rice at from 6 to 6½ cents a pound a reasonable profit could be made; but there is an overimportation, and we have to sell rice at 5½ cents in order to compete with rice which is sold at that figure, and that cannot be done profitably. I have made no calculation in regard to the rate, but I have no doubt the gentleman who preceded me (Colonel Screven), on consultation with his friends, will fix upon a rate.

By Commissioner BOTELER :

Q. If the duty were raised to 3 cents a pound the stimulus would be greater, of course, for parties to go into rice culture. Would or would not the result of that be a reduction in price to the consumer?—

A. Of course the more rice we can produce in this country the cheaper the price will be. I think one reason why so many people are deterred from planting rice is on account of the extraordinary expense that is necessary. In rice culture every planter must settle with his hands weekly; whereas in cotton culture at the end of the year they pay off their hands either in kind or in money, say \$150 to a hand. But in the cultivation of rice you not only have to pay weekly, which of course adds interest on these weekly payments, and which counts up very considerably, but at the end of the year you have paid to your rice-field hands about double what would be paid to cotton-planting hands.

Q. What would be the effect on the increase of production in this country if it was understood that the duty was to be a permanent one?—A. The effect of an increased duty would be to enhance the production. The rice planters desire to be satisfied that there will be a duty which will protect them. This uncertainty about the rate of duty has been hanging over their heads like a drawn sword. If you put the tariff on a permanent basis it will encourage the men who are now engaged in the cultivation of rice, and also encourage other parties to engage in the same business, and of course that will result in a greater increase of production and a lower price of the article. The consumer would be benefited by such a tariff as will enhance the production. I have never visited Louisiana myself, but I have been told by parties who are familiar with the cultivation of rice there that the land which can be devoted to its culture is almost unlimited.

By the PRESIDENT :

Q. Might not the assurance of a moderate duty—the duty which exists at present, for instance—be more effective and give more encouragement to the rice grower than a higher duty which had not that element of permanency?—A. Yes, sir. I think the rice planters would rather have the present duty assured to them; but there is no doubt that a little higher duty would increase the production so much more as to bring about the results desired by those who advocate the introduction of rice into this country free of duty.

By Commissioner OLIVER :

Q. You represent, I understand, the Cotton Exchange of this city?—A. Yes, sir.

Q. That is the leading commercial body of Savannah?—A. Yes, sir; it is the only commercial body which we have here. Its membership comprises 250 persons, embracing all classes of merchants on 'change.

Q. You are chairman of the committee from that exchange?—A. Yes, sir.

Q. Of course, then, you come in contact with business men in this section of the country. In that view I will ask you if, in your judgment,

there is any demand from the business men or people of this section for a radical change in the present tariff laws on all articles, including rice?—A. I do not think there is. The South before the war was anti-tariff, and desired a tariff only for the purposes of revenue. I think the change in our mode of doing business and in our labor system has brought about a different opinion in that respect. I believe the people of the South are now more in favor of a tariff than they were before the war. Next to some of the New England States, Georgia is the greatest producer of cotton goods and yarns in the country, and is developing a large coal and iron industry.

Q. Do you think the sentiment of your people is this: That where there are wrongs in the present tariff they should be righted, but they would be satisfied with the duties about as they are, excepting only in the specific matters which you recommend; but above all they desire permanency in the tariff rates?—A. Yes, sir; that is what we want—permanency more than anything else.

By Commissioner BOTELER:

Q. And simplification of the tariff?—A. Yes, sir. We do not come in contact here with dutiable articles, except in the way of consumption, and we do not feel the duty. We have not looked into the subject perhaps as closely as the people of the North, who consume so much more and are brought more in contact with the tariff laws.

Mr. J. L. WARREN, one of the committee, said:

Having been appointed a committee by the Cotton Exchange of Savannah for the purpose of laying before you our and their views in regard to matters especially affecting the interests of this section, we respectfully submit for your consideration the following suggestions in regard to the duty on cotton-ties.

We think the present ad valorem duty of 35 per cent. is quite as high as the consumers can stand, and is decidedly preferable to the proposed specific duty of 1½ cents per pound on them. The present duty of 35 per cent. ad valorem makes them cost at the ports to consumers \$1.50 to \$1.60 per bundle of 55 pounds. The proposed specific tax of 1½ cents per pound would increase the cost to \$1.75 to \$1.85 per bundle. The prime object of a tariff is the raising of revenue—is in this form to tax the people, for the purpose of defraying the proper expenses of the government. Protection and fostering of American industries is a necessary natural consequence of this form of taxation, and must be in proportion to the extent of the taxation—the amount of the duty levied. When the duty imposed raises more revenue than is necessary for the legitimate wants of the government it becomes spoliation, improper oppression of the people. When the duty becomes so heavy that it is not merely protective but prohibitory, it ceases to produce revenue, which is the prime purpose of a tariff, is of no benefit to the government, and becomes legalized robbery of the great mass of the people who are consumers, for the sole purpose of enriching monopolies, which are composed of a favored few. To increase the duty on cotton-ties to any considerable extent would prohibit their importation, increase the burden of their consumers, and result in making the duty on them bring no revenue to the government, but put the entire amount of their increased cost into the coffers of the manufacturers of them.

The duty on hoop iron, 1½ cents per pound, is practically prohibitory, and drives away from our custom-houses and our markets its manu-

factures of other countries. The government derives no revenue from it; all the burdens are borne by the consumers, and all the benefits are enjoyed by the manufacturers. The consumers simply pay a tax, not to the government, but to a favored few of their countrymen, who receive the revenue derived from class legislation. Should the duty on cotton-ties be changed from the 35 per cent. ad valorem to the 1½ cents per pound specific, our consumers, who embrace every cotton planter and every laborer on a cotton farm in the United States, will pay about one million dollars more of taxation per annum for their ties, which, with the revenue now derived from this source, will all be diverted from the pockets of the masses and the treasury of the government to the manufacturers. The idea that the cotton planters get back their money from the purchasers of our raw cotton which they expend for bagging and ties is we, as cotton merchants and cotton planters, know to be untrue. The purchasers take our cotton bales at about 5 per cent. The farmers get no return for the amount they pay in duty, but bear all the burdens imposed by it. We are entirely willing to pay our proportion of the expenses of the government, prefer to do it entirely by the tariff system, to the abolition, as soon as practicable, of the internal-revenue system, but think there should be such an adjustment and reform of the tariff as will equalize the burdens of this, the best form of American taxation, and make it, while raising the necessary revenue, bear alike on all, and at the same time incidentally protect, fairly and equally, all American industries. A tariff based upon these principles, which will raise sufficient revenue, would afford all the protection to all American industries needed by them.

J. H. JOHNSON.

M. HAMILTON.

H. M. COMER.

J. L. WARREN.

H. FRASER GRANT.

By Commissioner OLIVER:

Question. You agree to the statements presented in the paper submitted by the chairman of your committee in regard to maintaining the present duties on rice?—Answer. I do.

Q. There are manufacturers of cotton-ties in Ohio and New York who ask for a proportionate rate of duty on ties as compared with other manufactured articles of iron. Cotton-ties now, at an ad valorem duty, are dutied at the lowest rate of any article of iron coming into the country, except pig or scrap-iron; that is to say, the duty is only about \$12 a ton. They ask, as they have to pay wages proportionate to other manufacturers, to be allowed a proportionate protective duty. Now you are asking that a duty on a product peculiar to this section be maintained, which would on the average of prices ruling for the last twelve or fifteen years be equivalent to 50 per cent., and from your argument I am convinced that you should have a duty of at least 60 per cent. to bring the rice culture of the country up to what it should be. In that view do you not think these other people should be entitled to a proportionate duty on cotton-ties?—A. No, sir; I do not think so, and you may perhaps want my reason. The custom-house returns for the year 1878 and 1879 show that in those years there were very few importations of cotton-ties; that almost the entire amount used on the six or six and a half million bales of cotton which the South produced were manufactured at Youngstown, Ohio, and Pittsburgh, Pa. The duty upon other articles of manufactured iron being higher, they have turned

their attention to the manufacturing of them and neglected this. If you raise the duty upon iron ties to that on hoop iron you will virtually have a prohibitory tariff, which will exclude the foreign article, and which will put the whole amount of this revenue which now goes to the government, and a million more into the pockets of the manufacturers without a particle of benefit to the cotton interests.

Q. In 1878-79, you say that cotton-ties were supplied almost wholly by American manufacturers?—A. Yes, sir.

Q. Were they not the cheapest ties that the southern people have had for the last ten or fifteen years?—A. Yes, sir.

Q. Therefore, while the American manufacturers were supplying the southern market, the southern people got their ties cheaper than they got them from England before or since; is not that the fact?—A. I think not. My associate here, Mr. Comer, (who is a large importer of iron ties), has these figures before him, and I would prefer that he should answer that question.

Commissioner OLIVER. Certainly, I only want information upon the point.

Mr. H. M. COMER said:

I have here a statement which it was intended should be appended to Mr. Warren's remarks; but it was not prepared in time. In 1877 we began to receive ties from Pittsburgh, via Baltimore. I find that in 1877, the average price of ties to the wholesale dealer was \$2.50 per bundle, less 10 per cent. In 1878, they were \$2 per bundle. In 1879, they were \$2.50 per bundle, less 5 per cent. We are now selling imported ties at \$1.50 per bundle, and sold them at that price last year. This statement which I have referred to has been prepared from the invoices of about 25,000 bundles of ties which came in this year. Mr. Johnston, the collector of the port, kindly allowed me to look them over and make memoranda of each invoice, and I have brought this statement here to corroborate these facts.

IRON COTTON-TIES.

[Average weight per bundle, 53.0134 pounds.]

Invoice cost of 25,277 bundles ties (imported in June, 1882)..... £4,800 16s. 10d.

Amounts to, in United States currency, at \$4.84.....	\$23,236 07
Duty, 35 per cent.....	8,177 20
Freight, at 7s. 6d. per ton.....	1,092 86
Marine insurance (estimated).....	340 00

Total cost laid down..... \$32,846 13

Average cost per bundle.....	1.2994
Average cost per pound.....	.024528

ESTIMATE.

Same original cost.....	\$23,236 07
Specific duty, 1½ cents per pound.....	20,094 00
Freight, at 7s. 6d. per ton.....	1,092 86
Marine insurance (estimated).....	340 00

Total cost laid down..... \$44,762 93

Average cost per bundle.....	1.778
Average cost per pound.....	.033566

Total additional tax on estimated crop of 6,500,000 bales cotton, \$622,700, to which add additional expenses in way of fire insurance, interest on investment, &c., and we approximate \$1,000,000, or about 15½ cents per bale additional tax on the cotton crop.

Mr. COMER. You asked Mr. Warren the question whether or not the ties in 1877 and 1878 were not the cheapest ties that the planter ever had. I answer no.

Commissioner OLIVER. But they were the cheapest ties the planter had had up to that period?

Mr. COMER. I would not like to answer so important a question as that without referring to our books.

Commissioner OLIVER. I think any one in the country who used them would know that they gradually came down in price up to 1868.

Mr. COMER. We did not get all our supplies in 1877 from this country; some of the ties were imported. In 1878 all were made in this country, and in 1879 nearly all were made in this country—I expect quite all, because I notice we had two large shipments from Baltimore in 1877; according to this statement the total additional tax would amount to \$622,700. That is what the additional duty would amount to

By Commissioner OLIVER :

Question. Would not the manufacturer who supplied all the ties in 1878 come in the same way, and argue that where your ties cost you for a while 6 cents (about 1872) that the duty reduced it about one-half and had saved you that much?—Answer. I do not think it would apply in this instance.

Commissioner OLIVER. That is because you will not let it apply.

The WITNESS. I mean because the article was a patented article.

Commissioner OLIVER. It was in the hands of a monopoly, and they charged you what they pleased.

The WITNESS. But that is not the case now. The cost of the ties here is about \$1.29 landed, and we are selling them at \$1.50 wholesale.

Q. All that are now used practically come from England?—A. Yes, sir.

Q. Everybody will concede that it is of the greatest importance that a crop like the cotton crop should be handled properly, and it cannot be handled properly unless these ties are used. Do you think it a good business plan to depend entirely upon a foreign country for an article so indispensable as a cotton-tie?—A. I do not think it would be right for us to depend upon them entirely; but I do not think we do, as things now are.

Q. Practically, every tie that is consumed is made in England. In case of a war or an embargo there would be of course a difficulty in getting them from England. Do you not think it would be right to give the manufacturers of this country protection enough so that they would be able to supply a part of this trade, so that they could keep their machinery running and be able to supply a part of this most important requisite?—A. I will answer that question by saying that in 1877, 1878, and 1879 cotton-ties were made in this country under a duty of 35 per cent. ad valorem, and the reason they do not make them now is that they are manufacturing other things on which there is more profit. It requires very little additional skill to manufacture the ties. It is merely hoop iron with a fastening at one end.

Q. We have had witnesses before us this morning who very nearly convinced me that protection had reduced the cost of rice to the people of the country; that rice would have been at a very high figure if it had not been for the protection given to its culture here. They showed that a certain amount of protection cheapened the production. Do you think that protection is a very good thing for rice but not a good thing

for cotton-ties?—A. No, sir. But, in the first place, we have a large laboring element here who can do hardly anything but cultivate rice. To give them employment increases the crops, and therefore reduces the price of rice. Whereas in the iron interest it is different. There are only eight or ten hoop-iron manufacturers in the United States. By taxing cotton-ties you would only increase their business and put a very large profit into their hands; and the very laborers that you want to protect would be the losers by it. So that when you analyze the matter it does not appear to be as inconsistent as it seems to be at first.

Q. This is only argument; now we will come to the practical point. What is your judgment in regard to imposing a specific duty per pound upon cotton-ties instead of an ad valorem duty; would it not make the duty more uniform at every port?—A. Yes, sir; I think that would be preferable.

Mr. T. F. JOHNSTON, collector of the port of Savannah, who was present, was interrogated as follows:

By Commissioner OLIVER:

Question. We have received very valuable information from heads of departments in the New York custom-house, and we would like to know if there are any suggestions you can make in regard to the workings of the tariff law here in Savannah?—Answer. I do not think that we are suffering from any of the requirements imposed under the customs laws, except, perhaps, in the matter of surveys held upon foreign invoices of goods. Where the point is raised as to the market value of the goods we generally have a survey. Two government appraisers are appointed, and I select an outside merchant, and those three parties consider the matter. If they fail to agree the matter comes back to me for decision. Of course the merchant in that way is in the minority, but I do not know that he is at any disadvantage from that cause, because I pick up at haphazard any merchant I may meet, and I suppose the decision arrived at is as impartial as can be obtained in any other way.

By Commissioner GARLAND:

Q. Can you suggest any remedy for that defect?—A. Perhaps it would be well if the importer were allowed to select one of the appraisers and the government one, and these two, failing to agree, could select another person, as is done in all cases of arbitration. I have listened very attentively to the remarks of Colonel Scriven. I am not prepared to say that the protective tariff on rice should be increased. I think the present duty should remain as it is.

Q. Are you ever called upon to exercise your authority in the matter of raising the invoice price of goods imported here?—A. No, sir; that is a very rare occurrence. It is very rare that the duty has to be increased. I had a case where the question was raised in regard to the market value of cotton-ties in Liverpool. Mr. McComb, being a large importer, it was held by Mr. Packard, the consul at Liverpool, that he had a monopoly of the business, controlling a large quantity of these ties, having large means, and that he could buy them up when the season was dull and there was very little demand for them, and hold them until there was a demand, thus creating a monopoly.

By Commissioner OLIVER :

Q. All that would be obviated if there was a specific duty ?—A. Yes, sir.

Q. You say it has been the custom to accept foreign invoices, and you generally find them correct ?—A. Yes, sir ; we generally find them correct.

Q. The consular invoice is generally accepted here ?—A. Yes, sir.

Q. Are dry goods imported here ?—A. No, sir ; they usually come from New York. We have no bonded line from New York here, and therefore they are handled in New York City and sent out here as appraised.

G. M. POLLITZER.

CHARLESTON, S. C., *September 26, 1882.*

Mr. G. M. POLLITZER, commission merchant, of Charleston, S. C., addressed the Commission as follows :

The subject I wish to speak upon is not one of local interest, but affects the entire country, and, while it may not seem to be of special magnitude, viewing it on a broad scale, yet at the same time, as you are visiting all sections of the country and considering all these questions, I desire to call your attention to the excessive duty on salt.

This article is no sectional commodity, but is alike distributed throughout the land, for man and beast, and yet subjected to an import duty of nearly one million dollars.

The following table shows the imports and duty paid, as compiled by our government, for the year 1881 :

	Quantity.	Value.	Duty.	Per 100 pounds.
	<i>Pounds.</i>			<i>Costs.</i>
Imported in sacks, barrels, and packages	412, 442, 201	\$1, 242, 542 55	\$494, 930 73	12
Imported in bulk	529, 301, 042	658, 067 64	423, 488 77	8
Total	941, 803, 333	1, 900, 610 19	918, 419 50

Salt costs, on an average, f. o. b., in sacks, 15s. sterling in Liverpool, in bulk, 9s. 9d. sterling in Liverpool, or in currency (sack), \$3.64 per ton of 2240 pounds, (bulk), \$2.37 per ton of 2240 pounds.

The duty per ton (2240 pounds) on salt in sacks is \$2.69; percentage on cost, 74 per cent.; in bulk, \$1.79; percentage on cost, 75½ per cent.

Calculating from the compiled table above the duty on the "value," the percentage, as shown by me, will not appear, for in aggregate "value," the duty charged is already included.

It will no doubt be claimed that the American salt mining interest demands protection. This I cheerfully indorse (only at lower tariff rate), but it appears to me that the transportation to our shores from England, in itself gives the producer in this country a large percentage in favor of his production.

Freights during the past year to American ports ruled to New York 2s. 6d. to 12s. 6d.; Boston, 4s. to 15s.; Baltimore, 6s. 3d. to 10s.; New Orleans, 5s. 6d. to 7s.; Charleston, 5s.; Savannah, 5s., &c. The currency value of these freight rates, is already a large difference to make good the higher cost of labor in this country, and the less need of so heavy a tariff.

In my humble judgment so important a commodity to an entire people should not be taxed at nearly twice its cost, and I leave the wisdom of this to your superior knowledge to name in your report a tariff rate, just to American producers and yet more lenient to the people of this country.

This appeal is not called forth for individual advantage, but only to assist with my limited judgment, one measure under my immediate knowledge deserving your attention.

My own belief is in a protective tariff, the necessity of which is patent, but one measured by justice and reason alike to producer and consumer.

By Commissioner BOTELEK :

Question. Do you think a reduction of the tariff on salt would have any effect upon the price of the domestic product?—Answer. I should not suppose it would, for the reason that the freight is already an important item, and tends to counterbalance the increased cost of labor in this country. I would not recommend the removing of the tariff on salt entirely by any means. I only desire to call attention to the fact that the duty is extremely excessive on an article that is of such universal use.

Commissioner BOTELEK. The salt manufacturers of my own State, West Virginia, say that they cannot exist if there is any reduction in the duty.

The WITNESS. No doubt manufacturers at all times would like to have a protective tariff, and the greater it is, the greater their profit on the cost of manufacture. But I think the interests of the consumers should be as well considered as the interests of the producers.

Commissioner BOTELEK. It was looking to the interests of the consumers as well as the interest of the producers, that I asked the question, because, if they are correct in what they say of the effect of the tariff on their own business, and are obliged to abandon it on account of a reduction in the tariff, then what effect would that have upon the price of salt to the consumer, in your opinion?—A. I do not think it would affect the price materially. We depend entirely on foreign salt here in Charleston. I know of but one case where there has been any importation of Syracuse salt here. All of the Gulf ports depend upon foreign salt, except, I believe, New Orleans, and there they use some of the other salt. It is the excessive rate of duty to which I call attention; not that I would have the duty removed altogether, for I believe in the necessity of a protective tariff in this country. I only recommend that the tariff be put on a more moderate scale.

By Commissioner GARLAND :

Q. What is the wholesale price of salt here?—A. It varies. This is a peculiar market, easily depressed or elated. A cargo brought here to-day would probably bring 80 cents per sack.

Q. A sack weighing how much?—A. About 200 pounds as delivered here.

Q. Is that in bond or duty paid?—A. Duty paid. The actual prime cost of salt in sacks is 37 cents, to which the duty is added of 24 cents a sack.

Q. The Saginaw, Mich., salt manufacturers told us that their wholesale price for a barrel of salt containing 280 pounds was 70 cents a barrel; what have you to say in regard to that?—A. If they can sell salt at that price they are in a good position to meet the foreign market, because it costs in sacks 37 cents abroad, and the duty is 24 cents, making 61 cents actual cost, to say nothing of freight, insurance, and commission charges. Then there is 11 cents to be added for freight, making 72 cents, independent of the insurance and other charges.

Q. They are selling salt, then, at less than it can be imported for?—A. Yes, sir; that is what I say.

W. L. TRENHOLM.

CHARLESTON, S. C., *September 26, 1882.*

Mr. W. L. TRENHOLM, of the firm of George A. Trenholm & Son, commission merchants, of Charleston, S. C., addressed the Commission as follows :

GENTLEMEN OF THE COMMISSION: I desire to say a few words upon the subject of the duty on rice, and give some reasons why I think it is proper to give it the benefit of protection. As long as the country adheres to any form of protective policy, it seems to me that rice must be recognized as fulfilling all the conditions of an article to be protected. Without protection its production will cease. I think the Commission can satisfy itself as to that point by interrogating any one of the gentlemen here who are familiar with the subject.

Under protection, a large amount of capital, a vast area of land, and numerous laborers have become committed to this industry, and if that protection is withdrawn the capital will be lost, the land will be abandoned, and the laborers will suffer.

If any one were given a piece of waste or swamp land suitable for the purposes of rice culture, and desired to convert it into a rice plantation, it would cost him at least \$50 an acre outlay, in cash, for preparation, before he could sow his seed, and then it would take him several years of continuous cultivation and tillage before the annual crop would more than pay (if it would quite pay) the expenses of cultivation. In other words, to create a rice plantation a very large investment of capital is required. It is not like ordinary farming land or prairie land, where you can plow the land and put in the seed, and the crop will grow. Rice land has first to be selected, and engineering skill is necessary in its location. It must be prepared with canals, ditches, river-dams, sluices, trunks the condition of the tide-water has to be considered, the pitch of the land, and the soil, and if mistakes are made in any of these respects, the whole amount invested is lost. So that rice culture is more like the manufacturing industries than any other agriculture that exists in the world.

Rice is indispensable in time of war. During the Confederate war the States adhering to the government were dependent upon foreign rice, and although the Confederate States had no effectual naval force, the price of imported rice in New York of an assimilated grade to the domestic variety (viz, Para) ranged from 8 cents per pound in 1862 to 14½ cents in 1865. Should the domestic production cease and the whole country become dependent upon foreign supplies, a war with any power of naval resources would result in great and irremediable embarrassment. As rice is a perishable commodity, the supply must be continuous. No exigency can cause an ekeing out of stock from one season to another. The tabulated statements which I shall present show the sources and distribution of imported rice. From these it appears that our largest supplies come from the southern countries of Asia and are consumed in the Pacific States of the Union. Of the imports into Atlantic and Gulf ports, England furnishes 72½ per cent.; this is mostly East India rice cleaned in London. These imports into the Atlantic and Gulf ports are to a large extent held in bond and re-exported; the duty

they pay to the government is inconsiderable, and the whole quantity consumed in 1880-'81 was only 736,682 pounds. Now there is no doubt that the Chinese in the Pacific States consume nearly all the rice imported on that side of the continent. Through the medium of the duty they are made to contribute to the maintenance of the government, and probably this is the only contribution they make.

To reduce the duty or to take it off would be to relieve the Chinese of that contribution, but it would not materially benefit any other residents of the Pacific States; on the contrary, if the duty on rice were removed and the price in California reduced, the Chinese would probably consume more rice, and consequently fewer even than they do now of the products of the country around them, and to that extent the change would be injurious to the farming interest there. The effect upon the rest of the Union of removing the duty would probably be to gradually extinguish the rice production of the South and to substitute foreign for domestic rice. It may be thought that such a change will benefit the commercial interests of Boston and New York, by increasing their trade with the East Indies, but besides the fact that, at present, nearly the whole direct importation of rice from the East Indies is by way of the Pacific, and that now all that New York and Boston get is at second-hand from England (which course of trade is hardly likely to be changed by removing the duty), it is to be considered that should the duty be removed, whatever rice may be imported from sources of production in the East Indies directly to United States ports on the Gulf of Mexico or the Atlantic seaboard will probably come in the rough; that the largest consumption east of the Rocky Mountains is in the country supplied from New Orleans, Savannah, and Charleston; that at these places there already exist skilled labor, machinery, capital, and the appliances of a distributive trade, especially adapted to milling and marketing this article, and that the voyage from the East Indies to all these ports is shorter than to New York and Boston. These things being considered, it seems only reasonable to suppose that while the process of extinction is working itself out in the rice-producing industry of the South, the foreign importations will become gradually attracted to what are now the chief distributing centers in the trade in clean rice, and that consequently the Northern ports will be in danger of losing whatever of that trade they now have.

It seems to me that so far from reducing or removing the duty on rice, good policy would suggest its being increased, and no doubt the representatives from the Pacific States will support this view. At any rate it is of supreme importance to have the future status of the duty as nearly settled as anything of the sort can be, and it seems to me that this can be approximated if not secured by taking the strong and decided ground that the facts of the case supply.

The rice interest of this State is the oldest special industry in the United States. It dates from a time anterior to the beginning of the eighteenth century; it was of incalculable value and importance during the Revolutionary war; and now, in connection with the similar interests of Georgia and Louisiana, it has as good a right to national recognition and protection as any other interest, wherever it may be situated.

I have prepared some statistics on the subject of rice culture in the State of South Carolina in order to present the matter properly to your Commission. The figures in the tables which I present have been taken from the annual report of the Secretary of the Treasury and from the report of the Chief of the Bureau of Statistics for the year ended June

30, 1881, which are the latest data I have been able to obtain. They are as follows:

STATISTICS OF TRADE IN FOREIGN RICE.

[Condensed from the Annual Report of the Secretary of the Treasury on the Commerce and Navigation of the United States, fiscal year 1880-'81. Report of Chief of Statistics for year ending June 30, 1881.]

By Commissioner BOTELER :

Question. You speak of an increase of the duty on rice. To what extent would you recommend an increase?—Answer. I am not prepared to recommend an increase of the duty at all. I prefer, and I think nearly all who are interested in the culture of rice in this State prefer, that the duty, whatever it may be, should be a fixed one. They would rather have it fixed and lasting than to have it increased for a time. If a higher rate is put upon rice, there is greater danger of change in the future. I think the best interests of the rice-producing class in our country would be subserved if the duty at present established could be maintained for a term of years.

By the PRESIDENT :

Q. Then you ask for the present duty on protective grounds?—A. I ask for it on the ground previously stated; which is, that as long as the policy of the country is a protective one, we should derive our just share of that protection. I myself am in favor of free trade.

By Commissioner OLIVER :

Q. Except on rice?—A. No, sir; I am willing to give up the duty on rice for free trade. But as long as the policy of the country is protective, I think we can show that rice should be protected. The principal ground on which the policy of protection is based, as I understand, is because of the increased wages paid for labor in this country. That is not only claimed by the protectionists everywhere, but it is conceded by the anti-protectionists, while they claim again that the increase of wages is on account of the increased cost of living to the laborer. But all parties, I think, will admit that a protective policy does raise the scale of wages. There is hardly any article produced, certainly none in this part of the country, where the wages of labor paid out in the course of production form so large a percentage of the total cost of production as is the case in rice culture. Nearly the whole cost of production is in labor. Some gentlemen who have had a great deal of experience in this matter, after investigating it very thoroughly, have

come to the conclusion that it costs 90 cents per bushel, for the item of wages alone, in the production of rice, and at the present prices the average value of it is about \$1.25 a bushel. So that you have very nearly three-fourths, or 75 per cent., of the cost of rice in labor. If a protective policy does really, as is claimed, raise the price of labor all over the country, then the only opportunity for the rice people to get back their contribution to labor in that form is by the protection which they get from this present duty.

Q. It was stated to us yesterday at Savannah that the rice you are compelled to compete with is produced by laborers receiving only 8 to 12 cents a day wages; that statement has been made to the Commission. If we recommend that the duty be taken off rice and other articles, and we have free trade, do you think it is possible in your life-time, or in this generation, to reduce the price of labor to a point so that you can successfully compete with this Asiatic labor?—A. But, in addition to the cost of Asiatic labor, you have the cost of importation, the risk of a long voyage, and charges of freight and insurance to pay, which in itself is some protection.

Q. But you have just stated to us that 75 per cent. of the cost of cultivating rice is in labor. I want to know whether it would be possible to reduce the price of labor here to anything like the price of the labor which produces this foreign rice?—A. No, sir; I do not think we shall ever see labor in this country as poorly paid as it is in the East Indies, under any circumstances.

By Commissioner BOTELER:

Q. You state that a reduction of the duty would compel the abandonment of the rice fields?—A. Yes, sir.

Q. On what ground—that the foreign rice would take its place?—A. Yes, sir.

Q. Then, if the duty was wholly taken off, it would certainly cause the entire abandonment of this industry in our country?—A. Yes, sir; as things are at present.

Q. And we should be entirely dependent on the foreign market for that product?—A. Yes, sir.

Q. Is there any assurance that if that were the case the price would not be enhanced?—A. It would very likely be enhanced, because during the Confederate war, when there was no American rice in the market, the price of rice was very much higher than it is now.

Q. So that the consumer would be obliged to pay a higher price for that essential article of food?—A. Very probably. I have a letter here from a large rice planter, which covers the very point to which you refer, which I will read.

ANNANDALE PLANTATION, *September 21, 1882.*

[Extract.]

The future of rice planting depends entirely upon the protection given to us by the government. Once it is settled that we are to be protected and the Hawaiian Islands are not to be made ports of entry for India rice, and from thence enter this country upon conditions that make it a formidable competitor with our grain, you will see the rice industry take a new lease of life; and although an increase of acreage (and hence a greater amount of grain placed on the market) will depress prices, it will not effect us, because it will be grown at the same cost that we

have to grow it, and the expense of cultivation will be regulated accordingly. What we can't contend with is the cultivation of rice in this country at high wages, as compared to the cheap labor in foreign countries. South Carolina planters will always grow rice as cheaply as the planters of Georgia, North Carolina, or Louisiana. If we cannot, then we will be driven out of the market in a fair and legitimate manner, because we are growing our grain with similar paid labor. But we insist that we cannot, under our expensive system of embankments, and drainage, and irrigation, cope with foreign rice. I am satisfied, unless protection is given to us, that our rice industry will not survive five years after the duty is taken off; and the past proves what will take place when the government drives us out of the market. When we were out and foreign rice had full control, rice ranged at about 13 cents per pound; since we have been in, we have kept it at from 5 cents to 8 cents per pound.

WM. M. HAZZARD.

By the PRESIDENT:

Q. You have stated that rice is a necessity in time of war. Will you please state your views upon that subject more fully.—A. Rice always has been one of the established rations of all armies, as far as I have been able to ascertain. I remember hearing years ago that the English Government always had a large stock of rice stored at Gibraltar, which they kept up to a certain quantity. Whenever it became old they would sell it and lay in a new stock; and in that way they always kept a very large stock of rice on hand in good condition, because it was considered as an essential part of the rations of soldiers and sailors in time of war. Rice contains more nutriment in proportion to its weight than anything a soldier can carry, and on long marches, it is believed, a soldier can transport his provisions better, and for a longer time, in the form of rice than in any other form.

Q. Is it not also very essential for hospital uses?—A. Yes, sir; it is exceedingly useful. In times when cholera is raging it is universally consumed as a specific, and is everywhere conceded to be very healthful as food for troops in camp.

J. B. BISSELL.

CHARLESTON, S. C., *September 26, 1882.*

Mr. J. B. BISSELL, of Charleston, S. C., addressed the Commission as follows:

I have no detailed statement to make upon the subject of rice, but I will say one thing, and that is, that if the present duty should be taken off rice it would ruin that industry entirely, in my opinion. Two years ago I purchased a rice plantation for which I paid \$24,000, and if I thought the duty on rice was to be removed I would be very glad to sell it for \$5,000. I do not care to make any statement upon the subject, as it has been already so fully presented by Mr. Trenholm, Mr. Jervy, and others; but if any members of the Commission desire to address me, I shall be happy to respond.

By Commissioner BOTELER:

Question: What suggestions have you to make in regard to the present rate of duty? Do you regard it as a sufficient protection?—Answer. In my opinion it would be best that the present duty should remain as it is. If we could be assured that the duty would remain unchanged for some time to come, it would encourage us in the cultivation of that product very much. Every once in a while we hear it said that the duty on rice is going to be taken off, and we are always apprehensive that something will be done by Congress in that direction. I do not know what use could be made of our lands if the duty was taken off rice and its cultivation stopped. In Louisiana, where the land is virgin land and has not been subject to cultivation, they "broadcast" their rice and are able to raise it cheaper than we can. We have to be at work all the time raising our banks and fixing our trunks so as to be prepared in case of a gale or freshet, and we are at much more expense, and it costs much more to raise rice here than it does in Louisiana. Besides, they can use machinery to some extent, while we are compelled to work lands where machinery cannot be used at all.

Q. It requires more hand-labor in South Carolina than it does there?—A. Yes, sir, it does; and we raise much less rice in proportion to the acre. I suppose the Louisiana rice-growers' average product, however, will decrease after the land has been cultivated for a few years. After the war we commenced planting, and the negroes worked for me at that time for about 40 cents a day, and it was very seldom the case among the hundreds of hands whom I employed that they took anything but corn in payment for their labor. But that has all changed. Now they demand \$1 a day for wages, and generally finish their day's work about 12 o'clock noon. Most of them have cows and horses, and are getting along nicely. They buy land adjoining the rice plantations and have their little homes, and come in and work for us and go back to their houses, and are in a better condition than they were before the war. But if you take off the duty on rice we should not be able to employ them at all, and I think our plantations, with the exception of a very few, would be abandoned.

Q. Could not the land be applied to other uses?—A. I think not. I have tried this year to raise oats and grasses, and I have not made it a success. The land is too soggy, and does not produce the right kind

of grasses. It does not seem to produce anything to advantage except rice. I tried a little of it in sugar cane, but could not cultivate that successfully. Last week I was working upwards of 800 hands, and I suppose each hand has four or five people dependent on his labor; so that would make 4,000 or 5,000 people dependent on this labor that is necessary for the cultivation of rice on my own plantation.

By Commissioner OLIVER:

Q. It has been suggested that if the duties on all articles were decreased 25 to 33 per cent., everything would be cheaper in this country. In that view, could rice stand a proportionate decrease on the tariff list with all other articles? Do you think it could stand a reduction of one-half a cent a pound?—A. I do not think so; I would rather see it increased to 3 cents, although I think it would be best for it to remain at 2½ cents. It is a struggle now to make a living in the cultivation of rice. After the war, rice sold as high as 13 cents a pound; but now we are getting only a little over 5 cents, between 5 and 6 cents a pound. The price is gradually decreasing. We are not making so much as we were directly after the war. To reclaim these rice plantations that were abandoned during the war costs about \$40 to \$50 an acre; but, as we have reclaimed so much since the war, of course the cost in the future will not be as great, unless we take in new lands.

Q. We were told at Savannah that in the cultivation of rice no agricultural machinery could be used.—A. That is true. The only machine that can be used is in the sowing of rice; nothing in harvesting at all.

Q. Then your rice is almost entirely the product of labor alone?—A. Yes, sir; almost wholly the product of labor. I do not think the cost of cultivation can be less than 90 cents a bushel. We cannot use machinery in connection with it, as can be done in the cultivation of oats, for instance.

SAMUEL Y. TUPPER.

CHARLESTON, S. C., *September 26, 1882.*

Mr. SAMUEL Y. TUPPER, president of the Chamber of Commerce of Charleston, S. C., addressed the Commission as follows:

I presume, Mr. President and gentlemen, that the purpose of your Commission is to ascertain how far the burdens and benefits of our tariff affect the industrial interests of our State, and what changes in the contemplated revision of the tariff will best advance the present growing industries of South Carolina. We are all aware that the country must have a tariff for revenue—some method for raising money to pay the expenses of the public service. There is no such thing in a great commercial country like this as free trade. I regard the doctrine of free trade as an absurdity; as a misnomer. Yet we know that leading men throughout our country have proclaimed themselves to be free-traders *per se*. Now, if I might venture to express the sentiments of this chamber, and of our commercial community, on this subject, I would say that, while we are in favor of a tariff for revenue, we desire that the industries of our country shall be protected to the extent of that revenue. For myself I can speak more freely. I would not advocate a tariff for revenue only, nor for protection only; but I would favor a tariff that would give the requisite amount of revenue to the country for all its wants and requirements, and to the extent of that revenue, and incidentally, protect American manufacturers and agriculturists. I believe that is the true doctrine for this country. I would go further. I am enough of an American to say that I think the shipping interests of this country should be protected, even to the amount of reasonable subsidies to ship-builders. I take it that what we want in South Carolina is a reasonable and incidental protection to our manufactories, which are now growing in the State, and to our agricultural interests.

The rice culture of South Carolina is a vital and important interest to us. All along our seaboard the most of our farmers and planters derive their subsistence from the culture of that article. Not long ago the cultivation of rice was second in importance only to the cultivation of cotton in its value, and now I believe it gives support to 50,000 laborers at least. We have also cotton factories growing up all over the State, and we manufacture bagging to a large extent. We are producing phosphate fertilizers, and manufacturing them, so that it is becoming a growing interest to us. I have no doubt that gentlemen who are present will represent that interest to you, and indicate what degree of encouragement they require. Others may, perhaps, desire some articles placed upon the free list, which they find essential to their manufacture. They will also represent their interests. My remarks are intended only as introductory.

By Commissioner BOTELER:

Question. Have you any specific recommendation to make in regard to the duty on rice?—Answer. No, sir, I have not; but there are gentlemen here who represent that interest, and the Commission will doubtless hear from them.

By Commissioner OLIVER :

Q. What would you recommend in regard to the present duty on rice ?—A. I am decidedly in favor of keeping the duty at $2\frac{1}{2}$ cents a pound; but it is so important an interest to us that I would be glad to see it increased to 3 cents a pound.

Q. You would be willing to join in the recommendation of the Savannah Board of Trade that it should be put at 3 cents a pound?—A. If the gentlemen who represent that interest are willing to recommend 3 cents a pound duty on rice, I would cheerfully advocate it.

E. WILLIS.

CHARLESTON, S. C., *September 26, 1882.*

Mr. E. WILLIS, of Charleston, S. C., addressed the Commission as follows:

The developing of the phosphate deposits of this State is a large and growing industry. There are about \$10,000,000 invested in mining it. The phosphate land proper is in a belt extending about 60 miles in length, and about 28 in width. It is found in almost all the rivers in the vicinity of Charleston, and from 12 to 13 miles north and east of the city. There are manufactured in this city about 50,000 tons annually of the crude phosphate rock. We make about 100,000,000 tons of fertilizer annually, and the entire product of the State is about 350,000 tons. It is one of the growing, prosperous industries of the State, and gives employment to a great many people. The river deposits belong to the State, and it exacts from the miners \$1 a ton royalty, receiving from that source alone about 25 per cent. of the entire revenues of the State. It is shipped all over the globe to distant countries.

By Commissioner PORTER:

Question. The largest portion of it is exported?—Answer. Yes, sir. Baltimore, Philadelphia, and Boston are very large consumers of the crude rock fertilizers, and large quantities also are shipped to England.

By Commissioner BOTELER:

Q. On chemical analysis how does your crude rock compare with that of other countries?—A. Its analysis is about an average. It analyzes from 55 to 62 or 63. It compares very favorably and it has a great many advantages that the other phosphates have not. It dries readily when treated with acids.

Q. You can maintain yourselves, then, against foreign competition?—A. Yes, sir.

Q. Your geographical location affords sufficient protection?—A. Yes, sir; by its use cotton culture in this section of the country has been carried to the foot of the mountains, and to-day, I suppose, in North Carolina, Georgia, South Carolina, Tennessee, and Alabama, cotton is made at the foot of the mountains by the use of fertilizers, where it has an advantage of from three weeks to a month over other parts of the country, which enables them to produce cotton and pick it before the frost comes. The best cotton we get here and in Savannah comes from those sections where they use the fertilizer.

By the PRESIDENT:

Q. How do these fertilizers compare with the Peruvian guano in their effect upon the soils?—A. They are much better, because the results are more permanent. Guano will burn the lands up and in time make them useless; it heats them too much. This is a cooler fertilizer, and its beneficial effects can be seen for years; while the effect of Peruvian guano is exhausted in a single season.

Q. Is the natural supply of these phosphates inexhaustible?—A. I should suppose it was if you take all the phosphates in the State, but if you take only the accessible phosphates it is not—that is, those phosphates which it will pay to mine; they are not inexhaustible. It will not pay at the present price of phosphate rock to mine more than 6 feet

in depth. In rivers it does not make any difference. We manage with machinery to raise the phosphates with the old mud-digging dredges, and obtain it in paying quantities.

Q. These phosphates, I understand, are treated with sulphuric acid?

—A. Yes, sir; they are ground and treated with sulphuric acid.

By Commissioner OLIVER :

Q. You have no recommendation to make; you are satisfied with the duties as they are?—A. Yes, sir; I do not think we require any protection at all.

In conclusion I submit tables showing the business done here and in adjacent ports in connection with the shipment of these fertilizers:

T. D. JERVEY.

CHARLESTON, S. C., *September 26, 1882.*

Mr. THEODORE D. JERVEY, of the firm of W. C. Bee & Co., commission merchants, of Charleston, S. C., made the following statement:

Those who are interested in the cultivation of rice respectfully submit, in favor of the retention of the duty on foreign rice, the following remarks:

The lands which are adapted to the cultivation of rice were originally reclaimed from the rivers by a very costly system of embankments and flood gates, &c. At the termination of the late war these lands, having been abandoned for four years, were in a ruinous state—banks washed away, with large crevasses, the flood gates destroyed, and canals filled up. In many instances the thrashing mills, barns, &c., had been destroyed by fire, and these formerly valuable lands were nearly reduced to their normal condition.

At the average value of the product of these lands prior to the war, no effort could have been successfully made to bring them into cultivation, and they must have become valueless.

The duty which had been imposed by Congress upon foreign, enhanced, as a matter of course, the value of domestic, rice, and warranted the effort of bringing these lands again into cultivation.

Upon the mortgage of their property at enormous rates of interest, say 18 to 30 per cent. per annum, the owners commenced the work of restoring these lands.

From a crop of 12,500 tierces, as the product of Georgia and South Carolina in 1865-'66, these States sent to market in 1880-'81 near 100,000 tierces rice, and but for the exceptional bad season and heavy gale of last year a still larger crop would have been marketed.

Stimulated by the remunerating prices current, the planters of Louisiana and North Carolina also entered more largely into the cultivation of rice, and the entire crop is now about 200,000 tierces in all, representing a fixed and floating capital in these States of upwards of \$10,000,000, and giving support to about 200,000 people.

The relative cost of cultivation now and before the war is very great. At the latter period, if a planter had the misfortune to have his banks broken his neighbors immediately came to his assistance with all their laborers, animals, and utensils, and speedily repaired the damage at no expense to the sufferer, and with but little injury to the crop; now, under the same circumstances, much time is wasted, and the crop is sure to be badly injured by the delay, and the planter has to pay out cash for everything, in addition to labor at enhanced rates; the relative scarcity of labor also makes the cost of planting much heavier than formerly, short time and bad work making the yield much less than before the war, and making it almost impossible to contend against imported rice from the Hawaiian Islands and other countries where labor is so much cheaper than with us. Should the duty be repealed, or even reduced, the work of the past sixteen years would be thrown away and millions of property would be sacrificed, and over two hundred thousand of our population, white and black, would have to look to other sources for support, as, on account of the peculiar character of these lands, they

are adapted to the cultivation of no other paying crop. As a proof that the present duty is not excessive, though it has enabled many to restore their lands to some degree of value, there are still about two-thirds of the lands in this State which were planted before the war lying uncultivated and neglected.

The removal of the duty having the effect of destroying the interest here, would leave the consumer entirely at the mercy of the foreign producer who would have a monopoly of the article, and for which he would probably secure prices even above those ruling at present.

By Commissioner GARLAND :

Question. I understand that you recommend a retention of the present duty on rice?—Answer. Yes, sir; it is absolutely necessary to the successful carrying on of the cultivation of that article in Georgia and this State.

Q. Have you noticed the representations made to the Commission yesterday by the rice-growing interest of Savannah?—A. Yes, sir.

Q. They recommend that the duty on rice should be advanced to 3 cents a pound.—A. I should be glad to have that advance made; but what we chiefly want is a certainty. We want to know whether we can depend upon the present duty for any length of time.

Q. What I want to ascertain is whether you consider an advance necessary, or only desirable?—A. I think it is desirable, but not necessary.

By Commissioner OLIVER :

Q. If the people of this section were assured of a fixed rate of duty on rice for ten years, what would be the result?—A. I think there would be a larger area of land planted in rice.

Q. Have you any idea what the probable increase would be in the product?—A. I think if the duty was a fixed one for a series of years it would be of very great advantage; but I could not estimate what the probable increase would be. If the duty were taken off, all these lands would have to be abandoned. After the war the price of rice rose to 10 or 12 cents a pound, and now it is down to 5 or 6 cents a pound.

Q. But is it not about the same price relatively compared with that period when gold was \$1.50 or \$2 premium?—A. I think not. I do not think the premium on gold just after the war was over 50 per cent.

By Commissioner BOTELER :

Q. What would be the effect on the producer if the suggestions made to us yesterday to increase the duty from $2\frac{1}{2}$ to 3 cents should be adopted; would it stimulate the production?—A. Yes, sir; I think it would make the article cheaper, because a good many of these lands—upwards of two-thirds of the lands in South Carolina formerly planted in rice—are lying waste now; but if the prices were to increase, the larger portion of those lands would be put under cultivation.

Q. A larger area would be brought into cultivation, a greater product would result, and the consequence would be, you think, a reduction of the price to the consumer?—A. Yes, sir; I think we should be able to supply the whole of the demand. There would be no necessity for importing the foreign article, and the rice producer would do as well as he is doing at present. Every year they are enabled to decrease the cost of production by getting their lands in better order.

Q. But you desire stability chiefly?—A. Yes, sir; to know what we can look forward to for a series of years.

By Commissioner OLIVER :

Q. Have there been any cargoes of foreign rice imported into Charleston?—A. No, sir. It all goes to New York or San Francisco.

Q. We were told that Rangoon rice comes into Savannah.—A. Yes, sir; they receive it from New York. None comes there direct, to my knowledge.

Q. Do they bring that Rangoon rice for the purpose of mixing it with the native product?—A. Yes; that is done by the retailers; but it is not done by those who handle rice in the first instance. When Carolina rice is relatively higher than the other they are apt to mix it.

By the PRESIDENT :

Q. The interests of the consumers have to be looked after as well as the interests of the producers in this matter. In that view, let me inquire whether the people of this State are large consumers of rice?—A. Oh, yes, sir; you will find a dish of rice on almost every table in the State.

Q. Is it consumed largely by the colored people?—A. Yes, sir; they are very fond of it, and prefer it to hominy or grits made from corn.

Q. Would a reduction of the present duty be acceptable to the consumers?—A. If you were to take off the duty a large number who are planting rice would be compelled to abandon its culture; they could not borrow the money to carry on its cultivation, and in that case foreign rice would be introduced in large quantities, and, according to my experience as a merchant, the price would rise. The culture would be abandoned here for a time, and the land would get into the same condition it was in after the war, requiring a large expenditure before it could be put back into its present condition.

Q. As a merchant, then, you do not think that the consumers would be benefited by a reduction of the duty on rice?—A. No, sir; I do not think they would.

D. L. RUSSELL ET AL.

WILMINGTON, N. C., *September 27, 1882.*

Mr. D. L. RUSSELL, representing the rice-growing interest, addressed the Commission as follows:

A committee of three gentlemen (of whom I am one) has been appointed to prepare a written statement containing some statistics and facts with reference to these two interests. Outside of the particular interests whose existence is at stake in this section, there is a growing sentiment here in favor of the protection policy. So far as I am concerned I have no hesitation in saying that I have always been and am for protection first and for revenue afterwards. I do not think, however, that any duty should be so high as to be prohibitory, unless as to some particular interest that ought to be developed—and I do not know of any such. We have in this section of North Carolina but two interests (or rather three) that are important—the lowland rice, the upland rice, and the peanut. The lowland rice, about which you have heard so much in the South, is cultivated, to a great extent, in the valley of this (Cape Fear) river. Previous to the war the production on this river and in the region tributary to this town was from 200,000 to 250,000 bushels. These lands are being reclaimed and cultivated with some profit. The prices of labor are high—laborers in these rice-fields receiving about a dollar a day.

The cultivation of upland rice is a matter of great importance in this section of the State. Indeed, it pays better than any other cereal that can be planted.

The peanut is another important interest. It is a product that is adapted to a certain character of soil that abounds in this region, and that is unfit for other purposes.

By Commissioner OLIVER:

Question. Is there any difference in quality between upland rice and lowland rice?—Answer. There is a difference in price of from 30 to 40 cents a bushel. The upland rice is that much cheaper.

Q. And that is the reason why it is not produced more largely?—A. Formerly it was unknown in the market. No upland rice was sold until within the last ten or twelve years. Now there is a rice-mill at Goldsboro and one or two at other points, mainly for milling upland rice. All through this country every small farmer has got a patch of upland rice, which he ploughs like any other crop, and which may be cultivated almost entirely with machinery, as it eventually will be. He consumes a little of it, but he sells the bulk of it. My impression is that the cultivation of it is increasing, and that it has come here to stay. Last year it was a failure, on account of a dry August, but that is about the only failure I have observed in it in ten or twelve years. I have seen this year some fields of 15 and 20 acres, producing 30, 40, or 50 bushels to the acre.

By Commissioner BOTTLER:

Q. How does it compare in quality with the lowland rice?—A. It is inferior. There is a difference in price of 30 or 40 cents to the bushel. It does not mill so high. Rice cannot be made to perfection without

water. It requires water culture. The Georgia rice-planters send here for their seed.

Q. How does it compare with the Sandwich Islands rice?—A. It is decidedly better than that. I do not think that the upland rice culture is temporary. I think it is permanent. There are millions of acres of land in this country that are better adapted to the cultivation of upland rice than of any other crop. It never can compete in quality or price with the river rice. But neither of these interests can flourish without protection for the present.

The history of the prices of rice, as connected with the tariff, proves what (protectionists contend) has been established in regard to other industries; and that is, that while protection may make the article dearer for a time, it ultimately cheapens it; so that it is a benefit both to producer and consumer. The statistics in the case of rice show that when foreigners got possession of the market (and even before the duty of 2½ cents a pound was put on) they put the price up to 12 and 15 cents a pound. The removal of the duty now would operate to give the foreigner the monopoly of the rice market.

Mr. DONALD MACRAE addressed the Commission as follows:

The cultivation of rice, which was almost entirely abandoned during and just after the war, has been slow in recovering in consequence of the very heavy cost of reclaiming the long-neglected fields and repairing the worn dikes and water trunks; and planters cannot compete successfully against the cheaper labor of India and China without reasonable protection, without which large areas of our most fertile lands would be abandoned and lie idle, being too low and wet for other crops, and large numbers, especially of our colored laborers, would be deprived of employment and homes. Even under the existing tariff our local crop is only about 50 per cent. of what it was before the war, and foreign rice is sold largely in our midst, and should its cultivation be abandoned by the South for lack of protection the prices of the foreign article would surely be advanced beyond the present cost of the superior quality produced by us, as was the case just after the war.

The 10 per cent. ad valorem duty at present imposed will cease after the 1st of January next, instead of which we consider it essential that it should be continued, if not increased. And a reasonable duty should also be imposed upon "ground and granulated rice," which is now imported largely and admitted free of duty to the serious injury of our home agricultural interests.

In our opinion, any reduction of the existing duty would be fatal to the rice production of the entire South, as it is subject to many risks from storms and freshets, and the cost of labor is much higher than on upland crops.

Only about half of our rice lands here are in cultivation. Not an acre of new lands for rice has been cleared since the war. The general estimate of the cost of clearing rice lands is \$100 per acre. These lands are heavily timbered, and it is very heavy work to clear them and drain them and ditch them. When they have been left standing for any length of time it costs from \$12 to \$20 an acre to reclaim them.

We think that our claim for protection against the cheap labor of China and India is as valid as the claim of California against Chinamen being introduced into this country.

By Commissioner OLIVER :

Question. How far north of Wilmington is the limit of land for the profitable production of rice?—Answer. There is very little cultivated north of this along the river. Probably 10 or 15 miles above here is as far north as any lowland rice is cultivated.

Mr. D. L. RUSSELL. The cultivation of upland rice is coextensive with the cotton belt.

The WITNESS. I am inclined to differ with Mr. Russell as to upland rice. I think that the reign of the cultivation of upland rice will be brief, because (from all that the planters say) it is one of the most exhausting crops that can be planted, and it will not be very long before the lands will be exhausted and farmers will be compelled either to wait for their recuperation or to plant them with some other crops. I know that for a year or two years any good upland will produce good upland rice, but after that they must get fresh land; and before long they will find that they are "paying too dear for their whistle."

By Commissioner BOTELER:

Q. Cannot the lands be kept in good heart by the application of mineral manures?—A. I do not think that the farmers have yet succeeded in that. Rice takes up elements from the soil that it is very difficult to supply with mineral manures. For lowland rice we have experimented very considerably with mineral manures, but we cannot say that anything is so good as the application of good phosphates with the sedimentary deposits from the uplands and the mountains. The effect of artificial fertilizers, or even of Peruvian guano, is scarcely perceptible, because it is so easily "leached out" by the flooding of the fields.

Q. You think that the reduction of the duty on rice would be disastrous to the rice planter?—A. That is our idea.

Q. Have you any recommendation to make in reference to the duty?—A. I do not know that we have. I think that the planters here generally would be satisfied to have the duty remain as it is. I do not think that they desire any increase of duty; but they want to know that there is going to be some steadiness about it. It would not pay them to go to the expense of reclaiming their lands if free trade in rice is to be reached; so far, it has never been demonstrated that there is any other use to which the rice lands can be put, and yet they are the most fertile lands that we have in our country.

Q. You think that the rice planters would be satisfied with the present duties?—A. I think so.

Q. And that if there was an assurance of permanency in these rates, the cultivation of rice would be extended?—A. Yes.

Q. And that the consumers would be benefited by the competition?—A. I think so.

Mr. D. L. RUSSELL. I do not think that the argument in favor of lowland rice is weakened by the fact that the upland rice culture is permanent. The greater the interests the greater the necessity for their protection. There are a larger number of persons engaged in the culture of upland rice in this State than of lowland rice. I have no doubt that there are ten times as many.

The WITNESS. In the cultivation of lowland rice we have to pay a dollar a day for labor, and sometimes, in the harvesting season, more than that. In the cultivation of upland rice labor can be obtained at from \$8 to \$10 a month; and if it is demonstrated that we can raise all the rice needed on the uplands at much less cost than it can be raised on the lowlands, then we are independent of China and Japan.

Mr. RUSSELL. But we cannot do that.

The WITNESS. And the success in the cultivation of upland rice is only temporary in my judgment. I may be wrong; I am only speaking of what I have heard from the upland rice planters.

Mr. RUSSELL. Still the duty on both kinds should be the same.

The WITNESS. It would be agreeable to us to have it the same, but the necessity of it is not apparent to me.

Mr. S. L. FREMONT said:

I concur with what has been said on the subject of rice. I commenced its cultivation three years ago. I do not think that the revival of the rice culture here would have been undertaken if it had not been for the duty. It had been recommenced directly after the war, but as a general thing it failed. The labor system then was not so good as it is now. That was not the reason, perhaps; but the thing was abandoned, and it was some time before it was realized that rice was bringing a sufficiently high price to justify its cultivation. A great many persons thought it a wild project. If any agricultural interest in the world is entitled to protection it is rice culture. The rice planter pays 33 per cent. more for labor than any other farmer does; and at the same time his crop is brought in competition with the rice produced with the cheapest labor in the world. For these two reasons, the American rice planter is entitled to protection, and because the home supply has not yet reached the home demand.

I learn from recent correspondence that the American seed-rice is being carried to China for the purpose of producing a better quality of rice, which will soon be in competition with our rice. That of the Sandwich Islands is so already.

For this reason the protection on rice is important if we are to maintain our position as rice planters. I speak now of the tide-water rice in the Carolinas, Georgia, and Louisiana. As to the upland rice, I have no information about it; but my impression has been, from what I have seen and heard, that the upland rice is not to be a permanent crop, for the reason which Mr. MacRae has stated, that it exhausts the land, and the farmers find it more profitable to cultivate something else. On lands that are habitually wet, rice may be cultivated with success; but I do not think it can be on uplands. I believe that the time will come when, by the introduction of machinery, rice can be cultivated much cheaper than at present; and if, in the future, Congress chooses to reduce the duty on rice, the American rice planters may be able to bear it; but at present it would be ruinous. And a benign government should not throw out of employment a quarter million of manumitted slaves who are only well fitted to cultivate rice lands. If the rice lands be abandoned that will be the result. They are specially adapted to that culture. That is a question of morals which should be considered by the government. The rice planters pay 75 cents to a dollar a day for labor, while the farmer on the high lands pays 50 cents. When you compare those wages with the 7 or 8 cents a day paid in Asia, you will see how hard it is for the American rice planter to compete with the Asiatic. The introduction of American seed-rice into China, the risks incurred from storms, the high price of labor here, and the cheap and abundant labor of Asia, all seem to be sufficient reasons to justify the protection of American rice.

Should we not have a home protection for our rice, so as to make us independent of foreign rice in case of war, when rice is almost an indispensable article of food for armies and of hospital supplies? That is one reason for protection. Another reason is, that if we increase our home product we will prevent a monopoly of the foreign market, while the foreign rice will prevent a monopoly of ours. In other words, monopoly on either side is prevented by the maintenance of the present duty. If we can only maintain the present supply we are doing a good deal. If the import duty be removed and our production fails, of course the foreign rice will come in and have a monopoly of the market. That is one reason why it is the interest of the American people at large to maintain their own rice-fields. Our weak point before Congress is that, as the rice culture is confined to four States, Georgia, Louisiana, and the Carolinas, we have but little influence in favor of a protective duty, except that general idea of protection, which we hope that all feel justified in giving us. We should prevent a monopoly and make ourselves independent of other nations by producing rice ourselves.

By Commissioner OLIVER :

Question. Are you a planter?—Answer. Yes; I am planting rice.

Q. Outside of the matter of rice, what is the feeling among the people in regard to reducing the tariff materially, or to making great changes in the duties on imports?—A. It is here about as it is in other parts of the country. The commercial interests are, to a certain extent, in favor of protection; and the farming interests, I suppose, are generally opposed to protection. Very few people understand the subject sufficiently well to discuss it intelligently; but so far as I know I do not think there is any great desire for any material change in the tariff. There are some articles, perhaps, that require a reduction of duty. Iron seems to be one of them. But I do not think the people at large care much about it. I do not think that the subject interests the people very much.

By Commissioner BOTELER :

Q. Are there any complaints about the tariff coming up from the farming community?—A. We do not hear anything about it from that source. The most that we hear about it is from Congress and from speakers on the stump. If you hear gentlemen discussing the question you will find that one is for free trade, another for protective duties, and another, perhaps, for a tariff for revenue with incidental protection. The latter, I think, is the popular side of the question (outside of special interests). We come here to advocate the maintenance of the duty on rice, and we cannot say that we want the duty taken off everything else but rice. Therefore we have to sustain the protectionist policy generally. That is the ground which I, at all events, take; and I believe it is the general ground. When the manufacturer of any article wants that article protected he is willing that the duty shall be taken off everything else, but he will not ask that that be done. We do not believe that we could stand alone. If the duty be taken off other agricultural products it would strike rice too, and we are only afraid that it may strike rice first.

By the PRESIDENT :

Q. Are you an old army officer?—A. Yes; I served twelve or fifteen years in the army after leaving West Point.

Q. And what you state as to rice being necessary in army supplies is a well-known fact?—A. Yes; rice is indispensable to an army to keep the troops healthy. It contains more nutriment in proportion to weight

than almost any other article of food. No other grain is equal to it. It is a part of the regular army rations, and is frequently issued as an extra ration.

An attempt is being made in North Carolina to raise silk. Cocoons are now imported free of duty, and it is thought if a tax were laid upon them the industry of raising them here would be increased very considerably. Around Raleigh they are planting mulberry trees and raising silk worms. I have a letter here in which the writer says that the industry would be encouraged very materially by a tax on cocoons, and that after a time we would be able to make our own silk. There is a great deal of light land in North Carolina that is adapted to the growth of the mulberry tree, and the climate is suitable to the hatching of the eggs and the growth of the worms.

By Commissioner GARLAND:

Q. Do you know what rate of duty is asked?—A. No, sir; I do not.

A statement was received from Mr. PEMBROKE JONES, of Wilmington, N. C., suggesting a duty of 20 per cent. ad valorem on rice flour, and saying:

About \$50,000 worth of rice flour is imported to this country under a duty of only 20 per cent. ad valorem, or one-fifth the duty now on clean rice. Rice flour is only clean rice pulverized, and it clearly seems to me that the duty should be the same as on the clean article. If this duty be imposed it will build up mills for the manufacture of flour, and thereby call for the employment of much capital and labor.

GEORGE Z. FRENCH.

WILMINGTON, N. C., *September 27, 1882.*

Mr. GEORGE Z. FRENCH, of Rocky Point, N. C., farmer, submitted the following statement in regard to peanuts:

I have been selected to represent the peanut growers of this section, and I respectfully submit the following facts:

The average annual production of peanuts in this section (those called "Wilmington" peanuts) is about 120,000 bushels. Up to 1861 the crop of this section, about the same in quantity as now, constituted seven-eighths of the entire crop of the United States; but under the fostering protection of the duty (one cent per pound), improved in 1865. This industry has increased so that now there are from 300,000 to 600,000 bushels raised annually in Tennessee, and from 700,000 to 1,000,000 bushels in Virginia. The price fluctuates, as large or small quantities of "African" peanuts are imported. For example, peanuts that sold in the Wilmington market in July last at \$1.70 per bushel, or 6 cents per pound, are at this date, owing to recent heavy importations, selling at \$1.40 per bushel, or 5 cents per pound. The peanut is raised principally by the smaller and poorer class of farmers, upon such soil as no other remunerative crop can be raised.

The discontinuance of the duty would undoubtedly put an end to their production in this section, and thereby impoverish many small farmers, whose lands would become entirely worthless.

It must be understood that the peanut is a luxury, being consumed altogether as a fruit, so that there can be no hardship to any class of people by the imposition of duties. We recommend that the duty on peanuts be increased to at least 2 cents per pound.

By Commissioner GARLAND:

Question. Is it not a fact that the culture of peanuts has been increasing lately?—Answer. Not in this section, but very much in the country generally. Since the duty was imposed on peanuts, their production has increased from 600 to 800 per cent.

Q. And it is your opinion that if the rate were increased the production would be still further increased?—A. I think so. The average price last year was only about 40 per cent. of what it was the year before. That falling off in price may be charged to importation. There are very many acres of land in this vicinity that cannot produce cotton or corn, but will produce peanuts.

Q. What is the average production per acre?—A. Not over 25 bushels to the acre. I have known from 50 to 60 bushels to the acre. On 200 acres I have made about 25 bushels to the acre, which I consider a good average production.

I will now speak on the subject of chalk, a specimen of which, found in the State, I submit for inspection.

Chalk is now on the free list. We have in Eastern North Carolina probably over a million of acres in which there are deposits of chalk, or of something as near to English chalk as anything on this side of the Atlantic. Whiting is made from chalk. Chalk is imported at about the cost of the freight. It is sold in New York at 1½ cents a pound, much less than we could freight it there from here.

By Commissioner PORTER :

Question. How much chalk is imported?—Answer. I have no idea; but all that is used for whiting is imported. There is little hope that anything will be done about it; but I thought it best perhaps to bring the matter to your attention. This chalk analyzes the same as English chalk—at from 90 to 92 per cent. carbonate of lime. The only use that it can be put to, outside of fertilizers, is the manufacture of whiting—a very large interest in Philadelphia and New York.

H. C. McQUEEN.

WILMINGTON, N. C., *September 27, 1882.*

Messrs. H. C. McQUEEN and ROBERT E. CALDER, representing the Board of Trade, submitted the following statistics as to the trade and commerce of Wilmington:

Stocks afloat and ashore, April 1, 1882.

Stock.	Ashore.	Afloat.	Total.	April 1, 1881.	April 1, 1880.	April 1, 1879.	April 1, 1878.

* Cotton from September 1; spirits, &c., April 1.

JOHN P. BRANCH.

RICHMOND, VA., *September 28, 1882.*

Mr. JOHN P. BRANCH, of Richmond, banker, addressed the Commission as follows:

Mr. PRESIDENT AND GENTLEMEN: I have no personal interest in the tariff. I have no ax to grind. And so, what I have to say will be very short and general. I have my own peculiar views as to the tariff question. I am in favor of a tariff for revenue. While our present revenue is far more than ample to meet all the requirements of the government, perhaps it would not be if the internal-revenue tax were abolished, which I am entirely in favor of. I think it is wicked in its inception; and the sooner we get rid of it the better. It was first started in order to tax the cotton of the South—the raw material. Except in the case of the taxing of raw and manufactured tobacco in Italy and France, I know of no instance where the raw material of a country is taxed by its own government.

I am satisfied that the tariff needs revision in many particulars. Take, for instance, the manufacture of locomotives. The demand for them is so great that it cannot be supplied. Orders have to be taken a year ahead. Their manufacturers in this country make immense profits. They have orders for them from other countries, because no other country makes them so good. So also as to the article of steel rails. Very large profits are made on them. At one time steel rails sold as high as \$125 a ton; and now they sell as low as \$47.

By Commissioner GARLAND:

Question. When steel rails were being sold at \$125, what was the duty?—Answer. \$28.

Q. What is it now?—A. I think the duty is the same now—\$28.

Commissioner OLIVER. American rails never sold so high as \$125. They were English rails. As soon as we commenced making them here the price went down rapidly.

The WITNESS. Precisely. That is what I was going to say. At that time the impression was that steel rails could not be made in this country. I refer to the year 1871-'72. Of course the manufacture of steel rails in this country has reduced the price. It is said that steel rails can be made as cheaply as iron rails, and I see no reason why a duty on steel rails should be any higher than on iron rails.

By Commissioner BOTELER:

Q. I see that the Baldwin Locomotive Works are sending locomotives to Australia. Why do not the Australians get the English locomotives?—A. I believe it is because the best locomotives are made in the United States.

Q. Then the duty does not have much influence?—A. We would like to have the opportunity of allowing people to buy locomotives wherever they choose. If they want to bring English locomotives here, let them do so.

Q. If they bring inferior locomotives here and undersell the American manufacturers of good materials and break down that manufacture, where would the benefit be?—A. I do not think that the American man-

ufacture of locomotives would be broken down. Everybody knows that locomotives can be manufactured at much less prices than the present rates.

Q. You know that more railroads have been built here this year than ever before?—A. Yes; and we would have built more if steel rails and locomotives had been cheaper. Railroads are built first, and population goes there afterward, as in the case of the Northern Pacific Railroad. But I will not quarrel with the tariff, for I think that, with very few exceptions, it is about as nearly right as it can be got. I should like to see our sumac business protected, although I cannot say that I am a protectionist. But what I want this Commission to do is to recommend the abolition of the internal-revenue system, and then the tariff can be arranged as the Commission thinks best. I think it wrong that we should be paying off our debt at the rate of \$150,000,000 a year. In the last two years we imported \$200,000,000 of specie. We had been exporting specie for certainly seventy-five years. But for the two and a half years preceding last February we had imported over \$200,000,000 of specie. The people of Europe cannot send us gold all the time. We are sending them three-fourths of our cotton crop every year, half of our petroleum, and half of our grain. What is to become of our producers if the people of Europe cease to take our cotton, petroleum, and grain? They would not be able to buy our own home-manufactured goods. The first thing you know, the people of Europe will be putting a tax on our cotton.

By Commissioner OLIVER:

Q. Do you think that we ought to buy their goods?—A. I do.

Q. Sumac, for instance?—A. I am not a protectionist; but, as a local thing, I would like to see these sumac gentlemen get all the protection that they want.

By Commissioner GARLAND:

Q. What duty would you recommend to be imposed on locomotives?—A. I would like to see the present duty reduced one-half. I do not think that our duties should be so high as to keep out English manufactured goods.

Q. Do you think that English locomotives would come in here at any price?—A. I think that some would.

WILLIAM N. JONES.

RICHMOND, VA., *September 28, 1882.*

MR. WILLIAM N. JONES, of Petersburg, Va., secretary of the Sumac Manufacturing Association of Virginia, made an argument in favor of an increase of the duty on sumac from 10 per cent. ad valorem to \$20 per ton of all grades. He said:

The duty on sumac was imposed during the late war, when Sicily sumac was worth \$200 per ton; now it is only worth \$65 to \$70 per ton. The importation of large quantities is now destroying the manufacture of domestic sumac, and will throw out of employment in the gathering season at least 100,000 people for three months, consisting of women, children, old men, and laborevs unemployed otherwise. A large number of men are employed steadily in manufacturing sumac. The low price of foreign sumac has so reduced the price of manufactured that one-half of the firms engaged in manufacturing have either failed or gone out of the business during the past twelve months. Unless some protection is given the business will be killed out. The business at its best has produced a revenue to this country of \$500,000, and would produce, if protected, \$1,500,000.

By Commissioner OLIVER:

Question. What was the price of sumac when the duty of 10 per cent. was put on?—Answer. Up to the war there was no domestic sumac manufactured. The price of the foreign article was \$140 or \$150 per ton.

Q. Then the duty of 10 per cent. would be \$15 a ton?—A. Yes.

Q. What is the price of sumac now?—A. \$65 per ton for the best foreign sumac. It has been invoiced as low as \$25.

Q. Then the existing duty of 10 per cent. is only \$2.50 a ton?—A. Yes.

Q. And you ask for eight times as much?—A. We want a specific duty of \$20 a ton.

By Commissioner BOTELER:

Q. Please give us an idea of the number of persons employed in the collection of sumac.—A. During the season there are employed, perhaps, in collecting and manufacturing sumac some 250,000 or 300,000 persons in this State for two or three months.

Q. And mainly those who have little or no other means of support?—A. Yes. The work comes at a time when the crops are laid by. The gathering of the leaves is a very simple operation, and is done by women and children and old men. They gather the sumac and take it to the country store, and from there it is shipped to market. The supply has been greater than the demand; and consequently the price was reduced, until half the sumac mills have gone out of the business.

By the PRESIDENT:

Q. Please describe the process of manufacturing.—A. The sumac comes to us sometimes in car-load lots. We take the leaves, pack them in warehouses, turn them frequently, and get them in order for grinding. Then we store them back in warehouses for three months or more. Then the leaves are taken to the mills and ground. Then the flour is passed through a sieve, and all dirt and foreign matter taken out. Then

it is passed over a fan, and then it goes under what we call "chasers"—very heavy rollers. Then it is turned off into a fine bolt, and when it is bolted it is as fine as flour. There is a loss of about 33 $\frac{1}{4}$ per cent. in cleansing sumac of its stems and roots, and a loss of 10 per cent. or more in the drying of the leaves; so that you perceive that when we sell sumac in Boston at \$42.50 per ton of 2,240 pounds, and at four months' credit, we have very little profit.

Q. How many sumac factories are there in this State?—A. There have been as many as twenty-five, but there are now only thirteen or fourteen. The rest have gone out of business; and the consequence is that not more than half of the stock will be gathered this year.

Q. You ask that the duty be increased to \$20 a ton?—A. Yes.

Q. If the present duty were removed, you think that the industry would be destroyed?—A. Yes.

Q. And the people who depend very largely on the gathering of sumac would be sufferers?—A. Yes.

Q. Do you believe that the sumac can be cultivated, and can be improved by cultivation?—A. There is no question about that.

Q. It now grows wild?—A. Yes.

Q. And your proposition is to plant it in improved varieties?—A. Yes.

Q. And to have it as a regular agricultural crop?—A. Yes. It now brings to the State \$1,300,000 a year; and there is no reason in the world why North Carolina and other contiguous States should not cultivate it. There is something in our soil and climate which gives us the advantage over other places.

Q. Have experiments been made in the cultivation of sumac?—A. In a small way. A gentleman living in Petersburg tried it, and found the quality very greatly improved. But he could not pay the cost of labor here and make money out of it, and so of course he abandoned it.

By Commissioner GARLAND:

Q. How long has this industry been pursued here?—A. It commenced immediately after the war.

Q. The duty then was 10 per cent.?—A. Yes.

Q. And the industry grew up under that duty?—A. Yes. At that time the price of sumac was \$165 a ton—about three times its present price. We have reduced the price by making the article here.

By Commissioner OLIVER:

Q. At the time the duty was imposed it amounted to \$15 a ton?—A. Yes.

Q. And now you propose to make it \$20?—A. Yes.

By Commissioner GARLAND:

Q. You say that you have reduced the price of sumac?—A. We have reduced the price of foreign sumac by the domestic article competing with it.

Q. Is it not a fact that the farmers reduced the price on you?—A. Yes; that is the fact.

Mr. JONES also presented the following paper:

We most respectfully beg to present a few reasons for asking an increased tariff on foreign sumac and East India tanned goat and sheep skins, which we hope may commend themselves favorably to you.

The infant industry of sumac growing and manufacturing in this country has thus far struggled along, with the progress that we shall

hereinafter state, without any protection from the government. While the governmental policy has been to protect in some degree infant industries, ours has been left to take care of itself. There was a tariff of 10 per cent. ad valorem (for revenue) imposed on Sicily sumac during the late war, when there was no domestic sumac manufactured, and this tariff has remained without alteration since. In the face of all this, we have demonstrated to the consumers of sumac—especially the morocco tanners—that we can produce an article equally as good as the best Sicily; many of the morocco tanners who tan black stock say they would prefer to use the domestic were the cost the same as that of the higher-priced Sicilian. Virginia sumac, gaining so much favor for its excellence, induced many to go into its manufacture, developing the industry all over the State; and whereas it commenced with a consumption of 100 tons per annum in 1865 sixteen years later (in 1881) it had grown to a consumption of 10,000 tons per annum. The price of foreign sumac has been steadily reduced as the domestic has come in favor. And just here we will say that frequently foreign sumac is brought to this country as ballast for vessels bringing fruits, &c., at as low a rate of freight as we can ship from Virginia to the markets; the *cheap labor* of Sicily enabling manufacturers there to bestow so much more labor in the cultivation and handling of stock than we can by reason of our higher priced labor, which is the sole reason, in our judgment, of the superiority of their goods over ours for light-colored stock. We pay our labor here in the sumac industry over 1,000 per cent. more than do the Sicilians, and, as we will hereinafter show the largest portion of the cost of the preparation of the article in this country is in the labor, you can readily see at what a disadvantage we are placed; this, with the competition among ourselves, has reduced the price of domestic, until now it only sells for about one-half of what it did seven or eight years ago. In fact, the business is just now threatened with total annihilation. The low prices have, in many instances, netted the manufacturers such heavy losses as to break them up entirely, while others have suffered serious embarrassment; so much so, that the manufacturers who had the temerity to continue in the business this year were forced, in order to protect themselves, to buy sumac leaves at a reduction that would probably leave some margin of profit; and, as a consequence, the price being reduced, the laborers who gather it from the wild bushes could not make it remunerative, so that many of them failed to gather as usual, but found more profitable work. This, with the utter indifference on the part of many manufacturers to further engage in a business which has proven so unprofitable of late, not more than one-half the mills being now in operation that were one year ago, has destroyed in one season one-half of this infant industry.

This season, which is just now closing, there will not be one-half of the quantity of sumac leaves gathered as were for each of the past several seasons; and whereas the 10,000 tons of last year sold for about \$450,000, and saved this amount to our country, the production this year at the same price of last year will not bring over \$200,000, thus the country loses in one single season \$225,000 on this one article; and when we remember that five-sixths of this amount is paid to labor for gathering the leaves and manufacturing the same, all being confined to Virginia, the loss to labor in this limited section, not to say anything of the loss to the manufacturers, is very considerable; and this falls almost entirely upon a poor class of negro laborers, who at this season of the year when leaves are gathered have no other occupation. There is annually imported into this country about 7,000 tons Sicily sumac, at a cost to the

country of \$500,000, on which the government receives a supposed revenue of 10 percent. ad valorem; but in consequence of incorrect invoices rendered, it gives comparatively no revenue to the government, and has stifled the industry of sumac growing and manufacturing in our own country. If a specific duty of not less than \$20 per ton is placed upon the imported article, we think the consumption of domestic sumac will run up to at least 13,000 tons per annum; and we are sure in a short time we will be enabled to supply the whole demand of our country, even to those who are now most wedded to Sicily sumac, for with demand and increase of value will come cultivation of the domestic, and, as a consequence, more care in gathering and curing; and every advantage which is now claimed for Sicily sumac will thus be overcome (on this point see Report No. 26, Department Agriculture, page 17), saving to this country \$600,000 to \$700,000 per annum.

We wish, also, to especially second the movement inaugurated by the National Morocco Manufacturers' Exchange, asking an increased duty on East India tanned goat and sheep skins. This question has been ably argued by the morocco manufacturers before your honorable body, and we only wish to add to what they have so well said, that if a protective tariff should be placed on said tanned skins, that it would give a consumption of 3,000 tons more annually to Virginia sumac, saving to the country the value of this article, say, \$150,000 per annum, besides the immense saving to labor in this country in tanning the same skins here.

Mr. Chairman and gentlemen of the Tariff Commission, we most respectfully ask that you make a favorable report on this our petition.

(Signed.)

WILLIAM G. CRENSHAW.

RICHMOND, VA., *September 28, 1882.*

Mr. WILLIAM G. CRENSHAW, president of the Atlantic and Virginia Fertilizing Company, and vice-president of the Sulphur Mines Company of Virginia, said:

I do not think that Congress ought to, or would, entertain any idea of putting a duty on fertilizers, although last year there were importations of fertilizers here to the extent of hundreds of thousands of tons, and some of my friends in the trade suggested that we ought to go before Congress and ask for the imposition of a duty upon them. My own opinion is that no duty is needed on them while we make fertilizers cheaper in this country. I say that, first, in my capacity of manufacturer of fertilizers.

But the point which I wished to bring to the attention of the Commission was in reference to a communication made to the Commission some time ago by Mr. Joseph Campbell, proposing to admit Spanish pyrites free of duty. It pays a duty now, but nothing like the duty which the law requires. The Treasury Department, however, has the matter in charge, and will have it looked into. I submit a paper which I wrote to the editor of the Oil, Paint, and Drug Reporter a short time ago, in reply to Mr. Campbell's communication. It is as follows:

SULPHUR PYRITES.

Editor Oil, Paint, and Drug Reporter:

In your valued journal of the 9th of August you publish the report of an argument made by Mr. Joseph Campbell before the Tariff Commission on the subject of placing pyrites, or, as he calls it, sulphur ore, on the free list, because, as he said, it would only be used in making sulphuric acid for manufacturing fertilizers, and because the pyrites found in this country were too impure to be used, and that consequently the imported pyrites would enter into competition only with imported Sicilian brimstone.

We quite admit the correctness of Mr. Campbell's statements as to the amount of fertilizers used in this country and the great difference in the cost of sulphuric acid when made from pyrites instead of brimstone; but we must object very decidedly to his other statements, and trust that before acting on Mr. Campbell's recommendations the Tariff Commission will be placed in possession of the true facts. In order to correct his misstatements we promptly wrote to the chairman of the Commission, then at Boston, on the day we first saw Mr. Campbell's statements, asking the privilege of going before them; but, owing to their having gone West, we have as yet had no reply, and therefore now beg to call your attention to this matter.

As Mr. Campbell says the English manufacturer of sulphuric acid buys his pyrites at \$6 per ton, but he omits to state that this price is only for the sulphur contained in them, the residue being returned to the seller, who then extracts from it the copper and iron which constitute the principal value of the pyrites.

As will be seen from the returns of the Board of Trade of Great Britain, the invoice cost of pyrites imported into England has ranged, in a series of years, from \$11½ to \$12½ per ton. When freight and other charges are added to this, it will be apparent that the importer could not deliver in England pyrites at \$6 per ton.

The Spanish pyrites contain from 3½ to 4½ per cent. copper and about 40 per cent. iron, and these metals constitute its principal value.

If Mr. Campbell's views are adopted the government would lose about \$3 per ton, being the duty now due on pyrites; that is to say, duty on 78 pounds (3½ per cent. in a ton) of copper at 3 cents per pound, \$2.34, and the 20 per cent. duty on the iron in it.

We estimate 3½ per cent. as being an average of the copper in imported pyrites. As a rule, Spanish pyrites have more, say 3½ to 4½ per cent., but some ores are imported from Canada which contain only about 3½ per cent.

Again, his statement that American pyrites are too impure to be used in making sulphuric acid is not in accordance with the facts. The Spanish pyrites are impure and

cannot be used in making sulphuric acid that must be pure for chemical purposes; but we are now mining in Virginia perfectly pure pyrites that are absolutely free of copper and arsenic, as shown on analysis by twenty different chemists, including Dr. A. Voleker, of London; and we understand that the Milan mines of New Hampshire are also pure. So, if pyrites are allowed in free of duty, instead of their entering into competition only with imported Sicilian brimstone, they would come into direct competition with the pyrites of this country, which, as I have stated, are absolutely pure for chemical purposes, besides allowing by such free importation the bringing in of a large quantity of copper and iron ore free of duty. This, we are certain, Congress has no idea of allowing.

WM. G. CRENSHAW.

I have also published a circular which I have addressed to all the manufacturers of sulphuric acid in this country. (The paper is appended to this statement.)

By Commissioner OLIVER:

Question. What do you recommend?—Answer. That everything stand as it is. It would be very hard, just as we have opened this bed of pyrites, to have Spanish ore admitted free of duty. We made the purchase of our property on the basis of existing facts. They put Spanish pyrites among the unenumerated articles, on which 20 per cent. ad valorem is paid. This brings the duty down to 60 cents per ton. They value it here at \$3 per ton, while in England it is worth \$12 a ton. Of course, these are not questions for the Commission to take up, but for the Secretary of the Treasury, and we have called his attention to them. We only ask that there shall be no change made in the existing rates of duty. We can make sulphuric acid as cheap here by burning the pyrites as it can be made in England.

The PRESIDENT. But if there be any doubt as to the action of the Secretary of the Treasury, you should be more specific in your statement.

The WITNESS. I do not think there is any doubt of it. The coppermen will take care of that.

Commissioner OLIVER. Nearly every gentleman who has been before the Commission has agreed in recommending specific duties instead of ad valorem. The present duty is 20 per cent. ad valorem. If a specific duty be recommended it would be so much per ton of material. You should state what that specific duty ought to be on the ore—on the material without analysis.

The WITNESS. The ore that comes from Spain contains copper and iron. But the point is, that it is not introduced as copper ore but as Spanish pyrites, and is invoiced at \$3 a ton, although it is worth \$12 in London. We only wish that the present law shall be complied with, and that the duty shall remain as it is on pyrites. The law is very explicit that all ore shall pay 3 cents a pound on the copper that it will analyze. If a ton of pyrites analyzes 3 per cent. of copper that would be 67 pounds, and 3 cents a pound on that would make the duty on the ton of Spanish pyrites about \$2. I think it would be a great outrage to take the duty off pyrites.

By Commissioner BOTELER:

Q. You say that you can sustain yourselves in the production of fertilizers at the present duty, and that the prices will not be increased to the consumer.—A. We say that the 20 per cent. ad valorem should be calculated, not at \$3 a ton, but at \$11 or \$12 a ton, as it is in England. That is a matter for the department. Our position is that the Spanish pyrites should not be among the unenumerated articles, because it is copper ore.

Commissioner OLIVER. We want you to suggest a specific duty on Spanish pyrites—so much per ton—and then this trouble will be avoided.

The WITNESS. Then I would recommend a tax of \$3 a ton on pyrites, which about covers the present duty on the analysis of copper and iron in it.

By the PRESIDENT:

Q. Are you familiar with the pyrites operations of Georgia, near Atlanta?—A. I know that they are carrying on a manufactory there on a small scale.

Q. And they are saving all the copper and all the iron?—A. They were preparing to do so when I was there in July. Our ore has no copper in it—nothing but iron pyrites. The Georgia pyrites have copper in them.

By Commissioner BOTELER:

Q. It was stated before the Commission that there was no suitable pyrites in this country.—A. That is the statement made by Mr. Campbell, to which I was replying. In Virginia there is an unlimited quantity of pyrites. It is only a question of cheap mining and of cheap transportation to market. We naturally think that our pyrites is the best and purest and most accessible. It would be very unkind in Congress if, just as we are beginning to develop this industry, which is likely to lead to very great results in the United States, it were to remove or reduce the duty. Sal soda and the other chemicals needed can be made cheaper in the Kanawha Valley than in any part of Great Britain.

Commissioner BOTELER. Then it is an infant industry, and is of interest to the farmers of the country?

Mr. CRENSHAW. Yes.

The following is the circular referred to:

[Agency of the Sulphur Mines Company of Virginia, 48 Wall street. Address, P. O. Box 108.]

NEW YORK, September 1, 1882.

To the manufacturers of sulphuric acid in the United States:

GENTLEMEN: Professor Lunge, in his admirable work on sulphuric acid, issued a few years since, called attention to the fact that while in Europe all sulphuric acid was made from pyrites, except a few tons which needed to be pure for chemical purposes, yet in the United States brimstone still continued to be exclusively used; but he added, "It is only a question of time when the United States must change and use pyrites instead."

When Lunge wrote as above he was of course aware that large beds of pyrites existed in this country, but he evidently did not know that any of it was entirely free from arsenic, and therefore suitable for manufacturing sulphuric acid absolutely pure for chemical purposes.

This fact has only been proven in the last few months.

The rapid increase in the production of sulphuric acid in the United States, as shown in the importation of 105,000 tons brimstone in 1881 against 18,000 in 1868, had not equaled the demand, and hence prices continued very high up to a few months ago—high enough to leave the profits of the business sufficiently large to justify manufacturers in ignoring the cost of sulphur.

This seems now to have changed, the price of sulphuric acid having become so low that it is doubtful whether there is now any inducement to build a chamber to manufacture sulphuric acid made from brimstone, if it has to be sold at present prices.

In Great Britain the importations of pyrites, mostly from Spain, have increased from 230,000 tons in 1868 to 605,000 tons in 1881, say, nearly three-fold in thirteen years, while the importation of brimstone decreased from 63,000 tons in 1868 to 41,000 tons in 1881, notwithstanding the largely-increased demand for brimstone for making powder and for other purposes.

The low cost of sulphuric acid in Great Britain made from the pyrites has enabled her to furnish this country almost exclusively with soda-ash and other chemicals; but it is only within the last twelve months that she has seen it to her interest to carry our phosphates from South Carolina, dissolve them in sulphuric acid, and return them to us as fertilizers cheaper than we can make them here. This has been done in the last year to the extent of over 100,000 tons.

The manufacturers of sulphuric acid in this country can no longer ignore the cost of sulphur, and Lunge's prophecy that "pyrites must be extensively used in the United States" will soon be realized, provided pyrites can be furnished to the chemical works in this country equal to, if not better, in quality and uniformity, than any that are used in Great Britain, and at about the same cost.

Can this be done?

We answer unhesitatingly, Yes!

From our mines in Virginia we are now prepared to furnish pyrites, and contract for its delivery for a term of years, containing from 45 to 50 per cent. of sulphur, chemically pure, as evidenced by the several analyses shown below, including that by Dr. A. Volcker, of London, than whom no chemist stands higher; the burning quality of which has been tested at the leading chemical works near Glasgow, and also at the large chemical works of Mr. Peter Spence, of Manchester, England, a copy of whose reports we hand below.

The purity of the pyrites is referred to more than once in the annexed letters, and has been proven by every analysis we have had made.

The freedom with which it burns, and the entire absence of fused pieces and clinkers, is also referred to in the annexed letters, and has been proven in our burning in this country.

The cinder, after being burned, analyzed 87 per cent. of sesquioxide of iron, and can be ground into an iron paint of the very best quality. It contains about 65 per cent. of actual iron metal, and will doubtless find a market in the manufacture of pig iron.

Each manufacturer is entirely competent to make his own calculations of the comparative cost of burning pyrites and brimstone. For our own satisfaction and for your criticism we have made an estimate, based on our knowledge of the subject, which we hand you below. You will see that we provide in our estimate for the fact that chambers of a given capacity will condense more fumes from brimstone than from pyrites, and will therefore make more acid, but yet the profit on the smaller quantity from pyrites is so much greater than from brimstone that this difference is not worth consideration.

It is also said that the lead of a chamber will have to be renewed two or three years sooner when burning pyrites than brimstone, but the difference in profits is so much greater that, even if we have to put new lead on the chambers every year, it ceases to be a matter of any importance.

We think the facts herein set forth will convince you that this subject is worth examination; and as we believe that we have the largest quantity of pure and uniform pyrites in this country, and that we can put it into the market at the least possible cost, we shall be glad to confer further with you on the subject.

We beg leave also to advise you that we have secured the control of the patent in this country of Mr. Peter Spence's automatic furnace, in which our pyrites was burned at Manchester last year, and by which there is actually less labor incurred in burning our pyrites than in burning brimstone. We are prepared to arrange for the building of this furnace when it is wanted.

WILLIAM G. CRENSHAW,
Vice-President of the Sulphur Mines Company of Virginia.

REPORTS OF ANALYSES.

[By Dr. A. Volcker, of London, June 30, 1881.]

Sulphur	48.02
Iron	42.01
Ferrie oxide	1.93
Sulphuric acid44
Silica	7.60
Copper	none.
Arsenic	none.
	<hr/>
	100.00

[By Dr. W. H. Taylor, State chemist of Virginia.]

Sulphur	46.40
No arsenic.	

[By C. Hope, of Charles Tennant & Co.'s St. Rollox Chemical Works, Glasgow, June 3, 1881.

Sulphur.....	50 per cent. dry, say 93.8 per cent. bisulphide of iron.	
Copper.....	none.	6.2 per cent. silicious matter,
Arsenic	none.	100

This pyrites can be burnt instead of sulphur for giving vitriol free from arsenic.

Report on pyrites burnt at Spence's works.

Began on one side of a double furnace, charging through the automatic hopper 10½ pounds every five minutes, at 12 m., July 12, 1881. Burnt 4,500 pounds dust pyrites received from Tennant & Co., Glasgow, till 10 p. m., July 13, say 34 hours.

When charged, Spence's analysis showed 4 per cent. moisture, 48.57 sulphur.

Analysis of cinders from furnace showed—

	Sulphur.
At 9 a. m., July 13, or say 21 hours burning	3.22
At 1 p. m., July 13, or say 25 hours burning	1.08
At 2 p. m., July 13, or say 26 hours burning	1.22
At 6 p. m., July 13, or say 30 hours burning	1.22

Report from an eminent chemist and manager of one of the largest alkali works in Great Britain, dated October 31, 1881, in regard to burning our pyrites.

Charged it into one of the beds of No. 6 furnace. Wrought it entirely by itself. Furnace was in good working order at the time of trial, and was working ordinary Tharsis ore dust.

The new ore wrought very free and open, much freer than Tharsis, and gave absolutely no fused pieces. Amount of heat given off was good—a bright-red heat all over the first four beds. The burnt ore was cold or burnt out before it reached the last bed. Twenty-five per cent. more work could be done in the furnace as compared with Tharsis ore; that is to say, could be burnt out in a given time.

"On the whole it is the best ore that I have seen for burning in the shape of dust, as there is no trouble in working it or in keeping the furnaces clean and in order."

He further says:

"As to the working of the ore, in this there is no difficulty whatever. It works much better than Tharsis pyrites; it contains no arsenic, and is therefore quite suitable for making pure acid for sale, and would replace for this purpose brimstone or sicilian sulphur. The lot we burnt averaged 3 per cent. of sulphur unburnt in the refuse, or showing that 95.3 per cent. of the original sulphur had been utilized. Without difficulty this can be improved to the extent of perhaps 2 per cent. more.

"Our furnace can do 25 per cent. more work with this ore than with the Tharsis ore, and I should be glad indeed if we could obtain materials of this class for our purposes here."

He writes again on 11th January, 1882, saying: "This ore is splendid stuff for making acid, being so pure."

Parties burnt our ore in Great Britain, and allowed us 23s. 3¼d. per ton as its value there.

ESTIMATED.—Comparative cost of manufacturing sulphuric acid from brimstone and from pyrites, based on one year's working of a set chambers with 110,000 cubic feet condensing capacity.

FROM BRIMSTONE.		FROM PYRITES.	
Cost of plant	\$30,000	Cost of plant	\$32,000
1,100 tons 2nds, \$31.50	34,650	2,100 tons at \$6*	12,600
88 tons nitrate, \$55	4,840	80 tons nitrate, \$55	4,400
Labor	1,200	Labor	1,200
Coal	1,200	Coal	1,600
	41,890		19,800
Interest, repairs, wear and tear, and superintendence, 20 per cent	6,000	Interest, repairs, wear and tear, and superintendence, 20 per cent	6,400
	47,890		26,200

* Of course the price of pyrites delivered at the chemical works must depend upon the location and distance from the mines.

FROM BRIMSTONE.		FROM PYRITES.	
Yield, 4,950 tons chamber acid, if sold at \$11 per ton	\$54,450	Yield, 4,050 tons chamber acid, if sold at \$11 per ton	\$44,550
Profit (say 13.69 per cent. on annual expenditure)	6,560	Profit (say 70 per cent. on expenditure)	18,350
If sold at \$10 per ton	49,500	If sold at \$10	40,500
Profit (or 3½ per cent. on expenditure)	1,610	Profit (or 54 per cent. on expenditure)	14,300
If sold at \$9 per ton	44,550	If sold at \$9 per ton	36,450
Loss	3,340	Profit (or 39 per cent. on expenditure)	10,250
Cost of chamber acid, \$9.71 per ton of 2,000 pounds.		Cost of chamber acid, \$6.47 per ton of 2,000 pounds.	

R. E. BLANKENSHIP.

RICHMOND, VA., *September 28, 1882.*

Mr. R. E. BLANKENSHIP, president of the Chamber of Commerce, an iron manufacturer, of the Old Dominion Iron and Nail Works, addressed the Commission.

He said that Virginia was largely engaged in the manufacture of iron, and that that interest was rapidly increasing there. He did not propose to express any opinion as to the tariff on iron and iron products further than to say that the matter had been fully discussed at the recent Iron and Steel Makers' Convention at Cresson, Pa., and that the results fully met the wishes and needs of the iron producers of Virginia. The iron interest of Virginia has been built up entirely under the present tariff, and therefore those engaged in it believed that any reduction of the present duties on iron would be very much against their interest and to their loss. The action of the Cresson convention was the action of the iron-masters of Virginia. They were all interested in the production of ores; in fact, iron ore might be said to be an agricultural product in Virginia, for every farmer in the James River Valley firmly believed that he had an iron mine on his land. They wanted a specific duty on iron ore because an ad valorem rate of 20 per cent. meant on the iron ore dug in Africa 20 cents a ton. There were now in the State of Virginia two very large furnaces, and another was being built that would rival the largest. It would not be in blast until next January or February. There was one just beyond it, that had been making 130 tons a day, and would soon be making 150. There were also several small furnaces in the State, and all of them were doing well under the present state of things. They therefore wanted to be let alone, although they did not object to having the duty on iron ore slightly raised.

By Commissioner BOTELER:

Question. I understand that this ore belt is known as the James River ore belt. Are those ores well adapted to the Bessemer process of making steel?—Answer. It has been stated over and over again that such ores do exist there; but I cannot say of my own knowledge whether they do or not.

Q. They are not developed yet?—A. No, sir.

Q. Do you know anything of their probable quantity? Do they seem to be well-defined veins, or mere pockets, or what?—A. It is claimed by the Iron and Steel Association of Virginia (the Victoria Company), which is now building a large furnace near Goshen, that, in the bank, that it owns now, it has ore enough to supply this large furnace and make 175 or 200 tons a day; and that, as soon as it puts this furnace in blast, it will break ground for a second furnace, and that all the ore demanded can be obtained.

Q. Are they hematites?—A. Yes, sir.

Q. You say that the introduction of iron ore free of duty would be very disastrous to Virginia?—A. It would, indeed.

Q. It has been very strongly urged on the Commission to recommend that iron ore be put on the free list.—A. I read with a good deal of curiosity Mr. Abram S. Hewitt's statement before the Commission at Saint Paul, and I turned the paper upside down and crosswise, and I have not been able to understand it yet. I cannot make anything out of it.

Q. Is there not an awakening feeling in Virginia to develop her resources?—A. We are in Virginia essentially a working people. There is no people on the face of the earth that works harder than the people in this State. In 1865 this whole city was in ruins. Some 1,540 houses in the principal business portion were destroyed. We did not collect a dollar of insurance. Our currency was absolutely worthless, and all our property (including that in slaves) destroyed. We started with nothing but our hands and our ability to work. You see to-day the city which we have built up and what has been done in the State. In spite of some of the worst legislation ever known in the history of the world, with reference to the State debt, our people have gradually built themselves up. They are comparatively out of debt. I expect that the State is richer to-day than it ever was before. That is my own opinion as a merchant and a manufacturer.

Q. Your idea is, that with the material resources which Virginia possesses, and now that her young men have learned the important fact that not to work is not to be respected, and that they have taken off their coats for the development of her resources, the future of Virginia is, perhaps, brighter than it could have been, or had been, under the old system?—A. I think so. In all my acquaintance in this city I do not know the young man who does not work, with those occasional exceptions that are found in all communities. The outlook for the State is very bright, barring bad legislation.

By Commissioner OLIVER :

Q. What is the feeling of the people of Virginia with regard to the reduction of the present tariff?—A. So far as my information goes, I should say that the mass of the people of this section of the State are protectionists. They may not be protectionists in the same broad sense that I am one. They believe in what is sometimes called a tariff for revenue, with incidental protection. That seems to be the favorite form of expression. In Richmond the people are overwhelmingly protectionists. An evidence of that fact is, that in the last Congressional election there were three candidates in the field—regular Republican, Readjuster, and Democrat—and they all three were striving hard to show that each was the best protectionist. Nobody could be elected in this district unless he was a protectionist. Of course, among the gentlemen who meet in this room there is a diversity of opinion. I am stating now my own individual opinion, not speaking for the Chamber of Commerce. We have merchants and importers in this body, and I think that free-trade sentiments are always to be found among the importers.

The PRESIDENT. And among college professors.

Mr. BLANKENSHIP. College professors and doctrinnaires. Having been born and raised in the midst of the iron business it is not, of course, strange to hear me express ultra views on the tariff question. Down here, you understand, we are all Democrats.

The PRESIDENT. Gentlemen, we do not desire views on one side only. We wish it distinctly understood that the fullest and freest expression of opinion is invited.

Mr. BLANKENSHIP also spoke in favor of the maintenance of the duty on peanuts. He said :

It is a matter of very serious importance to the people of the counties below Petersburg that the duty on peanuts be retained at about 1 cent per pound, or be increased. Those people raise the finest peanuts that are grown in this country. They are not only using them as an article of food, but are manufacturing out of them a fine quality of salad oil. In five counties of this State the people received last year, for that product alone, over a million dollars. It is one of the staple crops of Virginia.

The PRESIDENT. Is the oil sold as peanut oil ?

Mr. BLANKENSHIP. No ; it is sold as the very best olive oil from Smyrna or Florence. It is put up in the most beautiful Florence flasks ; and I reckon it is about as good as the imported oil.

EDWARD T. STEEL.

RICHMOND, VA., *September 28, 1882.*

The following communication from Mr. EDWARD T. STEEL, of Philadelphia, in regard to iron ore, was read, and ordered to be printed:

Being informed of the purpose of your Commission to give a hearing in Richmond, Va., on the 28th instant, to the mining interests of that State, I take this means of communicating the facts in regard to the important iron interest which is now being developed by this company in Giles County, Southwest Virginia.

Pending the completion of the New River Railroad, which is just now reaching a point which we make available for shipments of iron ore, we have not fully developed the mines of which this company is the owner, but we have gone so far as to ascertain that at three points where we have a force at work there is a very promising outlook for a large supply of Bessemer iron ore, some of which is of the very best quality, and we expect to be in the market with these ores within a very few weeks.

We have made preparations at our principal mine, which lies directly on the line of the New River Railroad, for a very large output. The analysis of this ore, as reported to us by Professor McCreath, of Harrisburg, on samples personally taken by him at the mines, is as follows:

Metallie iron.....	63.550
Sulphur.....	.002
Phosphorus.....	.051
Siliceous matter.....	5.210
Phosphorus in 100 parts iron.....	.080

If our reasonable expectations should be satisfied at this mine, it will be apparent to your honorable Commission that a large field will at once be opened for the introduction of iron industries to Virginia, based on Bessemer ore.

We are investing a great deal of money at these mines in full faith of their success, and while we do not doubt that the question of protection to such an enterprise and its resulting industries will be earnestly and ably advocated before your honorable Commission, we take this opportunity to indicate our support of such a tariff as will amply protect us in a field where, from its geographical location, difficulties of labor, &c., it is subject to drawbacks not met with in more favored localities.

We feel that we speak for the whole State of Virginia, which is in so much need of some more sure reliance than agriculture, when we bring this question to your earnest consideration.

It is a fact which is, of course, familiar to your Commission that in the industry which we are prosecuting in Virginia we have most to dread the competition of foreign ores, which, in some conditions of the foreign market and periods of stagnation in ocean freights bound this way, without considering the duty, are laid down here at prices practically the same which obtain in the poorly-paid labor fields where they are produced abroad.

Under such circumstances as we have described, the foreign ore is not only sold at a very low price, but is sometimes brought here as ballast, absolutely free of charge.

N. V. RANDOLPH.

RICHMOND, VA., *September 28, 1882.*

Mr. N. V. RANDOLPH, of Richmond, paper-box manufacturer, made a statement in favor of the maintenance of the existing duty of 35 per cent. on paper boxes.

The wages of labor in that business, he said, was two-thirds less in Europe than here. The manufacturers of paper boxes were getting along very well, and the price to consumers was not exorbitant. The girls employed in his manufactory received a dollar a day, against 20 cents a day in France, 16 $\frac{3}{4}$ cents in Germany, and 13 cents in Sweden. And yet a great many paper boxes were brought here from Sweden. It was a large industry, employing a great many hundred thousand people. In Richmond alone there were about six hundred persons employed in that business. He thought that Philadelphia might be safely put down as employing ten thousand persons in it. A duty of 35 per cent. had enabled him to keep his factory running. He did not ask for any increase of duty, but that the duty should remain as it is. He had started his factory five years ago in this city with five employés; he now employed two hundred and seventy persons. His principal markets were New York, Boston, Chicago, Saint Louis, and Cincinnati. He had some little export business to Canada, Mexico, Australia, and South America—not because the duty enabled him to export goods, but because he made a different style of goods from those made in Germany and England.

J. S. PEMBERTON.

RICHMOND, VA., *September 28, 1882.*

The following communication from Mr. J. S. PEMBERTON, of Atlanta, Ga., in regard to the duty on quinine and the tax on alcohol, was read and ordered to be printed:

GENTLEMEN: I desire to present to you the views of a large majority of the Southern wholesale druggists and manufacturing pharmacists in regard to the tax on alcohol and the tariff on quinine. Those who have given the subject the most careful consideration entertain the following views:

1st. That the tax on alcohol should be abolished. It needs no argument to show or prove the wonderful increase it makes in the cost of medicines that are in constant use; yet it may not be amiss to compare a few items relative to this tax.

In 1860 the cost of a barrel of alcohol was about \$10; to day it costs about \$85. The tax is five times the cost of the article. Every item into which alcohol enters is enhanced in value to the proportionate value of the alcohol which enters into the product. What a monstrous and unjust burden is thus placed upon the poor and sick. These very people are taxed to an extent which is a burden hard to be borne.

This tax on alcohol was a war tax, which was cheerfully borne during the necessity for its existence, and should now be abolished and wiped out. The magnificent export trade once carried on with foreign countries, in products in which alcohol is necessarily used, is almost entirely abandoned, or is carried on under such restrictions that the majority of manufacturers cannot engage in it; and all this trade has been diverted to competing nations. Those chemical and pharmaceutical products in which this country excels are shut out by this odious tax. The sooner this tax is abolished the better it will be for the nation.

2d. I believe that Congress should either levy a tax of 10 per cent. upon quinine and all its salts, or remove the duty now imposed upon the cinchona barks. This will not only protect our manufactures, but also the trade and the public in a more uniform and lower price, as well as the purity of the article.

I believe it manifestly unjust to admit quinine duty free and impose a tax upon the raw material from which the article is manufactured. It is certainly not the policy and design of the government to discriminate against one branch of our industry and protect another; such inconsistency is contrary to all the well-established principles of justice and equity.

To foster and protect all our manufacturing industries requires the removal of the tax upon alcohol, and to either place a duty of 10 per cent. upon quinine and its salts, or remove the duty from the material from which it is manufactured.

CHARLES B. BALL.

RICHMOND, VA., *September 28, 1882.*

Mr. CHARLES B. BALL, of Richmond, secretary of the Tanner & Delaney Engine Company, addressed the Commission. He said:

I speak as a citizen of Virginia, and desire only to utter my earnest and decided conviction in behalf of the wisdom and policy of protection. My views on that subject were formed in my early manhood, when I was a follower of the illustrious man who established the American protective policy of that day. I think that the subsequent history of this country tended to strengthen and confirm my views on that subject. Especially at this moment in this Southern country and in Virginia, abounding in mineral and other resources that are absolutely illimitable, I think that a wise and judicious system of discrimination in the tariff in favor of domestic enterprise and manufactures is called for by the very highest interests of this country. I have no special familiarity with manufacturing enterprises or industries that are now booming all over the country, except with one with which I have been connected for the last few years. But I desire again merely to express, as a citizen of Virginia, my earnest conviction that the true policy of this country is to be found now in the revision of the tariff. It is a war tariff, and is too high in a great many particulars. It ought now to be so revised as to furnish a full and ample revenue for all the wants of the government, and at the same time to discriminate in favor of the protection of the great industries of the country.

PHILIP SINSZ.

BALTIMORE, MD., *September 29, 1882.*

Mr. PHILIP SINSZ, importer of glaziers' diamonds, made the following statement:

My business is manufacturing glaziers' diamonds, and by a construction placed upon the words "Diamonds, rough or uncut, including glaziers' diamonds," in section 2505, designated the free list, of Title XXXIII, duties upon imports, of the Revised Statutes of the United States, the manufactured tool known as the glaziers' diamond is annually imported free of duty in a quantity the minimum valuation of which, I believe upon information, to be \$25,000.

I am one of four persons who are engaged in this country in the manufacture of glaziers' diamonds, and should I or they desire to import any of the separate wood, steel, or brass parts used in our manufacture of the article designated the glaziers' diamond, without the diamond itself, we would be obliged to pay the duty levied on manufactures of brass, wood, or steel, being 35 or 45 per cent. ad valorem, respectively.

The foregoing is the result either of an inadvertency in the wording of the law, an improper construction of its language, or else an unjust discrimination against the class of manufacturers to which I belong. It certainly looks very anomalous and inconsistent that an article manufactured completely in a foreign country, and competing with domestic manufacturers, should be admitted free of duty, when the component parts are liable to a duty according to material, although intended to be perfected by the skilled labor and the capital of American citizens.

The business and capital of myself and others similarly engaged is seriously endangered by the foreign competition allowed as stated above, and I would therefore most respectfully, on behalf of myself and others engaged in the manufacture of glaziers' diamonds, suggest that the implements or tool "the glaziers' diamond," manufactured in a foreign country, may be excluded from the free list by inserting the word "unset" after the clause as it appears in the law, or as your honorable body sees best fit.

S. E. CHAMBERLIN.

BALTIMORE, *September 29, 1882.*

Mr. S. E. CHAMBERLIN, special agent of the Treasury Department, appeared before the Commission and made the following statement:

A careful examination of the history of legislation with regard to the importation of raw sugars and the exportation of refined sugars for the benefit of drawback, develops the fact that serious difficulties have surrounded this matter, and much study and experimental investigations have been deemed necessary by the principal enlightened nations of the world to obtain facts to base fair and equitable laws upon to govern the sugar trade of such countries. It would seem that such conclusions as have been reached and decided upon by these nations, so far as they are applicable to the present condition of our own country, should be carefully considered, and their results utilized.

Great Britain, France, Belgium, and Holland, in an international convention held November 8, 1864, agreed that classes of raw sugars should be determined upon by experiments, and as their results, certain standards were approved in order to establish uniformity in providing rates of drawback. With this view, therefore, the color of the sugar was adopted as the criterion to determine their saccharine richness, and, for the further purpose of providing for the assessment of duties, sugars were divided into a number of classes, based upon those conclusions, and now known as the Dutch system of standards, viz:

From No. 14, Dutch standard, to No. 18, are called the 1st class.

From No. 10, Dutch standard, to No. 14, are called the 2d class.

From No. 7, Dutch standard, to No. 9, are called the 3d class.

All sugars below No. 7, Dutch standard, are called the 4th class.

All sugars above No. 18, Dutch standard, are called refined sugar.

At the time of enactment of our present tariff regulating the duties on sugars imported into the United States commercial raw sugars were valued in both mercantile and government transactions by the above-mentioned system of Dutch standards. Raw sugars were bought and sold by these color standards in every sugar market in the world. They are based upon the principle that the element of color in all sugars is intimately connected with that of saccharine strength, and that "cane sugar is composed of pure sugar and molasses, and as pure sugar is white and molasses black, the mixture of the one with the other gives varying shades of color, according to the proportion of the admixture;" and upon this color the value of the crystallizable and non-crystallizable sugar was determined. This close correspondence between the grades of color and the degrees of saccharine richness rendered these terms, in effect convertible ones, and guaranteed to the merchant security in his transactions, and orders were given for sugars by numbers of the Dutch standard, each number determining the intrinsic value of such sugars.

As long as the manufacturers of raw sugars confined themselves to making natural-colored products, this condition of affairs maintained itself as being the most equitable arrangement for all parties concerned. Later, however, a new element entered into the composition of these values. Sugars were artificially colored, and a counterfeit hue given them. This standard then failed to measure their value.

In France, in July, 1875, there was a law passed providing that where the color of the sugars does not appear to correspond with their effective richness a legal *expertise* should be taken, and the *commissaires experts* should have recourse to saccharimetry for the definite classification of sugars.

The present tariff, by virtue of the law of December 30, 1875, is as follows:

Classification by Dutch standard.	Richness of sugar comprised in each class.
Below No. 7, Dutch standard.....	Less than 76°.
From No. 7, inclusive, to No. 9, inclusive.....	From 76°, inclusive, to 85°, inclusive.
From No. 10, inclusive, to No. 14, inclusive.....	From 85°, inclusive, to 92°, inclusive.
From No. 15 inclusive, to No. 18, inclusive.....	From 92°, inclusive, to 98°, inclusive.
Above No. 18.....	98° or more.
White crystals.....	

Table of analysis of sugar made under the direction of the French Government. (The mean results obtained in the laboratories of the government during the year 1878.)

CANE SUGAR.

Classification by Dutch standard.	Number of analysis.	Degrees of polarization.	Per cent., glucose.	Per cent., ash.	Per cent., water.	Per cent., unknown.	Effective re- diment, re- fined sugar.	Legal re- diment, loaf sugar.
Not above No. 7, Dutch standard..	768	85.01	4.70	1.20	4.26	3.75	69.88	67

White crystals.....								

In France, as has been seen, raw sugars are divided into classes by the Dutch standard, nearly similar to the grades established by the United States tariff. The two lower grades are identical, and a certain yield of refined sugar is assigned to each class. This, which is called the legal yield, is the average between a minimum and a maximum of saccharine richness. For instance, the class of sugars below No. 7, Dutch standard, comprises all sugars polarizing below 76 degrees of saccharine richness, and the legal yield of this class is 67 pounds refined loaf sugar to 100 pounds raw sugar. The next grade, from No. 7 to No. 9, Dutch standard, inclusive, comprises all the sugars from 76 degrees to 85 degrees, and the legal yield of this class is 80 pounds refined loaf sugar to 100 pounds of raw. Both of the above classes are absolutely the same as grades "below 7" and "7 to 10," Dutch standard, United States tariff, and comprise identically the same raw sugars, from the same sugar-producing countries.

Under date of September 25, 1880, the following edict was issued by the Government of Holland:

ARTICLE 1. The richness of sugar which is recognizably colored, or whose quality permits the supposition of a higher degree of richness than that of the highest number of the class to which it should according to the color standard belong, is determined in the following manner:

(a.) Every sample of sugar to be examined is, for the purpose of the investigation, to be made uniform by grinding fine and mixing, and especially in such manner that

no alteration in the composition may take place from loss or absorption of water, or in any other way.

(b.) Of the sample a portion is weighed off of such weight as may be necessary, in order that if it consists of perfectly pure and dry sugar it will, by means of the following manipulations, yield a return of 100 per cent. on the polariscope. If the sugar is wet or soft the portion taken for the assay is to be dried.

(c.) The assay is then successively drenched (*doortrokken*) with—

1. Alcohol of at least 99.5 per cent.
2. Alcohol of 96 per cent. perfectly saturated with sugar.
3. Alcohol of 92 per cent. also saturated with sugar.

It is furthermore washed out with a mixture consisting of one volume of acetic acid (of 390 to 430 grams of anhydrous acetic acid to the liter) and nineteen volumes of alcohol of 85 per cent., which mixture is also saturated with sugar.

After washing out those ingredients that are soluble in the washing liquid, this is removed by means of a second successive drenching of the assay with the liquids named under 1, 2, and 3, but this time in inverse order; also, first with No. 3, then with No. 2, and then with No. 1; finally, this last liquid is also removed from the assay.

(d.) The assay thus treated is then dissolved in water, under employment of the necessary clarifying and decolorizing agents, and the percentage polarization of the decolorized liquid is then ascertained.

(e.) The result obtained by the careful execution of the before-named operations expresses the percentage contents of the sample.

ART. 2. The classification of the sugar results from the comparison of its contents with that which in the following table is given as the highest limit for each class:

Classes for the purpose of appraisement.	Highest limit of each class in classification by contents.	
	Numbers.	Contents.
14-10	15	<i>Per cent.</i> 97.8
9-7	10	94.4
Below 7	7	87.4

That sugar which has a higher contents than 97.8 per cent. falls in the first class.

The foregoing regulations are more fully explained in the circular of the Ministry of Finance of the Kingdom of the Netherlands, relating to the introduction of the new regulations in the appraisement of imports, from which the following is taken:

The law of May 25, 1880, has by no means for its object the general substitution of saccharometric methods for the color standard in the classification of raw sugars. The changes which it is intended to introduce in the existing conditions relate solely to sugars that have been purposely colored, or whose general characteristics lead to the presumption of a higher degree of richness than that of the highest number of the class to which it would according to the color standard belong. In these two special cases the contents in sugar shall be determined by the method of polarizing after washing out, as described in the royal edict of September 25, and these sugars shall be classified according to the relation that the contents in sugar so found bears to the scale based on the investigation conducted in a similar manner of Java sugars of the numbers 15, 10, and 7 (that is to say, of a number above the highest of each class).

In this class may be named the well-known vacuum-pan centrifugal sugars, which are made expressly for the United States market, and adapted to suit the deficiencies of the present tariff. In these sugars we find a large amount of saccharine strength, without a corresponding quality of color, and a close examination shows them to be a semi-refined sugar, carrying on the surface a small amount of intensified color, such as to impart to them an artificial dark appearance, different from what naturally belongs to sugars of their saccharine strength. In fact, the molasses that gives the dark color to natural-made sugars has been removed, and some artificial dark color substituted. For sugars of this class the system of Dutch standard ceases to be available, and some

means should be devised to ascertain the true, natural color, for which the apparent one has been substituted, in order to make an equitable assessment of duty, and a just return in drawback on refined sugars exported.

In entering upon the consideration of the amount of drawback to be allowed upon sugars refined for exportation, there are two points to be considered: First, what is the duty to be refunded as drawback, under our law (sec. 3019, Revised Statutes), which provides that "there shall be allowed on all articles wholly manufactured of materials imported, on which duties have been paid when exported, a *drawback equal in amount to the duty paid on such materials, and no more*; secondly, what means shall be adopted or devised to ascertain the just proportion of refined sugar upon which the import duty should be repaid in drawback.

Our sugar tariff was framed for the purpose of allowing unrefined sugars to be admitted under a graduated scale of duties, increasing directly in proportion to the superiority of the sugar in regard to its saccharine value, or, in other words, according to the quantities it was presumed to contain of pure sugar and molasses. By this system the duties bear an equitable relation, and low sugars are free to come in and compete on a fair footing with those of a higher quality. Upon this construction of our tariff laws the regulations with regard to the practical application of drawback governing the exportation of refined sugars have heretofore always been made. Thus we find the rates established December 17, 1875, specifying 3.60 per hundred on each hundred pounds of refined, loaf, cut-loaf, crushed, granulated, and powdered sugars exported, to be based upon a maximum output of 60 per cent. of hard sugar, from sugars paying the lowest rate of duty, 2.18 $\frac{3}{4}$ cents per pound. Later on, however, October 1, 1877, we find the output to have been materially increased from nominally the same sugars, and drawback of 3.18 per hundred on each hundred pounds, and the duty on sugar remaining the same. This change indicated a yield of this class of sugars below No. 7, Dutch standard, paying 2.18 $\frac{3}{4}$ cents, of 68.79 per cent., or nearly 9 per cent. increased product, from the same class of sugars that formerly produced only 60 per cent.

If, however, as the fact really is, this sugar, so refined, not only produces an out-turn of 68 pounds of pure loaf sugar, but 22 pounds additional of the same sugar, making a total of 90 pounds out-turn, it will at once be seen that this refiner, when he has exported 68 pounds, and received his drawback of 3.18 cents per pound thereupon, which is equal to the amount of duty paid on the raw material, has still on hand 22 pounds, which have in reality paid no duty, because the whole amount of duty on the original raw sugar imported has been returned to him in the drawback received upon the hard sugar exported.

For the fiscal year of 1879 there were 116,862,583 pounds of refined sugar exported for benefit of drawback, and almost the entire amount received the highest rate of 3.18 cents per pound drawback; and vacuum-pan sugars were introduced below No. 7, Dutch standard, paying a duty of 2.18 $\frac{3}{4}$ cents per pound, that proved by analysis to be within one-half of 1 per cent. as pure in saccharine strength as the purest loaf-sugar refined and exported, and 3.18 cents per pound received as drawback.

Test by polarization of all sugars imported into the port of Philadelphia for the month of March, 1878.

Analysis of refined sugar that was exported from New York for benefit of drawback, made December, 1878.

Below No. 7, Dutch standard.		Above No. 7, and not above No. 10, Dutch standard.		Water.	Ash.	Organic substances.	Cane sugar.	Grape sugar.
No. of samples.	Test.	No. of samples.	Test.					
2	80 to 81	1	80 to 83	0.85	0.47	0.11	95.80	2.77
2	81 to 82	1	85 to 86	0.54	0.55	0.26	95.30	3.55
3	82 to 83	1	86 to 87	1.02	0.29	0.15	94.60	3.98
7	83 to 84	2	87 to 88	2.05	1.40	1.71	87.00	6.94
8	84 to 85	11	88 to 89	1.98	1.40	2.70	87.00	6.86
5	85 to 86	25	89 to 90	1.71	1.28	4.12	85.00	7.01
13	86 to 87	14	90 to 91	1.70	1.27	3.05	84.80	8.19
20	87 to 88	7	91 to 92	2.34	1.71	3.30	84.30	8.35
13	88 to 89	2	92 to 93	2.08	1.49	3.52	83.30	9.61
10	89 to 90	2	93 to 94	2.40	1.49	1.80	83.20	10.00
8	90 to 91	1	94 to 95	2.40	1.02	2.67	83.00	10.25
3	91 to 92	1	97 to 98	2.12	1.40	3.78	82.70	10.00
1	92 to 93	3	98 to 99	2.31	1.40	6.81	82.00	7.42
2	94 to 95	2.26	1.61	6.23	81.70	8.20
2	96 to 97	2.57	1.54	5.99	80.30	9.60
1	97 to 98	0.25	0.15	0.10	99.50	Trace.
1	98 to 99

It will be observed, by a comparison of these tables, that refined sugars are exported for benefit of drawback, showing as low saccharine strength as the lowest tests of raw sugars; and refined sugars of the highest test, receiving the highest drawback, 3.18 per pound, show but one-half of 1 per cent. more saccharine strength than raw sugar paying the lowest rate of duty, 2.18 per pound.

The establishment of a fixed ratio for the product of refined loaf sugar to the classes by color of raw sugars seems to have been satisfactorily agreed upon by other countries, after the most careful consideration. As these determinations were made upon classes arranged almost identical with those of our own schedule of sugars, and the experiments upon which they were based were made upon sugars from the same sugar-producing countries that supply our market, it would seem to apply to our own condition equally as well as to theirs.

By Commissioner OLIVER :

Question. What recommendation do you make in regard to the use of the polariscope?—Answer. I would use the Dutch standard in connection with the polariscope.

Q. Where would you make the dividing line?—A. Sugars below No. 7, Dutch standard, I would compare with sugar which should not exceed a certain polarization, but if found to be higher, I would say let it go into the next class above. Every merchant buys and sells sugar by polariscopic test. No matter what duty has been paid to the government, that does not determine the price to the consumer. The price the consumer pays is determined by its saccharine strength, and that is obtained by the use of the polariscope.

By Commissioner AMBLER :

Q. If, for commercial purposes, the polariscope is a sufficient test, what is the use of retaining the Dutch standard?—A. That is a question for your Commission to decide primarily.

Q. I understand the commercial world has settled down to the use of

the polariscope.—A. Yes, but they use the Dutch standard in connection with it.

Q. Do the merchants of this country use the Dutch standard?—A. No; but in other countries they do.

Q. Do I understand you to say that the sugar refining business has been almost entirely destroyed by this fact of the exporters having the advantage of this surplus left for sale, as mentioned by you?—A. Yes, largely.

Q. And you think that by the use of the polariscope there would be no margin left for sale?—A. I think that would be the effect.

Q. Suppose 95 per cent. is shown by the polariscope, will it not yield 95 per cent in refining?—A. Very nearly. In that connection I submit the following tables:

Table giving tests by polariscope of the saccharine strength of samples of Muscovado sugars, from different sugar-producing countries, imported into the United States, principally at the port of New York, in 1881.

[These samples were those upon which duties were assessed by color of the Dutch standard, some represented as high as 500 hogsheads.]

 From No. 7 to No. 10..... 90.24
 From No. 10 to No. 13..... 94.20

Table giving synopsis of the laws regulating the duties on the importation of raw sugars and the exportation of refined sugars, for the benefit of bounty or drawback of different countries.

UNITED STATES.

Classification by the Dutch standard.	Number of class.	Classification by the polariscope. Degrees of saccharine strength.	Rate of duty per 100 pounds, reduced to United States currency.	Effective remeasurement of loaf sugar for 100 pounds.	Drawback or bounty allowed on sugars exported.	Rate per 100 pounds, United States currency.	Remarks.
All sugars not above No. 7	1	\$2 18	On loaf, cut-loaf, crushed, granulated, and powdered sugars.	\$3 18	Sugar produced in the United States is not subject to duty. Polariscopes were used to determine duty on certain class of sugar. Treasury Regulations, July and September, 1879; discontinued March 14, 1882.
Above No. 7 and not above No. 10.	2	2 59	On white coffee sugar, undried, and above No. 20, Dutch standard.	2 58	
Above No. 10 and not above No. 13	3	2 81			
Above No. 13 and not above No. 16.	4	2 43	On all grades of coffee sugar, No. 20 and below in color, Dutch standard.	2 08	
Above No. 16 and not above No. 20.	5	4 06			
Above No. 20	6	5 00			

FRANCE.

Below No. 13, Dutch standard	Less than 90° polarization	\$5 73	Under the law of December 30, 1875, drawbacks are allowed under a graduated scale of yields from less than 76° to 98° and above, polariscopic test. When the refiner exports the amount designated as the yield of each class, he receives back the duty he paid, 100 pounds of raw sugar of that class.	Sugars imported from countries out of Europe in foreign ships are subject to additional duty; also from European countries and "entrepots," whatever be the mode of transport, of 3 francs 12 centimes per 100 kilograms. Sugars for temporary admission are for refining in bond.	
Above No. 13 and not above No. 20.	91°, inclusive, to 98°, exclusive.	6 00			
Above No. 20	98° polarization or more	6 13			
Temporary admission:							
Raw sugars below No. 7	4	Less than 76° polarization	67½			
From No. 7, inclusive, to No. 9, inclusive.	3	From 76°, inclusive, to 86°, exclusive.	80			
From No. 10, inclusive, to No. 14, inclusive.	2	From 85°, inclusive, to 92°, exclusive.	88			
From No. 15, inclusive, to No. 18, inclusive.	1	From 92°, inclusive, to 98°, exclusive.	94			
All above No. 18	98° or more	97			

Table giving synopsis of the laws regulating the duties on the importation of raw sugars and the exportation of refined sugars, &c.—Continued.

HOLLAND AND BELGIUM.

Classification by the Dutch standard.	Number of class.	Classification by the polariscope. Degrees of saccharine strength.	Rate of duty per 100 pounds, reduced to United States currency.	Effective remolument of leaf sugar for 100 pounds.	Drawback of bounty allowed on sugars exported.	Rate per 100 pounds, United States currency.	Remarks.
Raw sugar below No. 7, Dutch standard.	4	\$3 00	67	On dry, hard, and translucent candies.	\$4 80	The quantity of sugar liable to duty, in both Holland and Belgium, is estimated on the density of the beet-juice.
No. 7 and not above No. 9.....	3	3 60	80	Well clarified, hard, and dry leaves, and rectangular pieces.	4 50	
No. 10 and not above No. 14.....	2	3 94	88	On native raw sugar, No. 11 and above.	3 94	
No. 15 and not above No. 18.....	1	4 20	94	On native raw sugar, from No. 8 to No. 11.	3 60	

GERMANY.

On all sugars above No. 19, Dutch standard.	\$3 25	On all raw sugar below 80°.....	\$2 07	Produces all the sugar wanted for consumption from beet-root. Duty levied on estimated weight of beet-roots.
On raw sugars below No. 19, Dutch standard.	2 60	On refined, hard, full leaves, &c.	2 50	
					On refined, not less than 98° saccharine matter, or more than 1 per cent. moisture.	2 33	

AUSTRIA.

On refined sugar and sugar candy.....			\$6 00	On refined sugar above 99°.....	\$2 45	Produces all the sugar wanted for consumption. Duty estimated on capacity of apparatus for refining certain amount of roots in twenty-four hours.
On white crystallized.....			4 16	On raw sugar above 90°.....	2 00	
On raw sugar.....			2 80	On raw sugar below 90°.....	Nothing.	

Statement showing the quantity, rate, and amount of duty collected thereon on all sugars imported into the United States from 1867 to 1880. Also, the amount of refined sugar exported for benefit of drawback from 1870 to 1881. This statement does not include sugar from the Hawaiian Islands from 1876 to 1880.

[Prepared from estimates of Bureau of Statistics, United States Treasury Department.]

Fiscal years.	Pounds.	Foreign market value.	Average value per pound.	Amount of duty paid.	Average duty per pound.	Average duty per pound received from 1876 to 1881, including 25 per cent. additional duty.	Rate per cent. on an ad valorem estimate.	Comparison made with the years 1867, 1868, 1869, and 1870, which shows an average of 3.04.		Gain to the revenue by sugars being less colored.	Refined sugar exported for benefit of drawback.

TREASURY DEPARTMENT,
Bureau of Statistics, November 8, 1881.

I hereby certify that the figures in columns 2, 3, and 5 of this statement have been examined in this office and found to be correct.

JOSEPH NIMMO, JR., Chief of Bureau.

REMARKS.

Rate of duty from 1862 to 1870.

	Per pound.
On raw sugar not above No. 12, Dutch standard	\$0 03
On raw sugar above No. 12, and not above No. 15, Dutch standard	03½
On raw sugar above No. 15	04
On refined sugar	05

New tariff took effect January 1, 1870.

	Per pound.
On tank-bottom sirup of sugar-cane juice.....	\$0 01½
Melada, concentrated melada, and concentrated molasses	01¾
Sugars, all not above No. 7, Dutch standard in color	02
Sugars, all above No. 7, and not above No. 10	02½
Sugars, all above No. 10 and not above No. 13	02¾
Sugars, all above No. 13 and not above No. 16	03
Sugars, all above No. 16 and not above No. 20	03½
Sugars, all above No. 20	04

Twenty-five per cent. added to the above schedule after July 1, 1875, by act of Congress, March 3, 1875. Sugars seized by special Treasury agent in Baltimore as artificially colored November 21, 1877. Decided so by jury after seven weeks' trial in the United States district court, Baltimore, November 21, 1878.

Classification of certain kind of vacuum-pan sugars by the polariscope, directed by the Secretary of the Treasury, September 2, 1870.

Neither duty assessed nor classified by polarizing included in this table.

Respectfully submitted.

S. E. CHAMBERLIN,
Special Agent U. S. Treasury Department.

By Commissioner GARLAND:

Q. What is the extent of adulteration by the use of glucose, &c., in the refining processes?—A. I think, perhaps, 8 or 10 per cent. has been determined by chemists as being artificial glucose; that is, glucose from substances other than cane.

Q. Would that apply to sugar generally?—A. Coffee sugars, and that class.

By Commissioner AMBLER:

Q. Are they able to adulterate granulated sugar?—A. Yes; it is a mere matter of admixture.

By Commissioner UNDERWOOD:

Q. If the polariscope was adopted and the duty laid according to the strength of the sugar, would that entirely relieve all this difficulty about adulteration?—A. Yes, since the polariscope at once determines the saccharine strength.

Q. After the duty was laid upon it, the adulteration in this country would make no difference to the government in revenue?—A. Not at all, except upon sugars for export.

Q. If it was to be exported would not the polariscope still show what the true crystallization was?—A. Yes.

Q. Would not the law upon that subject be based upon the use of the polariscope?—A. Yes.

Q. Have you seen any sugar made from sorghum?—A. Yes.

Q. Is that equal to the sugar made from sugar cane?—A. Yes, for sugars of that low character; I mean of that color. They have not yet reached that degree of perfection in its manufacture that they have in the sugar from sugar cane. I think I have seen here some of the best samples of sorghum sugar that have been made in the United States.

HENRY McSHANE.

BALTIMORE, MD., *September 29, 1882.*

Mr. HENRY McSHANE, of the firm of Henry McShane & Co., of Baltimore, New York, and Brooklyn, iron, brass, and bell founders, made the following statement:

GENTLEMEN OF THE TARIFF COMMISSION: Accepting your invitation extended to manufacturers of Baltimore to express their views on the tariff laws of the United States in their bearing and effects on diversified interests in this country, I do myself the honor to address you on the subject.

I regret that the shortness of the time, and the pressure of my other duties have prevented me from collecting and tabulating statistics applicable to the subject (which, however, are available to you), so I shall confine myself to defining my opinion, formed by close observation and the experience of nearly thirty years in manufacturing.

I am engaged in this city making church bells and also brass and iron goods used in plumbing and steam fitting. The chief metals which I use in making my goods are copper and iron, both of which are protected under present revenue laws, both having a specific duty, the former of 5 cents a pound, and the latter \$7 a ton. In the manufacture of goods in which I use these metals I employ over 500 hands, all males, and disburse in wages yearly nearly \$200,000. I melt annually, say 5,000 tons pig iron (both foreign and American) and nearly 1,000,000 pounds of copper (all American).

In developing and managing this industry I have traveled throughout this country, Great Britain, and the West Indies, and have enjoyed the acquaintance of gentlemen managing the largest manufacturing concerns in those countries. All the conversations and discussions into which I have been drawn on the tariff question have tended to establish a conviction in my mind that our present growth in wealth and population is mainly attributable to the protection given to our capital and labor in the work of developing and utilizing within ourselves the natural resources of the country; and I believe that the same protection must be continued for our iron industries until competition amongst American producers of iron goods, and other internal causes, bring about a parity of prices in England and America.

If social conditions and the value of capital and labor were the same in this country during its early history as prevail in Europe generally, and in Great Britain in particular, the fundamental law of commerce would induce a free interchange of commodities between the old and new worlds with mutual benefit, for the same reason that free commercial intercourse exists between the different States in the Union, which are on a common basis and have common interests as against the rest of the world.

Nature favored us in adopting a course of self-advancement which is exceptional, and the policy known as the American tariff system which we formed was one of the grandest conceptions in its results which could be devised. Nearly sixty years ago the tariff measure first became a law; statesmen foresaw its magnificent effects and designated it as America's second declaration of independence of England—the first being political and the second commercial.

A new country like this, with inexhaustible natural resources to be developed, but with limited capital and population, could never thrive unless a barrier was erected against outside competition having ample and cheap capital and a semi-pauper population at command. Were it not for protective customs duties the United States would not have made such gigantic strides in progress as have excited the wonder of the world, but would have yet the same condition as other new countries which are mere colonies tributary to Great Britain, supplying her with cheap materials and food and taking in return her manufactures. The crude products of the earth add little to the prosperity of a country in comparison with its manufacturing interests. I regard the American system of protection the most valuable plan which could have been devised to promote manufacturing and for the advancement of our country from a colonial position to the first rank amongst nations in a little more than half a century.

The tariff bill placing duties on foreign articles formed a premium to induce people in this country to engage in manufacturing, has increased wages and home comforts and thereby attracted immigration thither, and as we possessed all the requisites of food and material within our midst we have retained the annual accretion to our capital.

Under protection we not only have developed our mineral and other natural resources, but the cost of preparing the same for consumption is spent in our midst, thus affording employment for large urban populations forming a basis for taxation and aiding the advancement of civilization.

The new world, where so much had to be done and having its energy expanded and encouraged by protection, naturally became a great field for labor, causing workmen to be in demand and well paid, thus producing ample remuneration to cover not only the necessaries but the comforts of life, and affording opportunities to the masses for mental improvement. From protection to our manufactures naturally arose that spirit of ingenuity which led to the adoption of our patent laws, protecting the inventor among ourselves and placing us foremost among nations as mechanical constructors.

To arrive at an equitable scale of rates of duties is a perplexing problem, because of the conflict of interests which exists in a large country like this, containing, as it does, a great diversity of industries. The only rule which I could suggest is to maintain prohibitory rates on such foreign products as have a value in their home market below that of our similar domestic productions, especially when the market prices of said articles in this country are created and regulated by healthy competition between American producers. The difference between foreign and domestic prices is principally caused by the discrepancy between European and American rates of wages, and although the purchasing power of the skilled or unskilled workman's compensation is greater abroad than with us, yet it does not afford him the same comforts enjoyed by his fellow workman in this country.

Iron, in all its forms, is the basis and indispensable auxiliary of all manufactures, and its modern applications have made possible modern civilization; hence much of the comforts of life enjoyed in this country is attributable to the protection of iron industries which employ directly and indirectly a very large share of our population. If my theory be correct, protection will eventually cease to have a mission to accomplish when competition between our home producers reduces cost to a parity with Europe. But with our immense territory yet to people and develop,

I think it well to hold to our tariff laws until overproduction in our midst renders them unnecessary or inoperative.

Pig iron, and everything into which it enters, must yet be protected, for notwithstanding the gigantic growth attained by our iron industries, the improvements made in its manufacture with us, and the sharp and bitter competition existing between its producers during the recent period of depression, yet it has not declined to the normal prices of iron in England, mined and worked by an over-crowded population. During the panic, when firms were breaking and workmen were only getting 90 cents and \$1 per day, I never paid less than \$18 and \$19 for No. 1 American pig after inviting competition; and in England now, where there is unusual demand and consumption existing, similar grades of iron are sold for \$14 and \$15 a ton against \$25 to \$27 now ruling here. If our lowest point in disastrous times was only \$18, how could our producers now face such competition, when English and Scotch iron can be laid down in our ports at that price were the duty removed?

I regard the present duty of \$7 a ton on pig iron not sufficient, for despite of it, foreign pig obtains a market here and draws from the wealth of this country annually. It is fresh in our minds that in 1879, when a sudden and unprecedented demand arose with us and found us short of stock, foreign iron poured into the country from every quarter of the globe and flooded it, sweeping over our productive duty and carrying away from us millions of dollars. This incident may not be repeated, but taken with the fact that foreign iron steadily obtains sale in the United States, it is evident that the present duty is not prohibitory. Again, it may be advanced in favor of a duty that it offers encouragement to further development of our mineral resources, and any policy of decreasing it would produce distrust and destroy confidence amongst manufacturers of iron goods.

I believe if we continue to protect our iron and coal mines a short time longer we will be able to produce iron goods as cheaply as England, and yet keep the workman in an independent condition, because of our abundant and well-located supplies of these minerals. At present, however, I rather favor an increase in duties on iron so as to prohibit the importation of Scotch and English metal, for as long as we have plenty of business amongst our own countrymen I favor keeping off outside competition and paying our workmen far better wages than is earned abroad, because the more money which passes through the workman's hands (the greatest consuming class) the greater is our general prosperity, and this can only be done by keeping out of the market the products of cheaper labor which take capital out of the country.

The character of my productions in iron is such that I am, as a manufacturer, removed above the effects of the results of the abolition or reduction in the tariff on pig. The only injury I would sustain in common with others in my line using iron being, as far as I can see, the decreased consumption of plumbing material in and about the houses of mechanics dependent on living prices for iron goods; these having to work at prices ruling in Great Britain would have to live as inexpensively, which means living unaccustomed to improved sanitary and hydraulic improvements, which are enjoyed in this country by the humblest house-keeper. As far as concerns foreign competition in making my goods, at present, at least, I could successfully meet English makers after paying the higher cost of labor and metal, simply because we offset these advantages by labor-saving machinery unused in England, which they find difficult to get their workmen to adopt.

The drawback to exportation of our products used in plumbing is the

poverty of the masses outside of North America, who must be content with comparatively rude and inconvenient sanitary arrangements. Skill in manufacturing iron goods, especially machinery, has contributed more to the advancement of civilization than any other material factor, and the leading position attained by the United States as the most comfortable and the favorite home for the masses is attributable to the protection given to iron manufacturing.

Pig iron is the chief factor in this country's prosperity; to maintain or increase its duty offers encouragement to development, and any policy favoring a decline would cause serious business depression effecting all; hence I beg of you to at least continue the present rate on iron, and when we reach a production which will be more than our consumption, we will then have to resort to exportation for our supplies in face of English competition. Continue ample and prohibitory protection for iron until the law of supply and demand renders it useless.

The other metal in which I am interested is copper, which I believe has been protected long enough, as it is now an article of export with us. The mining companies resort to exportation annually in order to maintain high prices at home. By so doing they simply make consumers of brass goods pay into their pockets the difference between London and New York prices. If this difference was spent in wages amongst the miners it would be no loss to the public, but the difference of several millions dollars takes the shape of profits for a few wealthy families. It is a conceded fact that copper can be mined in this country and laid down in New York at 11 cents a pound with profit to the mining companies, yet these companies, at a time when they were commanding 19 cents in New York, delivered a large quantity free in Havre at 16 cents. I submit the following statistics:

Ingot in London is selling to consumers at from 15 $\frac{3}{4}$ to 16 cents.

Ingot in New York is selling to consumers at from 18 to 18 $\frac{1}{2}$ cents.

Imports of copper, ingots and pig, into port of New York, for years 1874 to August 1, 1882.

	Pounds.
1874.....	684,249
1875.....	138,634
1876.....	128,897
1877.....	87,418
1878.....	73,718
1879.....	646,295
1880.....	491,854
1881.....	425,886
1882.....	257,505

Exports of ingots and pig copper from port of New York, for years of 1874 to August 1, 1882.

	Pounds.
1874.....	8,309,596
1875.....	7,437,382
1876.....	16,192,529
1877.....	11,488,145
1878.....	13,337,623
1879.....	13,613,519
1880.....	2,318,761
1881.....	7,029,554
1882.....	1,909,361

This is the *modus operandi* of the famous lake companies for many years, making a bonus equal to the duty of 5 cents a pound out of the American consumer. All American copper production above domestic

demand finds a European market despite of English competition, and at lower prices than England can touch on copper imported from her tributaries. The brass manufacturers of this country can successfully compete against European rivals, and it is to be regretted that so large an industry is restricted in its export business by being handicapped with a duty on its chief metal, which duty only benefits a dozen or two of people. If I had copper as cheaply as England I could find sale for many thousands of dollars worth of bells and other brass goods in foreign countries annually, giving employment to an increased proportion of workmen in this country. I would be glad to see copper placed on the free list, as it is an article on which very little labor is expended, and it enters into brass compositions for mechanical purposes which absorb a vast amount of labor in their application. I am sure cheaper copper would create more wages to the workmen of New England and add to the volume of our exports. Should you not deem it advisable to report favorably on free copper, I can console myself with the belief that the day is near when our copper resources will be so fully developed that home competition between the Lake Superior and various Western miners will bring copper in New York below parity of London and will be exported extensively. In the case of copper I believe the expedient of protection has accomplished its object and now aids monopoly, but this evil in its turn will produce good by stimulating production, until finally the inevitable law of supply and demand will govern our copper market, and America, by reason of her greater mineral and food resources, will have cheaper, instead of dearer, copper than Europe.

I have endeavored to define my views on protection as a sound measure for our country. I believe that time will ultimately remove its practical operation by causes from within ourselves. There is another question which should have the careful and immediate attention of our government, as we will never be in an independent commercial position until it is properly settled. I allude to American shipping. We should build and man the vessels leaving our ports. Were we equal with England in all other respects, she would far outstrip us commercially, because she does the carrying trade and banking business between us and our customers. I favor the passage of laws, not to encourage the purchase of foreign ships or their transfer to our flag, but to induce us to build them *ourselves* of American material, and, after launching them, to exempt them from onerous taxation, grant them liberal mail contracts, and treat them as liberally as the railroads, which have received large premiums in the form of land grants; in fine, using every means of encouragement for our shippers (removed from danger of fraud) which we can devise. A competent and adequate corps of consuls to aid individual enterprise in foreign markets is also necessary, and if we get ready in this manner to do a foreign trade it will then be time to remove our protective duties, because as we are we would not be able to meet England in the markets of the world. She has the commercial machinery under her control, and our first step to secure an equal footing is to build a merchant marine, which I believe indispensable to us alike in times of war as in the time of peace; and indeed our great sea-coast should cause us be the greatest maritime power in the world. I also suggest encouraging the manufacture with us of silks, wines, and other luxuries, for which we draw so heavily on Europe, and thus further aid our home industries and cause the retention of capital in our midst.

The cost of tank iron, ship iron, &c., when the country was running

on a low tariff, from 1850 to 1860, was 25 per cent. greater than it is to-day, as can be substantiated by papers published in those days. People have a very erroneous opinion about this tariff question. Why was it greater? The answer is simple. We had very few mills existing in our country during those ten years, and England had an enormous trade with us. When she found that she had this tremendous trade with us, her manufacturers put up the prices of iron 25 per cent. greater than they are to-day.

By Commissioner AMBLER :

Question. Will that remark apply to all classes of iron?—Answer. Yes; to all classes of iron. Twelve or thirteen years ago we produced annually a few thousand tons of steel rails. The cost of them then, laid down at an English port, was about \$87 a ton. We kept on increasing our production annually, until now I suppose the annual production of steel rails will exceed one million tons; and whereas the price of them some twelve or thirteen years ago was \$90 or \$95 a ton, to-day they are \$45 a ton. The cause of that reduction in price is the competition among our own manufacturers. When we had no rail mills in this country the English manufacturers put up the price in England.

By Commissioner MCMAHON :

Q. Do you recommend any change in the tariff on iron ore?—A. Yes, decidedly.

Q. Do you recommend that iron be put on the free list?—A. No, sir.

Q. What change would you recommend?—A. I would recommend about \$1.50 to \$2 a ton on iron ore. There is a stock coming here that is well calculated to throw out of employment hundreds of thousands of people.

Q. And you think the copper-ore business is so well established that there is no danger to be apprehended from putting that on the free list?—A. No, sir; I am credibly informed that the mines of Arizona are far richer than the mines of Chili, and it is only a question of a few years when those mines will be largely developed, and then our people will export copper extensively to Europe and contend with the Chilians for the markets of Europe. That is certain to come to pass within the next few years.

By Commissioner PORTER :

Q. Is the amount you give for 1882 for the entire year?—A. Up to August only.

Q. I would like you to explain the great fluctuation in the exports from thirteen millions to two millions.—A. That was due to the great consumption in this country, which required that amount to take it off the market.

By Commissioner AMBLER :

Q. That is to say, they only exported the surplus?—A. The surplus production.

Q. What years were those when the exports ran up so high?—A. Those were the years of great depression; we unloaded on Europe. Our copper ore always has a market there, because it is superior to anything they produce in Europe. It is the native copper found in the Lake Superior mines.

Q. While the Chilian copper is sulphuret?—A. Yes; and so is the Arizona and Montana copper.

EMIL E. CARL.

BALTIMORE, MD., *September 29, 1882.*

Mr. EMIL E. CARL, of Baltimore, importer of vinegar, made the following statement :

An importer of vinegar at this port for the past twelve years, and having called the attention of Congress last year (see inclosure) to the defects existing in the laws governing the manufacture and importation of vinegar, permit me to state as follows :

The law passed March, 1879, sanctioning the use of alcoholic vapor for the manufacture of vinegar has enabled unscrupulous vinegar manufacturers to make a product which is driving the really pure imported vinegar, as well as the good cider vinegar of domestic manufacture, out of the market, leaving the doors open to fraud by enabling parties to make the alcoholic vapor obtained sufficiently strong to be sold as whisky, on each and every gallon of which the government loses 90 cents internal tax.

Theoretically, 1 per cent. of acetic acid (vinegar) requires about nine-tenths of one per cent. absolute alcohol by weight, or $1\frac{1}{8}$ per cent. of alcohol by volume.

This favorable result is, however, never obtained, owing to the loss of alcohol by evaporation. It is safe to say that $1\frac{1}{8}$ per cent. of absolute alcohol by volume does not furnish more than 1 per cent. of acetic acid.

A vinegar neutralizing 35 grains of bicarbonate of potassa requires at least 5 per cent. of absolute alcohol, and vinegar made of a fluid containing but 2 per cent. alcohol would only neutralize about 13 grains of bicarbonate of potassa. Consequently if in the vaporizing process the vapor used to manufacture vinegar is not allowed to contain more than 2 per cent. of alcohol (law of 1879), the domestic vinegar manufacturer cannot and does not make a vinegar saturating more than 13 grains bicarbonate of potassa. It follows, necessarily, that such manufacturers must and do use a vapor containing at least 5 per cent. alcohol to produce a 35 grain, and 16 per cent. or more to make 68 to 70 grain vinegar, from which the government does not receive any tax in any shape or form, directly or indirectly. In fact, such manufacturer is even exempt from taking out a license in the respective States local government.

The importer pays both license and the heavy duties, according to existing tariff laws, that is to say, 1 cent on every $3\frac{1}{2}$ grains, *i. e.*, for 35 grain, 10 cents; for 70 grain, 20 cents, and more in same ratio. The domestic manufacturer can produce and sell an article of 35 grain at 5 cents, 60 grain or more at 12 cents per gallon, including cost of barrels, and with a good paying profit.

The argument for protection made by domestic vinegar manufacturers, that it is meritorious to give to the people a cheap vinegar, becomes void, because the consumer pays about the same price now for vinegar made according to the vaporizing process, paying nothing to the government, as when the manufacturers had to use tax-paid alcohol; and often furnishing an unwholesome article, injurious to the health, because mixed with sulphuric acid to increase strength.

Vinegar can be made from spoiled wine, corn, malt, molasses, or beer mash, beets, and potato mash, by allowing the fermentation to continue

after the sugar contained therein has all been changed to alcohol, free from government tax and restrictions; and as the law now stands, even every farmer is suffering under its effects, being deprived of the chance to utilize the cider made from his fruit crop for vinegar, as has been demonstrated before the Committee on Ways and Means, in January, 1881, by a petition from all sections of the country.

Maintaining that the vinegar imported by me is of a superior quality and strength, and pays an enormous and prohibitory rate of duty, amounting to twice as much as the cost of production, its importation has brought to the government at this port alone, in the past years, the sum of twelve thousand eight hundred dollars annually, besides offering the people an article of unsurpassed purity and fineness.

Now, if either the duty on same would be reduced to 6 cents, as formerly paid, no matter what strength, or the present graduated duty so modified that instead of 35 grain as now paying 10 cents, 70 grains would be allowed to pay that duty, then the domestic manufacturers would be fully enabled to compete at a handsome profit with the imported vinegar of the same strength at a price of 8 cents per gallon.

R. W. S. RAISIN ET AL.

BALTIMORE, MD., *September 29, 1882.*

Mr. R. W. S. RAISIN, manufacturer of chemicals, Baltimore, Md., made the following statement :

On the part of chemical manufacturers of Baltimore City, I appear before you, asking for a protective tariff. The interest I represent is one of the largest in this State, and in the Southern and Western States. I respectfully submit the following communications, which I will read :

The large amounts of money that have been expended in the erection of costly leaden chambers for the purpose of the manufacture of sulphuric and other acids during the past decade throughout the United States, and especially in the more southerly sections, are proving to be very unprofitable investments, from the fact that our home manufacturers have no protection against foreign manufacturers of acids, and more especially acids that are obtained as biproducts of such materials as are not manufactured in this country; these waste acids are recovered by the foreign manufacturers, and are used in many artificial chemical compounds which are shipped to our American markets free of duty, and thus are put in competition with our home skilled labor and manufactures, and at such prices that brings about, as a result, the stoppage of the American manufactories. The construction of chemical works is expensive, and after they are constructed there is no other use to which they can be adapted than the one sole purpose of the manufacture of acids. Then, if these chambers are allowed to stand idle the wear and decay is greater on the works than if they were in full operation. The acids that are used to prepare the chemicals that are being imported free of duty really cost the foreign manufacturer nothing, being, as we stated before, a biproduct; and it does not stand to reason that the American manufacturers, with their expensive plant, large capital, and costly skilled labor, can compete with the foreign article that costs the compounder of artificial chemicals nothing. In presenting our petition to this honorable Commission, we do so without any reference whatever to any political bearing that in the past may have surrounded the great question of tariff or free trade. We believe that the great majority of our citizens, of the present day, honestly believe that the American manufacturer is entitled to protection upon the industries of our country; it must be acknowledged that owing to the high price of skilled labor in this country American manufacturers are entitled to protection against the cheap labor of Europe.

We beg to ask the attention of your honorable Commission to a fact not generally understood by many of the good people of this country, that is, the low sea freights obtained by our foreign competitors on the commodities shipped from Europe to this country. During the last decade we have found it a common thing for heavy goods to be imported from England and Germany at very nominal freights, in many instances one or two shillings per ton, and in cases we have known of a whole cargo being brought as ballast, whilst if a manufacturer in Norfolk wishes to ship a cargo of similar goods from Norfolk to Savannah, Ga., he cannot do it at a less cost than from \$2.50 to \$3 per ton, and yet the English manufacturer can load a cargo in Liverpool for Savannah at a sea freight of from 50 cents to \$1 per ton, and pay no duty on the materials shipped to our markets. We therefore beg that your honorable Commission will give to the American manufacturer of sulphuric and muriatic acids such protection as in your judgment you think the American trade is entitled to.

JOSHUA HORNER, JR., & Co.

The manufacture of sulphuric acid has grown to be a business of great magnitude. In the city of Baltimore alone more than forty chambers have been erected, at a cost in construction of millions of dollars, and similar investments have been made throughout the United States. Equally large works for this business exist in Charleston, S. C.; Wilmington, N. C.; Atlanta, Ga.; New Orleans, La.; Port Royal, S. C.; Richmond, Va.; Augusta, Ga.; Saint Louis, Mo.; Wilmington, Del.; Chicago, Ill.; Buffalo, N. Y.; Camden, N. J.; Seaford, Del.; Cleveland, Ohio; New York, N. Y.; Newark, N. J.; Philadelphia, Pa.; Booth Bay, Me.; Ridgefield, N. J.; Wood's Holl, Mass.; Brighton, Mass.; Weymouth, Mass.; Roxbury, Mass.; Boston, Mass.

These extensive bee-hives of industry have for years gladdened our ears with the

musio of their machinery, and supported many thousands of employés and their families, and would still continue to prosper but for the fact of Europe pouring in, free of duty, upon the United States compounds containing these acids. These imported articles are obtained as a side product, and are not made as in this country, as a separate business requiring immense outlay for plant, upon which we pay taxes imposed to maintain our government. In Baltimore alone fully one-third of these investments are now idle, whilst the imports of the European articles have increased in five years from a few hundred tons to 75,000 tons in 1881, and the price of sulphuric acid has consequently fallen from \$1.25 per 100 pounds (a fair living profit) to 55 cents per 100 pounds (a ruinous loss); and the importation of the European compounds continues to increase year by year—paying no duty—and leaving our extensive works to decay and our laborers, who are skilled in this business, to remain idle or seek common labor, at half the amount of wages their experience in this business would demand with proper tariff protection.

We would therefore pray that you give to this industry a protection which is a necessity, and have Europe pay as contribution to our income a reasonable sum for sending her refuse materials free of duty and under assumed names to this country.

ROBERT OBER,

President.

By the PRESIDENT:

Question. What amount of duty do you ask?—Answer. Thirty per cent. ad valorem.

The abolition of slave labor at the South has rendered necessary increased facilities for agricultural purposes, and among these has grown up a demand for first-class fertilizers to enable the farmers to make larger crops on less land and cause them to mature in a shorter period, and a most important element in the composition of fertilizers manufactured to meet this want, so vital to the best interest of the country, is sulphuric acid. Chambers for the manufacture of this acid requiring, as it does, skilled labor and chemical exactness, have been constructed at Augusta and Savannah, Ga.; Charleston and Port Royal, S. C.; Wilmington, N. C., as well as at many points north of these localities. Many millions of capital are invested and many thousands of hands employed in the production of this acid and the manufacture of articles into which it largely enters. These acid chambers, by reason of their peculiar construction, are useless for any other purpose than that for which they were erected.

This industry has been seriously injured and the profits rendered almost nominal by reason of the competition which has lately sprung up through the introduction of European goods into which this acid and its component parts enter. These foreign articles are now imported free of duty, and coming as they do in large quantities as *ballast*, they are thrown upon our markets in large quantities, and whilst they would not supply the demand for first-class fertilizers called for by the agricultural interest of the country, should the manufacture of sulphuric acid be discontinued in the United States at present prices, nevertheless the spasmodic and irregular introduction of these inferior goods seriously imperils this great and important home industry, employing so much capital and sustaining so much labor.

We therefore ask your honorable body to afford this great industry some degree of protection by fixing such reasonable duty upon these foreign importations as will at least prevent their sale at a price less than cost of manufacture in the United States. Otherwise this immense capital will be practically lost and many thousands of laborers now earning living and remunerative wages will be thrown upon the country to seek such employment as other more fortunate, but overeroded, industries may furnish.

Respectfully submitted.

M. A. STOVALL,
Georgia Chemical Works, Augusta, Ga.

Large investments having been made in Maryland, Virginia, Georgia, North and South Carolina, and other more northern States in "chambers" for the special manufacture of sulphuric acid as a component of fertilizers, they could not compete with

the cheaper products of England made from *waste acid of inferior quality*, and would be compelled to succumb, and thus destroy a large and useful industry, throwing a large number of our laborers, both white and colored, out of employment, and leaving our farmers ultimately at the mercy of English manufacturers, both as to prices and quality.

NAVASSA GUANO COMPANY,
DONALD MACRAE,
C. L. GRAFFLIN,
F. W. KERCHNER,
Of Wilmington, N. C.

BOSTON, *September 27, 1882.*

DEAR SIR: I can offer you acid phosphate per sailing vessel, in bulk, September-October shipment, 1,000 tons, 26 per cent. sol. phosphate, at 55s. per ton 2,240 pounds, and 1,000 tons monthly, October to January, f. o. b. in London. Analysis by Dr. Voelcker.

Payment cash, by banker's credit in London. Freight would not probably exceed 8s. to any northern port, and 10s. to 12s. to a cotton port.

Shall be pleased to have an order from you by early mail, and will cable it.

Yours, truly,

THOS. AUBIN.

Messrs. R. W. S. RAISIN & Co.

By Commissioner UNDERWOOD:

Q. Have you investigated the difference between the prices of labor in this country and in Europe, so as to be able to state about what the difference is?—A. Mr. William N. Allen, who is present, can speak from actual knowledge of the facts, as he is English born. A skilled laborer in this line of business in England would be able to get probably \$4 a week if he is an excellent laborer.

Q. What do you pay here?—A. \$15 a week.

Q. Are there large quantities of raw material (pyrites) for the manufacture of sulphuric acid in this country?—A. No establishment that I know of has been able to make sulphuric acid from pyrites of our own production. There is a large manufactory at Camden, N. J., and during the war pyrites were laid down there at \$8 to \$10 a ton.

Q. From Spain?—A. No; from America. Spanish pyrites can be used to some extent.

Q. Do you know that at Atlanta, Ga., they are using Georgia pyrites?—A. That has not yet proved successful.

Q. I think, if my memory does not fail me, that some gentleman informed me that they were using them very successfully now.—A. That is only an experiment, and the experiment has only been made for a few months.

Q. After you get the sulphur out, what is left is very good iron ore, is it not?—A. That depends upon the character of the pyrites used. There is not sufficient iron in the pyrites down here to make them valuable.

Commissioner UNDERWOOD. There is the Waldrup bed of pyrites, about 35 miles from Atlanta, in Paulding County, Georgia, to which I call your attention.

The WITNESS. I am not acquainted with that. I will state, however, that that would be entirely out of the reach of any of your petitioners.

Q. You propose to allow the raw material to come in free and tax the product?—A. I am not particular about that. There is no objection to a tax upon all.

BALTIMORE, MD., *September 29, 1882.*

WILLIAM N. ALLEN, of the firm of S. S. Allen's sons, manufacturers of phosphates, Philadelphia, submitted the following: -

The undersigned manufacturers of Philadelphia and vicinity embrace ninety chambers for the manufacture of sulphuric acid, capable of producing 130,000 tons of acid annually, costing at present low prices over a million and a half dollars. These chambers, which have cost a million dollars to build, are entirely useless for any other purpose, and the manufacture of the acid is a chemical process of great nicety and exactness, requiring skilled workmen accustomed to the operation. Similar works exist at many points throughout the United States, notably at New York, Boston, Buffalo, Cleveland, Detroit, Chicago, Saint Louis, Richmond, Charleston, Atlanta, &c.

The business of manufacturing the sulphuric acid and also a number of allied chemical compounds of which the acid is a necessary factor, embodying in all the investment of many times the amount of capital stated above and the employment of thousands of laborers, has been prosperous and would continue to flourish and increase, but is now suffering from the importation of cheap European compounds, into the manufacture of which sulphuric acid enters. These European products enter at present free of duty, and their importation has increased enormously in the past few years, until in 1881 it reached 80,000 tons, bringing the price of sulphuric acid here in many instances as low as 60 cents per 100 pounds, or less, which is below the cost of production, and involves loss on manufacturers here, rendering idle in the United States thousands of laborers and millions of invested capital. We therefore pray that you afford protection to our manufacturers by fixing a reasonable duty on the European products.

A committee of our people will be pleased to appear before the Tariff Commission at your session in Baltimore.

COE & RICHMOND.

These signatures comprise every manufacturer of sulphuric acid in Philadelphia and immediate vicinity, and their combined capital is more than \$25,000,000. They are very much interested in the subject. This petition was started at 30 per cent. ad valorem, in order to harmonize with the rest of our Baltimore friends. At the same time, if it is desired, for the sake of harmonizing, to make it \$3 for 2,000 pounds, I give my assurance that every signer of this petition will be satisfied with that amount. I have visited them all and know that they will be perfectly satisfied. That rate is what will be requested by the association of manufacturing chemists, I have understood.

By Commissioner OLIVER:

Question. Why do the manufacturers recommend an ad valorem duty?
—Answer. We do not recommend it specially; we would be fully as well satisfied with \$3 for a ton of 2,000 pounds. Only we have had no experience in tariff matters, and there is no organization among the manufacturers of phosphate of lime, and consequently it is very difficult to get them together to talk the matter over. They want protection, but they

have no fixed idea of what precise amount they do want, and they would be satisfied with \$3 on 2,000 pounds; in fact many would prefer it.

Commissioner OLIVER. I would suggest that you recommend a duty of so much per ton, and make no recommendation whatever as to the number of pounds in a ton, as 2,000 pounds is exceptional; the ton under the tariff is now generally recognized at 2,240 pounds.

By Commissioner McMAHON:

Q. You use the phrase in your petition, "acidulated phosphate of lime, ammoniated or otherwise"; is that a general commercial term?—
A. Acidulated phosphate of lime is a commercial term.

Q. Does it touch ammonia crude?—A. Not at all. No crude materials are affected by these petitions. We do not ask for any duty on sulphuric acid, but on chemical compounds. Peruvian guano will not be affected by any of these petitions. What we ask for is protection as manufacturers.

Commissioner BOTELER. One great want of the present tariff is simplification; general terms should be avoided in any new tariff, so that no mistake can be made.

The WITNESS. We have endeavored to use such terms in our petition as would admit of no misunderstanding whatever. We ask a duty of 30 per cent. ad valorem on acidulated phosphate of lime, ammoniated or otherwise.

Commissioner McMAHON. "Otherwise" is quite a general term.

The WITNESS. Any acidulated phosphate of lime then would cover it. That is the object sought to be covered, whether ammoniated or not.

I might add that 80,000 tons of those cheap European compounds were brought here in 1881, and we have since learned that there were actual shipments of over 90,000 tons last year, and some points we had no information from. So that there were undoubtedly 100,000 tons altogether brought in last year.

Another point that is not touched upon in any of these petitions is, that we consider at present that there is really a duty against us; for instance, in regard to leaden chambers. There is a duty on lead that enters into them, and the discriminations of the tariff are really against manufacturers of the American product.

Mr. S. L. LOOMIS. We wish to state that the names we have handed in to-day represent a capital of from \$90,000,000 to \$100,000,000.

BALTIMORE, MD., *September 27, 1882.*

Mr. H. C. JACKSON, of New York City, manufacturer of chemicals, read and submitted the following petitions:

The undersigned, manufacturers of New York and vicinity, state that the business of manufacturing sulphuric acid, and chemical compounds of which the acid is an important part, is being undermined by the importation of European compounds containing sulphuric acid at a lower price than they can be produced for in the United States.

It is respectfully recommended by your petitioners—manufacturers of sulphuric acid and compounds of which it forms an important ingredient—therefore, that acidulated phosphate of lime, ammoniated or otherwise, or any artificial chemical compound containing free phosphoric acid, be subjected to the payment of the duty applying thereto and designated in existing United States tariff as chargeable upon "chemical compounds not otherwise designated."

It is considered that a duty of \$3 per 2,000 pounds would meet the requirements of the case, and be in accordance with the views of the signers to this petition.

A PETITION THAT SULPHUR ORE OR PYRITES (CONTAINING OVER 45 PER CENT. OF SULPHUR) SHOULD BE ADMITTED FREE OF DUTY INTO THE UNITED STATES.

To the United States Tariff Commission, 1882:

1. Whereas all raw materials for the manufacture of chemicals and fertilizers should be imported free of duty not only to promote the employment of labor, but to encourage the production of manufactured products belonging to the chemical and fertilizer trades at the lowest cost.

2. And whereas the fertilizer and chemical trades of this country have hitherto been at a disadvantage as compared with European countries, owing chiefly to the high price and cost of making sulphuric acid from brimstone, which raw material has virtually been discarded in Europe in favor of pyrites or sulphur ore containing over 45 per cent. sulphur, for the purposes of acid manufacture.

3. And whereas sulphuric acid can be made more cheaply from pyrites or sulphur ore containing over 45 per cent. sulphur than from brimstone, provided such sulphur ore is sold at reasonable prices.

4. And whereas Spanish sulphur ore—to the free importation of which the success of the chemical and fertilizer trades in Europe is principally owing—is, so far as this country is concerned, burdened by a considerable duty, 20 per cent. ad valorem.

5. And whereas brimstone is allowed to be imported free of duty.

6. And whereas the free importation of Spanish sulphur ore containing over 45 per cent. of sulphur will, to the extent of the present amount of duty, reduce the price of such raw material in this country.

7. And whereas the removal of such duty on such Spanish sulphur ore containing over 45 per cent. sulphur will not interfere with the development of similar pyrites or sulphur ore deposits in this country, such deposits of similar ore not having been worked to any great extent.

8. And whereas the copper contents of such sulphur ores containing over 45 per cent. sulphur range very low, from half of one per cent. to three per cent. only; and whereas such copper contents cannot be realized until after much labor and expense have been brought to bear thereon.

9. And whereas the removal of such duty would, both directly and indirectly, benefit the fertilizer, chemical, and oil industries, as well as the labor and agricultural classes of this country.

10. Now, therefore, the undersigned manufacturers petition that pyrites or sulphur ore, containing over 45 per cent. sulphur, should, like brimstone, be admitted free of duty.

Signed by—

Staten Chemical Company, limited, Elizabethport, N. J., sulphuric acid and chemicals. Capital represented, \$250,000.

Clark's Cove Guano Company, Dartmouth, Mass., sulphuric acid. Capital represented, \$250,000.

Read & Co., New York, fertilizer manufacturers. Capital represented, \$150,000.

Bowker Fertilizing Company, R. C. Davidge, general agent, New York, fertilizer manufacturers. Capital represented, \$600,000.

Total amount of capital invested by the preceding four firms, \$1,250,000.

Seal, Lawson, Kessler & Co.

NOTE.—Owing to this petition having only been prepared on September 28 with a view to being presented at Baltimore on September 29, 1882, there has not been time to obtain other signatures, but a further petition is being prepared and signed in favor of this important matter.

New York, September 28, 1882.

By Commissioner PORTER:

Question. Can you present any statistics in regard to wages paid?—
Answer. No, sir; I have no statistics, but, roughly speaking, I suppose

there is a difference of about 50 per cent. on unskilled labor between the wages paid in this country and those paid in England. As to skilled labor, it is exceedingly difficult to say. It ranges in this country sometimes to the extent of 300 or 400 per cent. greater than that of England, dependent of course upon the supply and demand.

Q. That is merely your general impression?—A. Those are the results of my knowledge of labor in the respective countries.

By the PRESIDENT:

Q. Have you personal knowledge of the value of labor abroad?—A. Yes.

By Commissioner McMAHON:

Q. What proportion does labor bear to the product?—A. In connection with the manufacture of sulphuric acid from pyrites, labor forms a very considerable item. The proportion of labor is about 18 to 20 per cent. of the total cost of the manufacture. The cost of the sulphur is about 60 per cent.

By Commissioner OLIVER:

Q. We were told in Richmond yesterday that there were large and inexhaustible quantities of pyrites in Virginia and in West Virginia, easy of access.—A. I am very glad to hear it. I can only trust that they will be developed, and it is a great pity that they have not been developed before. Anything by which the acid manufacturers of this country can get their raw material cheaper than they can get it to-day is certainly a very important matter.

Q. Do you think that there is any probability of it being developed if Congress would accede to your request and place the articles on the free list?—A. That all depends upon whether the quantity is so large, the quality so good, and the access to it so easy as has been represented. There are deposits in New England, at Milan, N. H., and at Charlemont, Mass.; there are deposits also near Atlanta, Ga., and some in Virginia.

By Commissioner BOTELER:

Q. In connection with the information we had yesterday at Richmond about deposits of pyrites in Virginia and West Virginia, we were told by gentlemen conversant with the facts, that if the tariff was reduced it would be disastrous to their interests and prevent that which you seem to think is desirable. In that view, do you think it well that the manufacture should be made to depend entirely upon the foreign article?—A. No, sir; though it appears to me that it would be a very good thing for the manufacturers. It is a question which is the more important, the manufacturing interest or the interest of the owners of these pyrites deposits? If pyrites are admitted free there is no doubt the manufacturers would get the benefit, and, if they are not admitted free, the price is so much higher to the manufacturer, so far as I can see. If the cost of mining is too great it would certainly be against their interest.

By Commissioner GARLAND:

Q. I understood you to say that if they are admitted free the manufacturers would be benefited. What effect would it have upon the consumers?—A. The ultimate effect upon them would be that the manufactured products would be so much the cheaper.

Commissioner OLIVER. I put the question to you because the statement of the manufacturers was that there were no deposits of any

moment developed in this country, and that they had to depend upon foreign supplies.

The WITNESS. The development so far is very small. The consumption of pyrites in other countries is very large, and there is every indication that they will ultimately take the place of brimstone in this country. So that the consumption of pyrites will be enormous, but enormous because it is a low-priced material.

By Commissioner BOTELER :

Q. Can you approximate the amount of the present annual consumption of pyrites in this country?—A. I should say about 40,000 tons; a very large proportion of it is Canadian pyrites.

Commissioner PORTER read the following letter, which was ordered to be printed in connection with the foregoing petitions :

BOSTON, *September 27, 1882.*

DEAR SIR: The main objections to, or, in other words, the unfairness of allowing fertilizers to come from England free of duty are these: If we purchase sulphate of ammonia from England to put into our fertilizers we are obliged to pay a duty of 20 per cent.; we are obliged to pay 2 cents per pound on each and every pound of lead which we use in building our acid-chambers; the same is true to a certain extent so far as iron is concerned; in a word, an acid-chamber costs 70 per cent. more in this country than in England. When this is considered, and then the fact that all ammoniates coming to this country in manures come free, but whenever they are imported separately we have to pay duties, it is readily seen that we cannot compete with the English market; hence, if England is allowed to import goods free of duty we at least should have the privilege of importing lead and sulphate of ammonia and other ammonia materials free of duty. If this cannot be done we must discontinue the business in this country unless a duty is imposed on imported fertilizers. We wish you would attend the meeting and indorse for us any measure that is brought up to promote the interest manufacturers of fertilizers in this country.

Very truly, yours,

WM. L. BRADLEY,
President.

LOUIS F. DETRICK, Esq., *Baltimore, Md.*

SILAS M. LOOMIS.

BALTIMORE, MD., *September 29, 1882.*

Mr. SILAS M. LOOMIS, manufacturer of palmetto fiber, Fernandina, Fla., made the following statement :

I represent an entirely new interest. For many years every attempt to produce fiber from the palmetto, which grows so abundantly in Florida on the borders of the Gulf, was unsuccessful. It never succeeded until within two years. It is now found that palmetto has a very fine fiber which can be made available for many purposes, even for spinning and weaving. It is found that it will work into woollen cloths to the extent of about 50 per cent., and experts are not able to determine whether it is all wool or part palmetto fiber.

At the very commencement of this industry, however, we found that bamboo, ratan, and cocoa fiber were sent in here free of duty at a less price even than we could get the palmetto cut with our cheap labor. What we wish, therefore, is that those raw materials should be taken from the free list and have a duty placed upon them. The duty should be from 1 to 4 cents a pound, 1 cent for that which is partly worked up into a kind of rope, and upon the fiber it should be put at 4 cents a pound. The manufacture has just commenced; it is not extensive, although there is quite a considerable capital engaged in it. Experiments have proceeded so far and productions have been made sufficient to prove that it is valuable material.

The palmetto fiber will make common matting superior to the cocoa matting. It makes all kinds of brushes. It will work into tapestry carpet, both back and front, at about 10 to 12 cents a pound, and make 50 per cent. of that material. It competes with jute, hemp, tampico, and almost all these foreign fibers that belong to the palmetto family. In this country we have ignored the whole palmetto crop in the South, because we could not get the fiber out. And now when we can get it out, it comes in competition with all these foreign fibers that are produced by cheap labor in different parts of the world.

By Commissioner BOTELER :

Question. Do you get it out by machinery?—Answer. Yes; we have now a single machine that will produce one ton per day. That one machine takes the palmetto and puts it through the first essential process to produce the coarse material. It then goes through other machines, and is worked down to an exceedingly fine fiber. The colored people, and also white people, to some extent, bring the material to the factory, and the price we have to pay them for that is so much that we cannot compete with the foreign articles.

So the tariff we propose is absolutely and solely for the benefit of the laborer. We have only been two years producing this, and during these two years the effort has been to see whether the machinery was a practical thing or not. Now, that is fully settled, and the machinery will produce a ton a day.

In Newark, N. J., they import bamboo (the fiber of which is almost identical with palmetto fiber) in little strips about 14 to 15 inches long,

and treat it chemically to bring it out into a kind of wool. You will see in the New York City Directory "Wool fiber," and under that you will see "Bamboo fiber"; that is for establishments of that kind. They have taken that bamboo wool, as they call it, to the mills in Massachusetts, and put it into beaver cloth, and put that beaver cloth out with other cloth, and directed attention to it; and the cloth which had the bamboo in it was not detected.

By the PRESIDENT :

Q. What effect would dampness have upon it?—A. I do not know. I have seen 45 per cent. of this bamboo fiber in what are called fur hats, and an expert thought it was all fur. I do not propose to ask the Commission to have this duty put on in order to bring this commodity in for fine work; that is not the point. What we wish to do is to produce the fiber in a coarse condition, say something like hair for mattresses, throw that to the trade, and let the trade work it up as they please.

By Commissioner OLIVER :

Q. Are there any other factories in the South besides yours?—A. No, sir; not now; but companies are organizing and proposing to go forward.

By Commissioner BOTELEER :

Q. Is it more durable than ramie?—A. Yes, sir.

Q. How does it compare in durability with jute?—A. I cannot say certainly in regard to that.

By Commissioner GARLAND :

Q. How does it compare with wool as to durability?—A. I don't suppose that it has been tested long enough to say positively whether it is as durable or not. We wish to put it in mattresses for bedding. That will take all that 50 factories can produce right along, taking the place of hair and husks, and all that sort of material. We do not wish to reduce it down any further. Cocoa fiber for matting is sold in New York for about 5 to 8 cents, according to quality.

By Commissioner AMBLER :

Q. What will your article cost?—A. Just about the same.

Q. What is your treatment of the material; is it chemical or mechanical?—A. It is mechanical entirely.

Q. The machine is one of recent inventions?—A. Yes. I think there have been about 200 attempts at machines for producing this fiber, but none of them, except the one I speak of, has succeeded in bringing it out practically.

By Commissioner UNDERWOOD :

Q. Is the material abundant and inexhaustible?—A. Yes; there are millions of tons of it; and in working it at Fernandina, I found that land which is considered worthless and which is burned over every year, being covered by this palmetto, would produce about \$80 to the acre for the raw material.

Q. Is it the small palmetto?—A. Both kinds.

Q. Could you not make cotton bagging out of it?—A. I think so; I have never made any; I have confined myself to reducing that leaf to a condition where other people can take it and go on still further. I only want to produce it in bales like the raw cotton, and let other people work it up.

By Commissioner AMBLER :

Q. Is it from the leaf you make it?—A. From the leaf and the stem of the leaf. The stem of the leaf is all sizes, from the size of your little finger to a foot long, and from the size of your wrist to 14 inches long. The average weight of the stems we are now using is about half a pound, and the average length of the fiber, as we get it out, is about 6 feet. That is put up in bales and sent to market. Bamboo for fish-poles is specified in the tariff act. I have no objection to its coming in free; but I object to bamboo, ratan, and coacoa coming in to be worked up as fiber. Bamboo is mostly imported from Jamaica, and coacoa from the East Indies, where labor is almost nominal.

WILLIAM PECK ET AL.

BALTIMORE, MD., *September 30, 1882.*

The following communication was read and ordered to be printed :

To the honorable Tariff Commission :

GENTLEMEN: The petition of your subscribers respectfully represents :

That we are glass-blowers, and workers in glass; that from the fruits of our labor we support our families. We are citizens of Baltimore, and as such are entitled to protection from the government. We therefore beg leave to call the attention of your honorable body to the following statements of facts, and ask, at your hands, such legislation as may secure to us justice, and such protection as was intended by the passage of the laws heretofore framed for the protection of the glass-manufacturing interests of this country.

The tariff laws of this country were evidently framed for the protection of the manufacturing interest, and the import duties imposed upon manufactured demijohns were wisely laid; yet the spirit of the law in this respect is constantly violated, and its essence nullified, by the practice indulged in by certain importers of manufactured glass, who cause to be shipped to this country demijohns of various dimensions, filled with vinegar or other fluids, either *low-dutiable* or *non-dutiable*, which on their arrival here, are emptied of their contents, and are then thrown upon the markets here, to the great disadvantage of our interests, and to the great detriment of the glass-manufacturing business of this country. Wine, beer, and all bottles, as also mineral-water bottles, are exempt from duty *as bottles*, and after being emptied of their contents are sold in the market here, to the detriment of our trade. And also, we are credibly informed that certain bottles, such as quart beers and wines, are brought here from Europe as ballast, and because of the duties upon manufactured articles (as ballast, being so low), are sold in our markets here at prices with which our home labor find it impossible to compete.

For these reasons, therefore, we trust your honorable body will recommend a redress of the grievances complained of, and your petitioners will ever pray, &c.

WM. PECK,
JOHN LONG,
JOHN WILLIAMS,
WM. EBERT,
JOHN SMITH,
Committee.

B. S. BENSON.

BALTIMORE, MD., *September 30, 1882.*

Mr. B. S. BENSON, of Baltimore, of the firm of B. S. Benson & Co., manufacturers of steam plows, addressed the Commission as follows:

I was in Fargo a few days ago, and learned that there was a petition being gotten up to take off the duty on steam plows. Being a manufacturer, and having invented a steam plow myself, I thought it well to oppose the motion to take off the duty. Now, after five years of hard labor, I have succeeded in making a plow that will plow 100 acres in 24 hours with 30-horse power. It has an attachment for burning straw and cutting off the stubble.

By Commissioner GARLAND:

Question. What is the price?—Answer. \$3,500.

Q. What is the price of the imported plow?—A. I could not tell; I have heard different prices stated.

Q. Is there any other factory besides yours in the United States for the manufacture of such plows?—A. No, sir.

Q. How many such plows are in existence?—A. One. I have made five different ones in improving it, and have spent \$20,000 to \$25,000. We propose to run this engine night and day.

Q. The steam plow that is imported from England is not moved by traction engines?—A. Yes, sir; when the machine moves across the headlands it is moved by a traction engine. I have succeeded in running my machine over the softest ground, where a horse could not go. Where a horse will mire, I will go over. The man who has the English machine in charge jumped off the cars at Fargo the other day and told me they were going to get the duty taken off.

By Commissioner AMBLER:

Q. To what extent are steam plows used now in the United States?—A. There are only two that I know of—one at Fargo, and mine here in Maryland. Mine will plow twice as much as that. I timed it and it plowed 17 acres and a fraction in ten hours.

Q. Where has yours been in operation?—A. Here on the Orange farm, close to Baltimore, and out to Relay. I had one there for two years.

Q. To what extent have you used it?—A. On 5 or 6 acres of land. It was only completed in August. We tested it and found that we could turn the corners of streets. I would not let it go to the public until we could do that. It is what is called an endless-chain traction engine. When I first went in the field we could turn on 1,000 feet; then we reduced it to 350, and now we can turn round in about 50 feet. It will run over the ground with about 15 pounds of steam.

Q. You plow with a traction engine?—A. Yes, sir; we plow a rod wide and 8 inches deep.

Q. When did you get it ready for final use?—A. About the first of August this year. As soon as I found it perfected I went to the Red River of the North to see the chances for using it there.

Q. The only trial has been here?—A. Yes, sir.

Q. You say that your plow will cost about \$3,500?—A. That is to be the retail price.

Q. Does that include the traction engine to draw it?—A. All complete; two sets of plows, breakers, &c.

Q. You have some idea of the cost of foreign plows?—A. I have seen notices showing that their cost was from \$5,000 to \$6,000.

Q. Did you see the English plow work?—A. Yes, sir.

By Commissioner BOTELEER:

Q. How does yours compare with English steam plows that are drawn from side to side of the field by stationary engines?—A. About \$3,500 for mine; and we can plow as much again as they can. Some grounds are much harder to plow than others, and unless we had the two plows at work in the same ground it would hardly be a fair test. I saw the English machine plow prairie stubble, and mine was on sandy soil in Maryland. I think that prairie soil was lighter than the soil here.

By Commissioner AMBLER:

Q. That is to say, yours would do more work there than here?—A. Yes, sir; but here they plow 8 inches deep; and out there they only plow 5 inches deep. That soil is kind of poison; if they turn up too much of it at first they lose their crops. There is a great desire on Red River to get steam plows—a perfect mania for them.

HORACE L. BROOK.

BALTIMORE, MD., *September 30, 1882.*

Mr. HORACE L. BROOK, iron manufacturer, of Baltimore, addressed the Commission as follows:

I do not think the duty is sufficient on pig iron. The average cost in this country, I suppose, is about \$19 to \$20 a ton—to be sure they can make it cheaper—while the raw material is not worth more than \$2; the rest of it is made up by labor, directly and indirectly, which would be about \$18 a ton. We all know that labor, especially skilled labor, in the iron and mining department is not more than half in England what it is here. The Pittsburgh puddlers struck for \$6 a ton, while in England the highest price for puddling is 7s. 6d., just about \$1.83, making a difference of nearly \$4 a ton in one department alone. There is not a single rolling-mill proprietor in this country who would not willingly contract for its total product for ten years to come at a profit of \$3 a ton.

A great many people say that all this talk of the manufacturers is for their own selfish purposes, and that it is not for the poor workingmen. I say it is for the workingmen, because the iron manufacturers of this country do not receive a large percentage on their investments; it has not been the history of the trade. The steel interest, to be sure, has made a great deal of money. The special duty passed by Congress upon steel rails brought about a very lively competition, and a production over and above the requirements of the country, which put the prices down from \$120 to \$40 a ton. If it had not been for these American works, the English would have control of the market, and instead of the prices coming down to \$40 a ton they would be held at \$80. At least, I think that is a fair surmise. I know of one concern that thought that \$2,000,000 was gone when steel rails went down to \$40, and they had to issue bonds to the extent of a million dollars, and sold these bonds at 80, to keep them from breaking. After that the boom came, and in this country every business was lively, particularly railroad building, which put up the prices of steel rails and enabled them to get through; but they have never made more than 8 per cent. on their capital.

Now, while I am uncompromisingly a protectionist, yet I do not want to be protected in any way which will injure any other American in his production or in his business. But in this section of the country there is a large amount of ore that cannot be worked alone. Within 70 miles of here, upon the Potomac on the Virginia shore, right across from the Baltimore and Ohio Railroad, there is a mine that ought to be furnishing labor to 200 men every day. But, on account of the large percentage of phosphorus contained in those ores, they cannot be used alone. They could be used, however, in connection with Spanish ores, in which there is almost a total absence of phosphorus. Our ores, especially the ores on the Atlantic coast, are largely impregnated with phosphorus. If you make iron of those ores alone, it could not be manufactured to advantage and would not sell. Take one-half of this ore and mix it with one-half Spanish ore, and the aggregate would be iron containing hundredths of phosphorus, which is considered a desirable Bessemer pig.

We contend that the introduction of these ores will benefit the ore interest of the country rather than injure it. There is very little labor in producing a ton of ore, which is really the raw material. If I were a Western man I do not think I should object to a low duty upon foreign ores; but, being of this section of the country, I should certainly recommend either a reduction of the duty or no advance.

The whole question of the different prices of the manufactured articles of this country and of Europe comes down to a very simple thing—the price of labor. There is not an article manufactured in the world that we cannot duplicate here, and make it cheaper than it can be made in Europe. But we do not think it desirable to put our labor upon that basis; we do not want to come in contact with labor so poorly paid. And then, again, I question whether we could make our mechanics work for such small wages, because we have too much land; and if they were not paid enough they would go to farming, and would raise not only what they now purchase from the farmer, but would actually come into competition with the farmer with products to sell. I am not yet an old man, but I have seen wheat overproduced, and I have seen it sell at 60 cents a bushel. Farm products can be overproduced just as well as manufactured articles, and I do not see, and never could see, why the interests of the farmer and manufacturer need not go hand in hand. If we want manufactures in this country, we must have a protective duty nearly equal to the difference between the price of labor in this country and that on the other side.

By Commissioner BOTELER :

Question. In the great variety of iron ores we have in this country, are there none that can be substituted for this Spanish ore, so free from phosphorus?—Answer. There are a few. There is one mine, the great Cornwall mine in Pennsylvania, and there are a very few in Alabama; I do not think there are any in Maryland; but there are some in Virginia, on the James River. The amount of such ore, however, is quite limited.

Q. If I am well informed on the subject, in regard to this Cornwall mine, it is the most remarkable in the country, if not in the world.—A. It is the greatest mine in the world.

Q. Would not that supply the demand in this State?—A. No; the ore from the Cornwall can be used in mixture only. It has too much sulphur, which makes the steel red-short; that is, brittle and easy to break to pieces. This ore that has the phosphorus in it you can work very readily when hot. If you start on a turnpike with a horse shod with shoes made of that kind of iron, you won't drive ten miles until you break every shoe, because the iron is rotten when cold. So that even with the Cornwall ore the foreign ores are necessary for mixing. The Spanish ores are unusually free from phosphorus, and contain no sulphur at all scarcely. The last cargo we received at a freight of 14s. per ton; that is about \$3.50. We have paid \$3.50 a ton from the Mediterranean, while pig iron was coming in here from England at 3s. a ton, simply because England takes our grain, while the people living upon the shores of the Mediterranean, in Spain and Africa, do not want our grain, and their vessels do not come here in ballast; consequently freight from there is higher. That will always be a protection to American ore.

By Commissioner GARLAND :

Q. Was not \$3.50 exceptionally high?—A. No, sir; 10s. is considered a fair freight; that is about \$2.50. I never knew any to be brought for less than 10s., and 14s. is the highest.

By Commissioner UNDERWOOD:

Q. Have you ever investigated the ores found in the neighborhood of Tellico Plains, in East Tennessee, near the North Carolina line?—A. No, sir.

Commissioner UNDERWOOD. There were iron works there thirty years ago, on a little stream called Tellico River. The ore is entirely free from both phosphorus and sulphur. A railroad is now penetrating that country from Marietta, Ga., and it might be of advantage to manufacturers to investigate them. The post-office is Tellico Plains, Monroe County, Tennessee.

The WITNESS. There is a great deal of ore in North Carolina that is of fine quality; it is free from both sulphur and phosphorus, and, in the old style of making iron directly from the ore, they made a very good quality of iron from it.

Q. Are you acquainted with the ores that are taken out at Anniston, Ala.?—A. Yes, sir; the pig iron contains about fifteen hundredths of phosphorus, and it would not do for Bessemer. It makes an excellent carbon iron. For ordinary purposes pig iron may contain one-half of one per cent. of phosphorus and make a very good iron, but it will not do for Bessemer.

Q. How are the Lake Superior ores?—A. They are very fine, indeed.

Q. Is there not enough ore in that locality to supply the American demand?—A. I do not know. The price has been very high. We have tried to get it here, but found it an utter impossibility. They have been able by combinations to get good prices at the mines, and that, together with the heavy railroad freights, prevents us from getting them.

Q. From the description I have had of the Lake Superior mines it would seem that there is enough there to supply any demand whatever; and then there are the lakes and the Erie Canal for transportation to New York and the ocean.—A. It has to be taken to the lake first by railroad, and then loaded in vessels, and then put on the railroad again and taken to Pittsburgh, or wherever the furnaces are.

Q. Suppose it was to go through the lakes to Buffalo, there take the Erie Canal to New York, and thence by water transportation by way of the Atlantic Ocean to Baltimore?—A. I am afraid the freight would be too great. We have to pay for freight on pig iron between here and New York \$2 a ton, although I have sometimes got it as low as \$1.50; and that is not a very great distance.

Q. Do not those high rates of freight result from the low state to which American shipping has fallen on account of the navigation laws and tonnage duties?—A. That is a point I am glad you have spoken of. Although I am not a shipper, and have never looked into the matter very elaborately, yet at the same time I think there is a very wrong impression about the injury done to the shipping interests by a protective tariff.

Q. I was not intending to intimate that opinion; but the navigation laws and tonnage duties, it is said, prevent the building of ships in this country.—A. Last spring one of our men, who had been a stevedore, told me that he had been unloading ore from an Italian vessel, and one of the sailors said to him: "What do you get here?" He replied: "Twenty cents an hour." The Italian sailor said: "Twenty cents an hour! That is all we get a day. We get our board, to be sure; but we only get \$6 a month." It is not the difference in the cost of vessels, it is the difference in the price of labor. If labor can be had for \$6 a month on

the one, and \$25 to \$30 a month must be paid on the other, the vessel that cost \$100,000 with cheap labor can beat the other vessel with the higher labor. So I contend that it is not the difference in the cost of vessels. I believe Mr. Roach can duplicate any of their vessels. But after you have got the vessel the charges are so great, and, above all things else, they get their labor so much cheaper.

Q. Over thirty years ago I read an article in De Bow's Review upon ship-building and sailors. The writer's opinion was that we could never have good sailors unless we had ships built at our own ports, for the reason that the ship-yards trained the sailors; and when a ship was built and took on board sailors, trained at that port, they came back from their voyages, like chickens to roost, to the port whence they sailed, to see their wives and children. Now, if we had American ship-building properly encouraged, a merchant marine and ship-yards, would not these coasting freights and all freights be immensely reduced?—A. I have no doubt of it; I think so. I think this government ought to take special interest in the ship-building of the country and ought to promote it. I would even go for a subsidy. Other countries give subsidies, and we cannot expect to compete with other countries unless we do as they do, to a certain extent.

By the PRESIDENT:

Q. You request a free admission of Spanish and African ores. It is your desire, as I understand, to obtain for the manufacturers on the seaboard some of the advantages for obtaining ores which those in the interior have?—A. Yes, sir.

Q. You speak of magnetic ore in Pennsylvania containing sulphur. Could not that sulphur be removed by roasting?—A. It is very hard to get rid of. They have put up mills and can remove a certain portion, but still that red-short character of the Cornwall iron has never been eradicated by any process they could put the ore through—that is, any practically commercial process.

Q. I have seen very highly sulphurous ores converted into admirable ores by roasting?—A. Yes; you can make them; but still it retains its red-short character too much to make a steel rail by itself.

Q. You spoke about the advantages of making rails in this country. Do you remember any expression of opinion from railroad men themselves in relation to the advantages of protection?—A. Yes; I have had frequent conversations with them on that subject.

Q. Do you remember any general statements of that kind signed by large bodies of railroad men?—A. Oh, yes, sir. In 1878, I think it was, when Fernando Wood wanted to reduce the tariff, I think there was a petition gotten up and signed by almost every prominent railroad man in this country requesting Congress not to reduce the duty on steel rails. The Pennsylvania Railroad Company signed it, the Philadelphia, Wilmington and Baltimore Railroad Company, and nearly all the prominent railroads. Mr. Garrett, of the Baltimore and Ohio, did not sign.

Q. The consumers of railroad iron themselves were in favor of protection upon the ground that their supplies of railroad iron were more secure?—A. Yes, sir. The iron works here are great feeders of railroads. Last year the Cambria Company paid the Pennsylvania Railroad over a million and a quarter dollars for freight. That is quite an item. We have got the money and labor here, and somebody gets it. If the railroads have to pay a little more for their iron, they get reimbursed in the freights they receive from those works, which otherwise would have to stop.

By Commissioner AMBLER :

Q. Your judgment is that putting these foreign ores upon the free list would not interfere with the ore interests in this country?—A. I think it would benefit them. If I thought for one moment that it would injure the ore interests of this country, I should advocate an increase of duty.

Q. Not being interested in ore, why do you assume that position?—A. Upon the broad principle of protection to American industry, and that alone. I believe that it would benefit me as well as others; but, even if it indirectly injured me, I would be in favor of it for the general good.

Q. That is to say, you regard it as being for the general good?—A. Yes, sir. If these ores could be brought from England in such quantities as they are brought from Spain, then I should say put on an increased duty, because the freight would be so cheap from England that it would be a great injury to our home mining. But, as I stated, the present condition will probably exist for years to come; that is, the Mediterranean people will never want any of our grain, or heavy products, which would take vessels over there, and, consequently, vessels could not bring ore here in ballast, as they do from England.

Q. Has there been any considerable importation of iron ores from England here directly?—A. No; there has not, because England is scarce of that very kind of ores herself, and takes them very largely from Spain.

Q. As I understand, the necessity for Mediterranean ores has reference to the making of Bessemer steel?—A. Yes, sir. I would also have it distinctly understood that it is not for that reason alone (because American people think that interest has been too greatly protected already), but on account of the Mediterranean ores being free from phosphorus, and it being necessary to mix them with our ores in order to make them marketable.

Q. Those Spanish ores are generally useful as neutralizing ores?—A. Yes, sir.

Q. Is it your experience here that there is \$18 worth of labor in a ton of pig iron?—A. We do not pay that. I have not gone into the question of railroad freights, indirect labor, and all that, very closely.

Q. In the first place you pay for the labor in producing the ore?—A. Yes, sir.

Q. And then there is the additional labor of manufacturing?—A. Yes, sir.

Q. Is it your impression that the labor would run up to \$18 on the average?—A. Yes, sir; I think so.

Q. Do I understand that you have made it the subject of study and comparison so that you are able to say that that is a well-considered opinion?—A. Yes, sir; I think that would be true on the average. Pig iron can be made as low as \$14 a ton in certain localities, showing that the labor there would only be about \$12, but those are exceptional cases.

Q. Where are those exceptional cases?—A. I know of some places in Alabama, but the amount of production in those sections, in comparison with the consumption, would be so small that it would hardly pay.

Q. What have been the average English prices for pig iron, say for two or three years, or for such time as you are able to make a comparison?—A. You can buy some there for \$16, and some for \$11. We get some cold-short iron here at \$18, and make about the same as by selling good iron at \$23 or \$24; but the question is, can you always sell

that iron? It is sometimes hard to get a customer for that quality of iron, because it is not a desirable article.

Q. And it is also an iron little likely to be imported largely?—A. Yes, sir.

Q. Simply because it is an unsalable article?—A. And it can be made so cheaply in England, too.

Q. Do I understand you, then, that English prices of pig range from \$11 to \$16?—A. You will have to take the different kinds of pig.

Q. But when you undertake to make a tariff that characterizes pig, I want your general idea as to prices.—A. I suppose \$13.

By the PRESIDENT:

Q. Do you include Scotch pig in that?—A. No; I do not think you could get good Scotch pig; but you can get the other pig cheaper.

By Commissioner AMBLER:

Q. What can you get good Scotch pig for?—A. I suppose it would be about \$14.

Q. What would be the ocean freight on it?—A. That depends so much upon circumstances. A year ago I knew pig iron to be brought here for one shilling a ton.

Q. That is to say, returning vessels brought it in ballast, when it only costs the handling?—A. Yes, sir.

Q. But the general range of prices would be what?—A. I suppose it would be 6s. or 7s.; that is, about \$1.50 or \$1.75.

Q. Counting \$20 as the average cost of pig here, what do you regard as a fair profit for making it?—A. With anthracite furnaces we can make it at \$2 a ton; not a big profit at all.

Q. What is your judgment as to whether the present rate of duty on steel rails (\$28 a ton) is a fair rate?—A. I think that is a high rate; and I think it was put there specially to encourage the building of our steel establishments. You can buy steel rails in England for about \$25 a ton, but I do not think that will continue long, for some of them are losing money at that. I am giving the very lowest prices. You might say \$28. The bringing of the rails over here would be \$3 or \$4, and you might count insurance, handling, and all that—very nearly \$5. Against that our steel works are in the interior, and a great many of those have to send to market at a cost almost half as great as this; so I do not think it is fair to add more than \$3 to the freight to equalize the difference between freight in this country and the ocean freight. Now, especially when rails go South, they can be shipped from England to Southern ports as cheap as they can from our own steel works, if not cheaper. What the South wants is such a tariff as will encourage them to put up steel works there and make their own rails, and not bring them from England, or from the North either.

Q. They must find the material to make the rails from.—A. They have got it down there. There is no reason, if they want a mixture of foreign ores, why they should not be able to get them on the sea-coast down there, as well as to take them from Pittsburgh.

Q. I believe it is pretty generally conceded that the rate on steel is more than it should be, is it not?—A. Oh, yes, sir; I do not think any sensible man would come before you and say the present rate is necessary at all.

Q. What, in your judgment, would be a fair and reasonable rate?—A. \$18 a ton.

Q. In your computation you have taken the very lowest price that you have known steel rails to be sold at in England, and I think you

said that that would not continue?—A. I think it would not; but I always want to calculate on the safe side for American manufacturers. I want just enough tariff to protect the labor of this country against the low-priced labor of Europe, but not enough to give the manufacturer power to impose upon the consumer. That always ought to be considered.

Q. We had a statement from Hon. Abram S. Hewitt, at Saint Paul, and his opinion was that from \$14 to \$16 would afford adequate protection. Would that meet your views?—A. I name \$18.

Q. You think the rates he has suggested are too low?—A. Rather low, I think. I believe our present steel works could live; but I do not believe there would be any building under a duty as low as \$14.

Q. What, in your judgment, is the cause of the reduction in prices of steel rails in the last ten years?—A. The American people have gone far ahead of the Europeans in cheapening the labor connected with manufactures.

Q. That is, reducing the quantity of labor.—A. Of course; not in the prices, but by reducing the quantity of labor in consequence of the introduction of machinery. Then another thing, it can be made so rapidly that these works throw so much into the market that the competition now brings down the prices. Of course, the price of labor will in the end govern the price of an article; but that is not always the case, because sometimes the supply is in excess of the demand.

Q. In that case the market would soon break and the supply decrease?—A. Yes, sir.

Q. We understood when we were at Chicago that they were selling steel rails there as low as \$45 a ton. Is it your idea that that would be less than the cost of production, or are you acquainted with the conditions at Chicago?—A. Yes, sir; I am pretty nearly as well acquainted with the business there as here. I suppose they can make them at that price without losing any money on them.

Q. But you do not think there would be any profit in it?—A. I do not think there would be any profit.

Q. I understand your idea is that there has been a real, substantial benefit to the people and to the railroads of this country by reason of even this excessive tariff on steel rails?—A. Yes, sir; I believe firmly if it had not been for that, that instead of steel rails selling at \$45 they would be \$90 to-day. The English manufacturer does not sell cheap always because he can make cheap. He never sells cheap when he can command the market and get high prices.

Q. How do you account for the reduction in the price of rails so much below the rate for which the foreign rails can be placed here?—A. It is on account of home competition.

Q. Entirely that?—A. Yes, sir.

Q. The present demand is good, I believe?—A. Yes, sir; but the works are a little slack of orders.

Q. That would seem to indicate that we had arrived at the point where there is an excessive production?—A. Yes, sir; we have got up to the point where our mills can produce a million and a half of tons of steel rails annually; and that will make a great many miles of railroad. What gave such a boom to the business is that all these great railroads had iron rails, but they found it necessary in their traffic to put down steel rails; and, as the iron rails would give out soon anyhow, a great many were taken up before they were worn out. They commenced doing that when steel was low. That created a very great demand for all these

main stems which I do not believe will ever occur again. I think now all the steel men are going to have a hard time and are going to work upon a low margin for years to come.

Q. Will it be profitable to make steel rails at \$45?—A. I think you will find the Pennsylvania steel works, at Johnstown, and the Edgar Thompson steel works quite up to the Chicago works, which have been more recently built. The old establishments have been throwing out their old apparatus and putting in new.

By Commissioner BOTELER:

Q. Do we make as good rails in this country as the English?—A. Just as good, if not better. The Pennsylvania Railroad Company has a chemical formula by which it has steel rails made, and those rails have all got to come up to that by analysis, or very near it, otherwise they are condemned. I think their preference is for American rails.

Q. From your knowledge of the mineral resources of the South, and other advantages there, how will it compare with other parts of our country?—A. I think the Southern country will eventually be the great iron producing region of this country. I think in Tennessee, Alabama, and Virginia, and perhaps in some parts of North Carolina and Georgia, they have large iron deposits. Their ores are very fine there, but, while I mention them, there are not a great many that are really Bessemer ores. A great many of them are low in phosphorus—so low that they are valuable for many other purposes; and if it was necessary for them to have Bessemer ores, they could take Spanish ores just as well as our sea-ports in the North take them. They have very fine coal, and very cheap labor in the South in juxtaposition to the ore.

By Commissioner AMBLER:

Q. The great cost of making the iron is getting the materials together?—A. Yes, sir; the freight is one very important item.

S. L. TAYLOR.

BALTIMORE, MD., *September 30, 1882.*

The following communication was read and ordered to be printed :

To the Tariff Commission :

Absence from the city when the Commission was here prevented my appearing before it to call attention to the duties exacted on wild animals. These duties do not protect any American industry, nor do they yield any considerable revenue, yet are very burdensome to the various zoological societies established throughout the country. These societies have gardens in which beasts, birds, and reptiles are kept in their natural condition as near as safety to visitors will permit. These gardens are permanent public educators, and have already done much in diffusing zoological knowledge. They have been established by zoological enthusiasts for the public benefit, and not with a view to profit. Some of them are prohibited from declaring dividends. None of them have ever earned dividends. They are not self-sustaining, and it is safe to say that if their incomes were doubled every cent of surplus over running expenses would be expended in the purchase of rare and interesting animals. The customs duties yearly paid by these zoological societies handicap them heavily, and prevent their extension. No American interest will be injured by the removal of the customs duties now levied on specimens of natural history. On the contrary the zoological knowledge of our people would be largely increased by the removal of the customs duties, as this cheapening of that which we do not and cannot produce would enable the zoological societies to keep their gardens filled with the finest and most interesting specimens of natural history.

Trusting that your Commission will recognize the propriety of admitting free of duty the beasts and reptiles of other lands, as birds are now admitted,

I remain, very respectfully,

S. LESTER TAYLOR,

President Zoological Society of Cincinnati.

CINCINNATI, OHIO, *September 21, 1882.*

CHAS. L. OUDESLUYS.

BALTIMORE, MD., *September 30, 1882.*

The following communication was read and ordered to be printed:

To the Tariff Commission:

GENTLEMEN: We notice a statement in the American of to-day regarding the use of "pyrites," in the manufacture of sulphuric acid. It is a well known fact that the largest part of this acid made in England is from pyrites, and that the mineral is considered far cheaper than sulphur—600,000 tons of Spanish and other pyrites having been imported into England in the last year. It averages 48 per cent. sulphur, and is quoted in the English market at 6*d.* per unit of sulphur, or about \$5.76 per ton of 2,240 pounds. If pyrites were wanted in this country there would be no need of sending abroad for them, as they could not be afforded at the prices at which they can be had at home, costing, say, \$8 per ton laid down without duty, while American pyrites in enormous quantities, giving nearly fifty per cent., can be supplied from Virginia alone for \$6 to \$7 per ton at tide-water. It is therefore a matter of no moment whether the duty on foreign pyrites is removed or not.

If the American fertilizer manufacturers want acid as cheaply as it is made in England, all they have to do is to erect furnaces for burning the sulphur after those long in use in England, which they will have to do sooner or later. Foreign sulphur costs \$30 to \$35 per ton, while 2 tons of iron pyrites costing, say, \$13 to \$14, will contain as much sulphur at less than half the cost of the Sicily article.

Yours, very respectfully,

CHAS. L. OUDESLUYS & SON,
No. 71 Exchange Place.

BALTIMORE, MD., *September 30, 1882.*

J. S. MOORE.

NEW YORK, *October 2, 1882.*

Mr. J. S. MOORE, of New York City, addressed the Commission as follows:

GENTLEMEN OF THE COMMISSION: The first tariff act on the statute books was approved July 4, 1789. The ostensible object of this measure was, of course, to raise revenue. Yet, at that early stage of tariff history, a lurking desire for protection is already noticeable. Pennsylvania, through her representative in the House, had the honor to sound the first key-note for protection. In the first debate on a custom tariff (in 1789) Mr. Hartley, of Pennsylvania, said:

I think it both politic and just that the fostering hand of the general government should extend to all those manufactures which will tend to national utility.

It must be confessed that this terse sentence was indeed the music of the future, and the subsequent arguments and the thousands of volumes that have been spoken and printed in defense of protection during nearly a hundred years are after all summed up in the above twenty-seven words. The tariff act of 1789, as may have been expected, was crude and unsystematic. But even thus early the bias to favoritism can be detected, for we find that, while iron in general only paid $7\frac{1}{2}$ per cent. ad valorem duty, yet iron chains and cables were subjected to a duty of 75 cents per hundred weight. The cable and chain makers evidently had a friend at court. A year later (August, 1790) Mr. Alexander Hamilton, as Secretary of the Treasury, advocated a higher rate of duties, chiefly on luxuries, such as wines, tea, jewelry, watches; also on sugar and cordage.

But the first unmistakable policy of a tariff for protection came from the Secretary of the Treasury, Mr. Hamilton, in his report of December 5, 1791. He frankly urged that home manufactures should be encouraged by protection. He felt sure that increased emigration would follow protection. In short, Mr. Hamilton is claimed as the first apostle of the protective system in America; yet I cannot, for the life of me, see why he is better entitled to that honor than the modest Mr. Hartley, of Pennsylvania, who, in 1789, had in reality in a few words condensed the whole protection policy.

Tariff changes were also made, both in 1793 and in 1794, but they were generally unimportant, and referred chiefly to articles of luxury. But there was always an increase, and the tariff system was progressing favorably toward that great triumph of protection which is chiefly found in complications.

Although measured by our present standard of tariff duties, the duties of 1789, 1790, 1791, 1792, 1793, 1794, were by no means excessive, yet the tendency to bewilder commerce is already shown in the continued multiplication of different rates. Thus, for instance, in the first three tariff acts we only find seven different rates of ad valorem duties besides, of course, the specific duties on numerous articles; yet in 1794 these ad valorem rates had already increased from seven to nineteen different rates, besides those of specific rates.

The subsequent tariff acts, up to July 1, 1812, were seven in number. But they seem all to have followed in the road of complication and higher rates. The duty on iron, for instance, had slowly but surely

crept up from 7½ per cent. in 1789, to 17½ per cent. in 1812, and other articles in proportion. But a time was now at hand when protection was really going to have a meaning.

War is the parent of bloodshed, oppression, and taxes. And the war of 1812 is the direct and great ancestor of our present tariff system. After all, prone as mankind in general is to gain advantages, it is above all necessary to have a plausible pretext for them. Now, what more plausible reason to tax a people can there be than an expensive and bloody war? Not many questions were asked on the passage of the very important bill of July 1, 1812, which doubled the then existing duties, when war with Great Britain had already been declared a month before. The duty on iron and cotton goods jumped up from 17½ per cent. to 35 per cent., yet the duty on perfumery, an article of luxury which had previously been 17½ per cent. rose in the same ratio only, and was also taxed 35 per cent. I simply point this out to show how unjust are the tariffs made during the confusion of war and strife. This tariff act, with a very few unimportant changes, was maintained up to 1816.

In the tariff act of April 27, 1816, a reduction was made in the duty on cotton goods from 35 per cent. to 25 and 20 per cent.; iron was also reduced from 35 per cent. to 30 per cent. But the general reduction was not very important. The worst feature, perhaps, was the changing of ad valorem rates in many cases to specific rates, which generally conceal a higher rate of duty under a convenient tariff trick. Altogether the war duties of 1812 were substantially sustained.

The next very important change in the tariff was made May 22, 1824. This change was still more in the interest of protection. Mr. Tod, from the Ways and Means Committee, proposed a change of the tariff, pure and simple, in the interest of protection. It was this tariff act that aroused the ire of Mr. Webster, and he spoke against the proposed increase of duties as follows:

Look to the history of our laws. Look to the present state of our laws. Consider that our whole revenue, with a trifling exception, is collected at the custom-house and always has been; and then say what propriety there is in calling on the government for protection, as if no protection had heretofore been afforded. The real question before us, in regard to all important clauses of the bill, is not whether we will lay duties, but whether we will augment duties. The demand is for something more than exists, and yet it is pressed as if nothing existed. It is wholly forgotten that iron and hemp, for example, already pay a heavy and burdensome duty; and in fact one would infer that hitherto we had rather taxed our own manufactures than fostered them by taxes on those of other countries. We hear of the fatal policy of the tariff of 1816; and yet the law of 1816 was passed avowedly for the benefit of manufactures, and with very few exceptions imposed on imported articles a very great addition of tax; in some important instances, indeed, amounting to a prohibition.

On the general question, sir, allow me to ask if the doctrine of prohibition, as a general doctrine, be not preposterous? Suppose all nations to act on it; they would be prosperous then, according to the argument, precisely in the proportion in which they abolished intercourse with one another. Protection and encouragement may be and are, doubtless, sometimes wise and beneficial if kept within proper limits; but when carried to an extravagant height or to the point of prohibition, the absurd character of the system manifests itself.

To read these few extracts from Mr. Webster's speech one could hardly believe they were spoken sixty years ago, so pertinent do they seem at the present juncture. Nevertheless the tariff revision passed, and protection further gained important results.

Then came the tariff of 1828, which still further increased duties over that of 1824, and was altogether the highest tariff that the United States had yet adopted. It will thus be seen, that step by step from 1789 to 1828, the tariff history of the country was in the direction of higher duties and home protection. The consumers, however, began at last to

feel the burden, and there was great discontent after the tariff act of 1828 had passed. It was in November, 1832, that South Carolina passed the famous nullification act, which modestly annulled all Federal tariff laws, and even prohibited the payment of duties in the State of South Carolina, so far did excitement and anger outrun sound reason. But there was a man at the helm of the government at the time to whom the word nullification was as strange as it was obnoxious, and he gave such strong indications of punishing nullifiers as rebels, that the discontented, who instinctively felt that General Jackson was a man to keep his word, prudently withdrew their nullification ordinance, although it is generally agreed that the Clay compromise bill was the chief peacemaker. And here it may be remarked, that the tariff system being pure and simple an economic question, needs no violence for adjustment. Reason and facts alone are the all-powerful weapons with which to fight tariff wrongs and tariff usurpations.

The act of 1832-'33 is known as the Clay compromise tariff act, which enacted :

That in all cases where duties are imposed on foreign goods exceeding 20 per cent. one-tenth part of such excess shall be deducted from and after the 31st day of December, 1835, 1837, and 1839, respectively. On the 31st December, 1841, one-half of the remainder of such excess shall be made, and on the 31st of December, 1842, the residue of such excess shall be deducted.

The Clay compromise bill is further celebrated for the additional number of articles that were put on the free list. This tariff compromise seems to have put the tariff question to rest for nearly ten years ; and the next general tariff change was made in 1842.

During the ten years that intervened between Mr. Clay's compromise bill and the act of 1842, the violent panic of 1837 raged all over the land, and no doubt in the bitterness of their distress the people laid the fault rather to the homeopathic reduction of duties, and the abrogation of the bank charter than their own insane speculative mania. History relates that the Presidential campaign of 1840 was fought on two distinct issues, namely, on the restoration of a United States bank and on the policy of protection. These two issues were extremely successful and Harrison and Tyler were triumphantly elected. Mr. Harrison died four weeks after his inauguration, and Mr. Tyler, now President, vetoed the fiscal agent bank bill, and approved the so-called Whig tariff of 1842. This tariff restored substantially the rates of 1824, and in some instances even those of 1828. In other words it reversed the Clay compromise act. The bill was approved August 30, 1842. Of course, the old complications, the usual inequalities, the blind specific duties that had characterized all former tariffs were upheld. The Whig tariff lasted four years. In 1844, Mr. Polk was elected President, and we now approach a remarkable period in the history of tariff reform in this country.

The administration of Mr. Polk is celebrated: First, for carrying on a three years' foreign war upon the Democratic principle, which did not enrich anybody in particular, and only increased the debt of the country forty-eight million dollars, out of which sum California was paid for. Second, the fairest portion of the continent on the Pacific coast was acquired ; and third, it gave the country a fair and equitable tariff.

In the unpretending Cabinet of Mr. Polk was a great man, and like all great men he did not trade on the fact that he was a genius, for such he undoubtedly was. It has been the rule to accept Mr. Alexander Hamilton as the greatest financial genius this country ever had. But when the future historian, unbiased by the influence of parties now still in

existence (which sooner or later must die), writes the history of the United States during the first century of her national life, he will, no doubt, do justice to the financial, and above all economical, genius of Mr. Robert J. Walker, Secretary of the Treasury under President Polk. To this great man the honor is chiefly due of only leaving an increase of a paltry forty-eight million dollars national debt after a three years' foreign war, and paying for California besides. Of course such an achievement finds little applause now. The country has outgrown these extreme Democratic economics; but neither this country, nor the civilized world can or will outgrow economic truths, and for this Mr. Walker's fame will surely rise again with renewed splendor, to be appreciated by his countrymen. Mr. Walker conceived the idea of reforming the tariff and tariff laws of his country upon an equitable, honest system. Like all great achievements, the Walker tariff system is simple in its grandeur and grand in its simplicity. Nowhere in the tariff histories of the world (and I have made them nearly all my study) can a tariff system be found that rests or has rested upon rules so simple, just, and equitable as the tariff act of 1846. In his first report, dated December 3, 1845, Mr. Walker laid down six distinct principles upon which his great economical act (that is, the tariff) was to rest. And these I will explain as I give them :

1st. That no more money should be collected than is necessary for the wants of the government, economically administered.

This economic principle is the greatest safeguard against excessive taxation, and is the very essence of the much-abused sentence "a tariff for revenue only." Mr. Walker disdained to insult the intelligence of his countrymen by pointing out that to whatever extent a foreign article is taxed a similar product made at home is incidentally protected. Such a fact is perfectly self-evident, and when modern tariff trimmers pretend to have found in this very fact a contradiction to the principle of a tariff for revenue only, they only ventilate their own tricks by insulting the intelligence of the people.

2d. That no duty be imposed on any article above the lowest rate which will yield the largest amount of revenue.

This second principle again points to the economic policy of getting revenue. When for instance more revenue can be got out of iron, sugar, or woollens at 30 per cent. duty than at 50 per cent. duty (which is very often the case), the lower duty should then be imposed.

3d. That below such a rate discrimination may be made, descending in the scale of duties, or for imperative reasons the article may be placed on the list of those free from all duties.

In other words, you can reduce duties, or make articles entirely free, when they no longer yield adequate revenue. Or for such imperative reasons as benefiting manufacturing industries, or consumers, articles should be made free, if you can spare the revenue.

4th. That the maximum revenue duty should be imposed on luxuries.

This principle needs no explanation.

5th. That all minimum and all specific duties should be abolished, and ad valorem duties substituted in their place, care being taken to guard against fraudulent invoices and undervaluation, and to assess the duty upon the actual market value.

It is an economic truth, admitted alike by protectionists and tariff reformers, that the ad valorem system is the only equitable rule for assessing duties on foreign articles. Being satisfied that such a system is the very keystone of fair taxation, Mr. Walker was entirely confident of

being able to collect the revenue and guard against fraud. With the whole power of a great government to back him, he saw no reason why the laws of the country could not be enforced. The outcry of undervaluation is simply a trick to blind the people, as it would be literally impossible to enact a law which would dare to ask for such enormous duties as 80, 90, 100, and even 200 per cent. in its plain, unvarnished form of ad valorem duties. These enormities, of which the present tariff is full, exist simply because they are hidden under the convenient deception of specific duties, and in many instances of compound duties.

6th. That the duty should be so imposed as to operate as equally as possible throughout the Union, discriminating neither for nor against any class or section.

To explain this last principle by the light of modern tariff history it simply means: That Mr. Walker did not recognize plate glass in Indiana, pottery-ware in New Jersey, spool-thread in Pawtucket, sugar in Louisiana, or steel rails in Pennsylvania.

Being an old-fashioned democrat, his aim was equal justice and equal rights to the whole people; he knew neither class nor section.

Mr. Walker divided his tariff classification into nine schedules. These schedules differed, however, from all former classifications, inasmuch as the different rates became the schedules, whereas at present, for instance, a single schedule in our tariff system contains many different rates.

The tariff classifications of the 1846 tariff were briefly as follows: 100 per cent., 40 per cent., 30 per cent., 25 per cent., 20 per cent., 15 per cent., 10 per cent., 5 per cent., and a free list.

Under a 100 per cent. duty, distilled spirits and brandy were classed.

The 40 per cent. duty was charged on spices, preserved fruits, cigars, snuff, manufactured tobacco, and wines.

The 30 per cent. duty was laid on a variety of manufactured articles, chiefly woolens, iron, china, and stone ware, manufactures of copper and brass jewelry, manufactures of glass, leather, marble, and wood, wool, raw wool, sugar, and sirup, leaf tobacco, and a few other articles.

Under the 25 per cent. rate came manufactured cotton goods, manufactures of goat hair, silk, and worsted.

The 20 per cent. duty was charged on all drugs and chemicals, copper bolts, nails, and spikes, copper bottoms, and copper in sheets or plates, fish, fruit, tanned leather, lead in pigs, bars, sheets, leaden pipe, and shot, linens of all kinds, tanned leather, window glass, and some other articles.

Under the 15 per cent. duty came articles like Peruvian bark, tow of hemp or flax, raw silk, steel in bars, cast-steel, and German steel, tin plates, zinc and spelter, &c.

The 10 per cent. rate comprised books, periodicals, building and burr stones, diamonds and other precious stones, India-rubber unmanufactured, watches and watch materials.

The 5 per cent. rate had reference to all classes of articles in the first stages of manufacture which are so much needed to this day, which enter into manufactured articles, and become therefore a great boon to our varied industries.

The free list was very meager, and the chief articles were tea and coffee.

Such is the outline of this celebrated tariff. The object seems to have been to charge a lesser duty on partially manufactured goods in their various stages, and a higher rate of duty as they ascended to a state of perfection.

I shall only read a few extracts from Mr. Walker's report, in which he finds a justification for ignoring protection :

The constitutional power of Congress "to lay and collect taxes, duties, imports, and excises" does not authorize the laying of a prohibitory duty, or a duty in which revenue is sacrificed to the object of protecting the manufacture of the commodity taxed.

Taxation, whether direct or indirect, should be as nearly as practicable in proportion to property. If the whole revenue were raised by a tax upon property the poor would pay a very small portion of such tax, whereas, by the consumption of imports or of domestic commodities, enhanced in price under the tariff, the poor are made to pay a much larger share of the taxes than if they were collected by an assessment in proportion to property. To counteract, as far as possible, this effect of the tariff, and make it approximate to a system of taxes in proportion to property, the duties upon luxuries should be fixed at the highest revenue standard. This would not be discriminating in favor of the poor, but would mitigate that discrimination. * * * A protective tariff is a question regarding the enhancement of the profits of capital and not the augmentation of the wages of labor. It is a question of percentage, and is to decide whether money vested in our manufactures shall, by special legislation, yield a profit of 10, 20, or 30 per cent., or whether it shall remain satisfied with a dividend equal to that accruing from the same capital invested in agriculture, commerce, or navigation. * * * It seems strange that while the profit of agriculture varies from 1 to 8 per cent., that of manufactures is more than double. The reason is that while the high duties secure nearly a monopoly of the home market to the manufacturer, farmer and planter are deprived, to a great extent, of the foreign market by these duties. The farmer and planter are, to a great extent, forbidden to buy in the foreign market, and confined to the domestic articles, enhanced in price by the duties. The tariff is thus a double benefit to the manufacturer, and a double loss to the farmer and planter. * * * The true question is, whether the farmer and planter shall, to a great extent, supply our people with cheap manufactures purchased abroad with their agricultural products, or whether this exchange shall be forbidden by high duties on such manufactures, and their supply thrown as a monopoly, at large prices by high tariffs, into the hands of our own manufacturers.

If our so-called free traders, or tariff reformers, would circulate Mr. Walker's report on the tariff *in extenso*, there would be no need for free-trade writers. An immortal truth, although written thirty-six years ago, comes home quite as strong now as in the days when it was written or spoken.

The Walker tariff passed the House by a large majority, but came very near being lost in the Senate. In that august body it was passed by the casting vote of the Vice-President of the United States—the President of the Senate—who singularly enough was the gifted son of the great and powerful State of Pennsylvania, that State to whom a protective tariff seems to be equal to a first cause. Mr. Dallas, in giving his casting vote in the Senate in favor of the great tariff measure, made use of the following remarkable language. He said :

The struggle to exert without abatement the constitutional power of taxation in such a manner as to protect, by high duties on imports, many of the productions of our own soil and labor from the competition of other countries, has endured for more than thirty years. During that period a system of high taxation has prevailed, with fluctuations of success and failure. It ought to be remembered that this exercise of the taxing power was originally intended to be temporary. The design was to foster feeble "*infant*" manufactures, especially such as were essential to the defense of the country in time of war. In this design the people have persevered until these saplings have taken root; have become vigorous, expanded, and powerful, and are prepared to enter with confidence the field of fair, free, and universal competition. The arrival of this period of time has been anxiously looked for by a large portion of our fellow citizens, who deemed themselves peculiar and almost exclusive sufferers by the policy of protection. They have sometimes, perhaps imprudently, endeavored to anticipate it. Their numbers, at first entitled in influence only from their patriotism and intelligence, have gone on gradually increasing as the system ripened to its fruit, and they now constitute a decided majority of the people of the Union.

The Walker tariff system lasted fourteen years, although a reduction of 20 per cent. in rates was made in 1857, and articles that paid 30 per cent. were reduced to 24 per cent. ad valorem, and so on throughout

the list, except spirits, that previously paid 100 per cent., were reduced to 40 per cent. ad valorem. But the real system of the tariff was in no ways changed. During these fourteen years of the Walker tariff the country prospered. The foundation for manufacturing on the largest scale was laid on a solid basis. And when the panic of 1857 came its duration was the shortest on record. This economic system would certainly not have been overthrown had there not been by far a greater issue at stake. The time was now fast approaching when the curse of slavery was to be abolished forever from this free land by a fearful civil war, and the opportunity was too tempting for sectional interests not to profit by it.

It was Mr. Walker's melancholy lot to see his great system ruthlessly torn down. His feelings could, perhaps, be expressed by the famous speech of "Bailey," who, when sentenced to be guillotined, said to his judges, "I lose my head because the people have lost theirs. You will lose yours when the people find theirs again."

Yes, the time is approaching, and very fast, too, when the principal political issue will be protection, pure and simple, not against free trade, but against the Walker tariff system of 1846. And if it has no other results, it will at least prevent tariff tricksters playing fast and loose with the greatest economic question of the age.

The first tariff shriek, like an ill omen of the bloody strife that was hovering over this devoted land, was made as early as March, 1860, preceding the eventful election of Mr. Lincoln. This was the famous tariff bill of Mr. Morrill. But the measure held over to the second session of Congress of 1860 and 1861. It is a historical fact that the Morrill tariff bill was discussed and passed during the short session of 1860 and 1861, while the eleven States were passing the ordinances of secession. Thus, it will be seen that, as the high tariff of 1812 was the offspring of war, so again the still higher protective system had its very inception while a fearful civil war was preparing. The bill was approved March 2, 1861. There is little left of this so-called Morrill tariff at present. And it must not be supposed that it raised duties very materially. The great object seems to have been to restore as near as possible not only the rates of 1842 (the so-called Whig tariff), but also, above all, to break down the equitable ad valorem system.

Specific duties were once more resorted to. And for the first time compound duties were introduced, and there was no disguise in asking for these changes in the interest of home protection.

In the mean time the war began, and the Morrill tariff act was speedily augmented by a rise in rates in August of the same year, as well as in December, 1861. It were useless to go into the several tariff acts during the war separately. Tariff acts followed tariff acts, and all had the same tenor—higher rates, specific rates, and compound rates. A perfect tariff saturnalia was the order of the day. But in justice to many men then in Congress, who were adverse to these tariff exactions, it must be said that they acquiesced in them simply because there was the one great object to gain, namely, peace and unity.

Still, tariff exactions became so deeply rooted during the war that as soon as the war was over the first thing that was asked was a little more protection, and a good deal more tariff complication. No less than twelve tariff acts passed between 1866 and 1870. They were nearly all in the interest of protection and complication. The most important of these changes was the tariff on raw wool, and woolen fabrics, passed March 2, 1867.

It is useless, and by no means edifying, to relate how the copper bill

was passed over the President's veto in March, 1868, or how hair-pins were raised from 35 per cent. to 50 per cent.; or how emery ore was taken out of the free list and taxed \$6 a ton, because an emery ore mine was discovered in Massachusetts. The present tariff law is before the commission, and that it has become oppressive and a scandal, the very fact of the appointment of this commission to revise it is the best proof.

TARIFF REVISION.

In revising and simplifying the present tariff, the great question is, should it be done in the interest of protection? The protective system claims a high tariff, and in many instances prohibition disguised under specific or compound rates, for three reasons:

1st. The industries of this country are still in their infancy.

2d. The home industries cannot compete with the pauper labor of Europe.

3d. Home protection gives employment to labor and prosperity to the country.

Let me briefly examine these three assertions.

First, "infant industries." There seems to be something so ridiculous, so very shamefully ridiculous, in this claim of infancy, for a home industry that produces between five and six thousand million dollars of manufactured products annually, that it makes one feel astonished at the daring of the assertion. Is the woolen industry an infant, when it produced in 1880 \$265,684,796 worth of manufactured products?

Is the iron and steel industry an infant, when its manufactured product amounted to \$296,557,685 in 1880? Is the cotton industry an infant, that in 1880 used 1,586,000 bales of raw cotton, and now uses nearly 2,000,000 bales? Is the chemical industry an infant, that vaunts a production of some hundred million annually?

I hope I shall be pardoned a passing levity, but I submit respectfully that Tug Wilson would by far have more reason to call himself an infant than the giant industries of the United States. With the single exception of England there is no country in the world that produces manufactured goods so largely as the United States. Besides, how can this country, with its 52,000,000 of souls, unquestionably the most enlightened people in the world, with a mechanical genius superior to any nation on earth, with machinery surpassing any used in Europe, how can such a people make a plea of infancy for its industry without a blush? Whatever other reason there may be for upholding protection, it surely cannot be made on account of infancy. Remember the words of Mr. Dallas thirty-six years ago. He even then assured his countrymen that the time of infancy had passed; that the industries had become strong and able to stand up against foreign competition. Yet thirty-six years later, with a production that the past generation could hardly have dreamt of, we are called upon to believe that we have passed into a second state of infancy. The claim of infancy for our industries is as ridiculous as indeed it is preposterous.

Far different, however, is the second plea for protection, which pretends to be unable to compete with the pauper wages of Europe. This requires a more serious consideration.

Now, as a rule, I admit of course that our wages are higher than in Europe, and were the competition between the United States industries and those of Europe purely and simply a question of hand labor only this country would indeed find it hard to compete. But, what are the real facts? Modern inventions of labor-saving machinery have neutral-

ized this great bugbear of pauper labor; intelligence, means, and the best machinery may well laugh at the pauper wages abroad. And now let me show you how the most aristocratic labor of the United States competes with the most abject pauper wages of the world three thousand—nay, I may say, five thousand—miles from home.

During the fiscal year just ended June 30, 1882, we exported \$182,015,000 of breadstuffs, and nearly \$200,000,000 of raw cotton. These products met as competitors in England, France, and Germany the pauper labor of India, of Russia, of Egypt, and the slave labor of the Brazils, and yet American high-priced labor triumphed over this pauper competition. The Illinois, Minnesota, and Iowa wheat met the wheat of Southern Russia on the neutral field of Mark lane. What are the conditions of those two localities?

In South Russia the soil is unsurpassed in productiveness by any in the world. This land is far cheaper in South Russia than in Illinois or Iowa. The cost of labor is, perhaps, 25 cents or less per day. Inland transportation to the Black Sea is chiefly done by water, on the great rivers and their tributaries, and freight from Odessa to London is not more, if as much, as from New York to London. This is the condition of grain production in South Russia.

Now, let us turn our eyes to the great States of Illinois, Minnesota, and Iowa. These States have a good soil, but by no means better than that of South Russia. Land has attained a fair price, and is, indeed, higher than in Russia. Labor costs, say, on an average, only \$1 a day (during the harvest time \$2 is paid). The cost of inland transportation to the sea-coast is undoubtedly three times as much as in South Russia, and the freight from the sea-coast to London is quite as much as from Odessa to London. With all these disadvantages our farmers, paying the aristocratic wages of America, compete, and compete advantageously, too, with this miserable pauper labor of Russia. But the solution is easy enough. It is not a competition between the highest price of labor against pauper wages. The competition is between a state of intelligence and abject ignorance; between the employment of skill and science against a semi-state of barbarism; between a class whom labor elevates and makes the peer of the proudest of the land, against a class whom labor degrades. By the aid of science the land in our Western States is made to yield its fullness. By the aid of skill and employment of labor-saving machinery, an outlay of money on a threshing machine, two men in Illinois will do the work of perhaps one hundred men during twenty-four hours, who still employ the traditional flail of four thousand years ago. Is it, therefore, a wonder that our farmers can compete in grain in London with South Russia? The eventful and doubtful competition that our farmers may dread is not that of the pauper wages of Russia, Turkey, and Egypt, but of the still higher wages paid in Australia than in America. From that portion of the world, whose inhabitants are of the same race as our own, who have the means of employing science and skill, a more dreaded competition will spring up, and the only advantage we have is a nearer market.

Another example of the fallacy that pauper wages can beat or even compete with aristocratic wages can be found in the industry of England. The price of wages paid in England is nearly, if not wholly, double that paid on the Continent. England has free trade, except in such articles as she does not produce; and England does not only exist, but, compared with the Continent, she flourishes. Her people are socially better off, they are better fed and better housed than those on the Continent.

Her industries increase, and her commerce is spread over the entire world.

Perhaps a still greater demonstration that the plea of foreign pauper labor is sham was made before this honorable commission. A manufacturer of watches in Boston, who asked for free watch jewels and a little increase of duty on the pauper-made watches of Switzerland, substantially admitted that his establishment alone sold \$50,000 worth of American watches in London, where they had to compete with the Swiss pauper-labor watches. But, said this ingenious supplicant for a little more protection, it is our machine-made watches that can compete with the pauper Swiss hand-made watches in London. The astute watch manufacturer, in a moment of enthusiasm, seems to have been oblivious how impertinent his supplication for a higher duty on Swiss watches was, on the plea of aristocratic wages in the United States against pauper wages in Switzerland, when he admitted it was the American machine, and not the wages, that beat the Swiss pauper. Nor is this an isolated case. If the American manufacturer had free raw material, free dye-stuffs, free machinery; in other words, if put upon an equal footing with English manufacturers, the higher wages of the United States would not be a formidable drawback.

Look at the census of 1880. We find that the total value of finished woolen fabrics was in round numbers \$265,684,000. The total wages paid to produce this vast amount of goods in round numbers was \$47,725,000, which means that every \$100 worth of finished product represented \$22 of cost of labor. Now, the pauper labor of Europe must cost something; say that ours is double, and it would follow that in order to be perfectly equal in the cost of production our labor should be protected about 11 per cent. in the manufacturing of woolen goods. Of course the price for labor in woolen goods is not anything like double in this country as compared with the wages paid in England, but as an argument it shows how insignificant the protection needed purely and simply for higher wages here really would be if based upon the actual facts of the case. Unfortunately, like sin that begets sin, so does protection beget protection; the cloth is protected because the wool is protected; again it is protected because dye-stuffs are protected; once more it is protected because oil and chemicals are protected; then there is a cry that machinery is protected; in short, all and everything used to manufacture woolen goods is protected. The cry of high labor is the convenient pretext, but it is not the real reason why American manufacturers cannot compete with foreign products.

It is astonishing with what impunity a fallacy can be persisted in which the commercial history of the country during the last decade so decidedly contradicts. In September, 1873, a panic burst suddenly upon the country. It was at first supposed that it would merely affect the stock speculations in Wall street. Unfortunately its ramifications were of a nature that plunged the whole country into industrial and commercial distress, which lasted nearly six years. It is not my purpose here to go into a lengthy demonstration to show that by dint of extreme protection values became inflated, and that this very inflation was the chief fuel that caused industrial distress during several years. What I will point out is the fact that high protection, which had in September, 1873, reached its thirteenth year and was kept up during the panic, was unable to arrest the continuous distress of the country. How was it, I solemnly asked the upholders of high protection, that protection lost its potency from September, 1873, to the summer of 1879? In 1876, when the Morrison tariff bill proposed a very mild re-

duction of duties, Mr. Kelley, of Pennsylvania, received the following telegram from the Iron and Steel Association, which was read in the Committee of Ways and Means :

With failure upon failure of our most experienced and respected iron masters announced in public print from day to day ; with wages of iron workers necessarily reduced so low that they and their families can scarcely escape destitution and starvation, the American Iron and Steel Association is astounded to learn that a reduction of duties on foreign iron is seriously contemplated by the Ways and Means Committee, and it respectfully, through you, protests against such action.

I will not insult the integrity of a great association to even doubt that what they stated was perfectly true. But where was the Baal of protection all this time ? Why did he not come to the relief of this distress, which then had already lasted some three years ? Alas ! he was as lame, as impotent, and as false as the Baal in the Bible. The one was unable to strike a lucifer match on the plains of Judea three thousand years ago, and the other could not light a blast furnace in Pennsylvania. Yet iron and steel were protected then still more than they are even now, owing to the specific duty charged on cheaper goods. Is it not a patent fact within our personal knowledge that the country was overrun with tramps ; that sturdy working men went begging from door to door ? Is it not further an historical fact that several vessels cleared our ports for Australia with emigrants, not, as formerly, to seek gold, but to work for a living ?

Is it true or false that American workmen went to Scotland, glad to be employed on the Clyde and receive the much-desired pauper wages ? It would take volumes to relate the dire distress of these unfortunate times, and all in the face of the highest home protection the world has ever known. With what grace, with what truth, can protection be cited as giving steady employment to labor, when these facts of only yesterday are still in our minds ?

I have stated that during the fourteen years of the Walker tariff we had a panic in 1857, but its duration was only a question of months and not years. I do not here positively claim that comparative free trade prevented the panic of 1857 from lasting several years, but what I do claim is that high protection was unable to stem industrial distress during six years, and claiming this, I am justified in pronouncing the assertion that protection is a preventive of industrial distress a fallacy and a sham.

I intend for several prudent reasons to touch only lightly on the strikes that during the present year, in the face of prosperity and high tariff, disturbed and still disturb the great industries of the country. I shall only quote one more extract from Mr. R. J. Walker's report, written thirty-six years ago on this subject, and leave its importance to the wisdom of this honorable commission to heed or reject it. Mr. Walker said :

When the number of manufactories is not great, the power of the system to regulate the wages of labor is inconsiderable ; but as the profit of capital invested in manufactures is augmented by the protective tariff, there is a corresponding increase of power, until the control of such capital over the wages of labor becomes irresistible. As this power is exercised from time to time, we find it resisted by combinations among the working classes ; by turning out for higher wages or for shorter time ; by trades-unions, and, in some countries, unfortunately, by violence and bloodshed. But the government, by protective duties, arrays itself on the side of the manufacturing system, and, by thus augmenting its wealth and power, soon terminates in its favor the struggle between man and money.

And now I shall comment on the boasting fallacy that our present prosperity is the result of the protective system. I might perhaps con-

tent myself, in refuting this monstrous assertion, with pointing out that if the Baal of protection was unable to light a blast furnace during six years of distress he surely could not be the cause of our present prosperity; but I will in the shortest possible manner give the cause of the revival of trade.

The panic of 1873 was the natural cause of inflation, overtrading, and overbuilding of railroads that were not warranted by the demands of the country. During the continuance of this fearful panic a general and gradual liquidation took place. The thousands of factories, corporations, and general securities, passed from the hands of the mushroom owners at prices that would not amount to 30 cents on the dollar in average. The failures during five years were on an average about \$200,000,000 per annum. In short, a new set of men sprung up who overtook the salvage of the great national industrial wreck, figuratively speaking, for a mere song. The shrinkage of values had in 1878-'79 reached the very bottom prices. During the five or six years of this panic the whole country very naturally economized its expenditures. Now, while the liquidation of former inflation was going on and the economy of the people was the most marked in the history of the country, a still greater factor appeared to lay a solid foundation for a return of great prosperity, namely, Europe, but especially Great Britain, was visited ever since 1873 with bad harvests; year after year this dire calamity reappeared, while this country was on the other hand blessed with the most bountiful yield of breadstuffs and cotton ever known. Thus, not only a ready market but a high priced market was open to our surplus of cereals and other food, and the balance of trade during the six years of 1876-'81 inclusive amounted to no less than \$1,180,000,000 in our favor. This was brought about by the farmer, and not by the manufacturing industries. Well, then, how could prosperity fail to set in under such a state of things—a five years' liquidation, followed by the greatest national economy, and supplemented by the immense balance of trade in our favor? Yet protection does not blush to arrogate to its policy the credit for the prosperity of the country.

To sum up this question, I am firmly of the opinion that protection had no more to do with bringing back prosperity than has the tide waiter with the rise of the tide, and the notion that we ought to uphold the present fearful high taxation, or to augment it, because our home industry is still in a state of infancy, and cannot compete with foreign pauper labor, and that protection is a sure means of giving employment and assuring prosperity, is a perfect delusion and not borne out by historical and contemporaneous facts.

The practical question now arises, what do tariff reformers really want to see accomplished? I may safely answer for that vast number of sincere tariff reformers whose voices and intelligence cannot very well be ignored, that two things are indispensable to tariff reform: first, a reduction of tariff taxes, and second, tariff simplification.

I suppose no one will deny that we paid over \$200,000,000 of tariff taxes into the treasury during the last year. Nor can honest intelligence deny that this tariff tax enhanced the price of the thousands of million dollars of home product that the people consumed during the year. Now, either a tariff tax enhances the price of home manufactures, or it does not; if it does, we demand a reduction of some of these monstrous duties that disgrace our economic system. If the tariff, on the other hand, does not enhance the price of home-made goods, then I can see no reason for retaining these excesses on the statute-book.

But it would be perfect folly to deny that the consumer is heavily

taxed on the articles made at home through the means of our tariff system. The really great excuse for the present high tariff was, that the monstrous expenses of a great war made it imperative for a patriotic people to bear what was justly termed "war taxes." But is it not an undue assumption of arbitrary power to continue these war taxes after a lapse of seventeen years of peace and tranquillity? Nay, is it not an oppression when we find two of the most important necessities of life, sugar and woolen clothing, paying a still higher tax than they paid during the war? What possible justification can there be for paying 25 per cent. more than a war tax on sugar? It has been argued often enough that after all these taxes are paid by the American people to the American people, and the country has grown rich by it. But who in this case is the country?

Frederick the Great taxed his people very heavily, and took good care that nothing, if possible, should leave his treasury if he could help it. Now the king's treasury was rich, but the people were poor and oppressed. Is it the less a tax to the Iowa or Minnesota farmer if he uses woolen goods, cotton goods, iron, or medicines to know that the tax he pays goes to enrich the eastern or northern localities of his own country? Pray, look upon it in a true economic light. If the multitude of the western consumers were less taxed, directly and indirectly, by this tariff system, they would most assuredly have a larger surplus of money in the aggregate in their own communities than they now have. In the diverting of this surplus from these young States, where capital is the very life of their hard-struggling prosperity, they suffer a grievous wrong. The riches of the great millionaires a thousand miles away are to them what Frederick's barrels of money were to his people. It is the multitude of the small sums saved by less taxes that aggregates so immensely in a community.

An indirect tax is a wrong endured, because it is a cunning device of oppression in an ingenious way. Still, it is said in answer, were it not for the grain consumers of the manufacturing States, the western farmer would have a much less market for his products. But what are the real facts? In 1880, Pennsylvania, with a population of 4,282,786, actually raised 19,462,000 bushels of wheat, which was ample for her needs. Ohio, which is so anxious for protection, had a surplus of some 30,000,000 bushels of wheat in 1880. In short, with the exception of the New England States, the western farmer has only one market for his surplus products, and that is a foreign country.

Oppressive taxes are upheld by either bayonets or ignorance, or both. Now, happily, there is no bayonet element in our tariff oppression, but it is upheld by the ignorance of the taxpayer. Let me show you an example in the present controversy of the duty on cotton-ties. Of course I will not here enter into the merits of the case, to show why cotton-ties, made of hoop iron, should only pay 35 per cent. duty, and the material they are made of 70 or 80 per cent. But what are cotton-ties, and who pays for them? It has been stated before this commission that the planter who pays, say, for argument's sake, five cents a pound for cotton-ties, gets 10 or 11 cents for the weight in return when he sells a bale of cotton, and, therefore, he ought not to grumble when he is called upon to pay 70 or 80 per cent. tax to uphold the industries of his country. The facts are simply these: First, the price of cotton is made in the Liverpool market. Second, every bale of cotton sold in Liverpool is subject to six per cent. tare. In other words, if a bale of cotton weighs 450 pounds in New York, when sent to Liverpool and sold there, the owner is paid for 423 pounds only. Thus it is as clear

as the sun at noonday that the planter *pays for and loses* the covering of the cotton. Does anybody in his senses suppose that the New York shipper will pay for 450 pounds of cotton and lose 27 pounds of it when he sells it in Liverpool? If the multitude of the planters would fully understand this fact, they would see that the covering of cotton is just as much an expense to them as is the payment of picking or ginning cottons. Now, the loss of six per cent. on the total production of cotton in tere is unavoidable, and it amounts on a 6,000,000 bale crop to no less than the value of 360,000 bales of cotton. Yet is it possible that the cotton producers, whose sole means of prosperity is the production of cotton, should be taxed first, 40 per cent. on the cotton bagging, and second, 35 per cent. at present (or 70 per cent. in prospect) on the cotton-ties, which to them is a total loss? In short, the cotton planter is taxed not on his profits, but on his losses. Such is the working of a tariff tax upheld not by bayonets, but by ignorance.

But while demanding a reduction of duties, the practical mind must admit that it were unwise to step from one extreme to the other.

The tariff revision I have the honor to lay before you simply proves that tariff reform should be moderate. It may, perhaps, be pointed out as inconsistent with this that I have recommended raw wool, now paying some 50 per cent. duty, to be put on the free list, which, seemingly, is going from one extreme to the other. But I have been assured, on very good authority, of which such a practical man as the late Elisha Harris was the most eminent, that free raw wool would not depreciate the price of home-grown wool, but on the contrary would be apt to increase the demand. Besides, I know too well that such a step, namely free wool, is the very keystone to the modification of the present monstrous duty on manufactured woolen goods.

I leave to the wisdom of your honorable commission to decide whether the time has not arrived when the reductions herein recommended can with perfect safety be adopted.

But what is by far more important than large or small reductions of the present duties is simplification. A deception cannot be just, and what rests on justice has no deception in it. Now, is it, or is it not, a deception when a duty of a hundred per cent. is hid either in a specific form or by a compound duty?

It has been suggested that specific duties should be based upon the average value of goods abroad for the past three years. I admit that in many instances such a duty could be satisfactorily (although by no means perfectly justly) based. In fact, if such a plan is adopted it will be the best exposé of the enormous duties hidden under the blind specific and compound duty forms. But in Schedule L, wool and woolens, there is only one exception, and that on shoddy, where a single specific rate is charged. Hence I cannot see why the whole schedule could not be made pure and simple *ad valorem*. And this may also be said of Schedule A, cotton goods. What justice or policy is there, for instance, in hiding under a compound duty some 76 per cent. tax on spool thread?

It is admitted that the revenue is not needed on this article of prime necessity, and it is very questionable whether fifty-two millions of people are ready to pay this enormous tax of 76 per cent on spool thread in order that the infant spool-thread industry should have a little longer protection. But it is just such a monstrous tax as that on spool thread that shows the glaring complications our tariff is subject to.

In revising the present tariff in the direction of simplification I must most emphatically protest against the retention of any compound du-

ties. There is no excuse for them. If it is absolutely necessary to tax an article 80 or 90 per cent., let it be stated openly and clearly, and not through hidden devices. If specific duties are really so essential to uphold the prejudices of ignorance, or, perhaps, more strictly speaking, to allay the fears of importers, let such articles be taxed in a specific form at least upon the basis of a three, four, or five years' average value in foreign markets.

In my own judgment the real triumph for tariff reform is simplification. And this policy I have aimed at more in the tariff revision I lay before you than extreme average reductions in duties.

Proposed revision of the tariff, based on the consumption of 1881.

Commodities.	Consumption, 1881.	Present duty, calculated ad valorem.	Revenue collected, 1881.	Proposed average duty.	Estimated revenue.

Domestic alcohol, only used in the manufacture of chemicals, shall be free of internal-revenue tax, under such rules and regulations as prescribed by the Secretary of the Treasury.

The above tariff should, in instances where it can be done, be made specific, but based upon the ad valorem basis herein specified.

Commissioner OLIVER. You recommend the schedule which you have appended to your argument?

The WITNESS. Yes, sir; and I shall be glad to explain anything or to answer any questions in reference to the statement which I have made.

Commissioner GARLAND. It seems to me that you have made yourself so perfectly clear that nothing remains to be added.

By Commissioner AMBLER:

Question. I observe that in your classification of duties on iron you propose specific duties; for instance, \$15 a ton on steel rails. What rate would that be ad valorem?—Answer. About 55 or 60 per cent. You will find that I do not propose to reduce any duty below one-half of the present rate unless I put it on the free list entirely.

Q. Still I believe it is pretty generally conceded that the duty on steel rails is one of the most exorbitant duties that we have?—A. Certainly, I agree with you that it is so; but I thought I would make my proposition practicable. I want to see something accomplished. The lower the duty on steel rails is made the better.

Q. Mr. Hewitt told us at Saint Paul that \$14 a ton would be sufficient duty on steel rails.—A. Yes. The price varies in England between £4 10s. and £6 10s. At present it is £5 10s.

Q. Is it your idea that steel rails would have been produced in this country to the same extent as they are now produced if it had not been for the high rate of duty put upon them a few years ago?—A. I am not ready to deny that the tariff on steel rails has given a great impulse to the manufacture of steel rails in this country. At the same time, I am decidedly of the opinion that as soon as the Bessemer patents ceased to exist the making of steel rails in this country would have taken a great head, and that we would have produced by this time as much as we are now producing. It is my opinion that the making of steel rails would have been greatly protected without any duty whatever. All that was necessary was to get rid of the patent; it expired in 1870. After that it was only a question of building rolling-mills and of making the rails. While the Bessemer patent existed steel rails were sold at from £18 to £20 in England. Then they fell to £12 10s., and that was the price for a long time. Of course, at that price they could have been made here.

By Commissioner OLIVER:

Q. What is the price of steel rails here now?—A. Forty-three dollars per ton. That only proves that this tariff system is not of such great

advantage to the manufacturer as we suppose. For instance, if there is a very great demand for steel rails we cannot make enough in this country, and we are obliged to make importations from England. During the last two years we have imported six or eight million dollars' worth of steel rails; but the moment the demand becomes slack, not only does the price go down, but we cease to import. It works in both ways, and so you cannot make prosperity with the tariff.

By Commissioner AMBLER :

Q. That is, when the demand is not so great but that it can be supplied by home manufacture, under a high tariff?—A. Of course, the home manufacturers take full advantage of the tariff when there is prosperity.

Q. They do not seem to be taking advantage of it now.—A. They do not.

Q. I want to get your opinion as to whether we would have produced steel rails to any great extent up to this time but for the high rate of duty levied on them?—A. It gave them all the advantage possible. But my opinion is that they would have produced just as much without the high duty. At the same time I will not insist upon it. I should be very glad to concede that the high rate of duty for twelve years has given all advantages to them. At the same time I know that they are a close corporation. There are eleven of them associated, and I know that four years ago the Vulcan Works of Saint Louis were paid by the association for not producing steel rails. That is to say, the workmen were thrown out of employment, and the owners were paid so much from the association for not producing steel rails. That is a historical fact.

Q. I want to know whether there was not, to some extent, a compensation for the high duty?—A. By all means. I say that the present duty has stimulated the increase of steel-rail production very largely. But what I claim is this, that it has lasted so long that by this time we ought to be ready to "crown the edifice," as the French say, so as to get some advantage from it. I do not want, by any means, to deny that the tariff has given a great impetus.

Q. And to the extent that it has given that impetus the tendency of protection has been to compensate for the evil of a high rate of duty?—A. Yes. In other words, what I claim is this, that we have paid very largely for protection during the last twenty years, and I think that the time has come now when a reduction should be made.

Q. Your idea is that, whatever may have been its advantages, the time has passed for its being of advantage?—A. Yes.

Q. And that the steel-rail manufacturers of this country are able to bear a reduction of the duty?—A. Certainly; and above all, simplification. The moment you simplify the tariff reductions will follow.

Q. You suggested that there were some things which you hoped you would be inquired of. You said something in that connection as to diamonds.—A. What I mean is that, from time immemorial, diamonds have been a great luxury, and that the reason why Mr. Walker's tariff fixed the duty on them so low was because they are so easily smuggled. I merely wanted to point out that there was no contradiction or inconsistency in that.

Q. Is there anything else that you desire to state?—A. I did not mention quinine. The Commission might like to hear something about it.

Commissioner AMBLER. We should be very glad to have any information that you may possess on that subject.

The WITNESS. Quinine is subject to a very low profit. A profit of 5 per cent. is considered very large. It is a staple article. Every drug man must have it. Now, let us see how the thing would work at a 10 per cent. duty. The American quinine makers could actually have the monopoly just the same as they had before the duty was taken off. Suppose that quinine cost in England 8s. an ounce—that is \$2; add 10 per cent. duty and the price is \$2.20. If the American quinine manufacturers put the price up to \$2.50 (which would give them a large profit), the druggists and speculators would immediately telegraph to England for, say, 5,000 ounces. This would be laid down here at \$2.20 an ounce. As soon as it becomes known that foreign quinine has been brought here the American producers drop the price by 25 or 30 cents, so that the importer cannot dispose of his quinine except at a loss. The importer ceases to import quinine, and, immediately, up goes the price to \$2.40. That game is played half a dozen times or more, until the importation of quinine is entirely broken up.

By Commissioner MCMAHON:

Q. In case of quinine being admitted free, what is to prevent the American manufacturers doing the same thing and dropping the price below that at which the quinine has been imported?—A. They might do that, but the consumers would have the advantage of it. At the same time experience shows that they do not do so. They have not done so for the last three years.

Q. Then the existence of the duty did not make them do so, nor its non-existence prevent them?—A. I claim that quinine can be made as cheap here as in Europe, but the tariff would make it artificially dearer.

Q. But cannot the American quinine manufacturers shut out importations and have monopoly even if quinine is duty free?—A. That would cost them too much money.

Commissioner AMBLER. Your idea is that the ordinary reasonable profit being only 5 per cent. a duty of 10 per cent. is exorbitant?

The WITNESS. Yes, sir.

By Commissioner MCMAHON:

Q. Then you assume that the manufacturer here is never going to charge for his quinine beyond 5 per cent. more than it costs him?—A. I presume so, and sometimes less. I give them all that they ought to have.

Q. You mean to say that they have got to make a profit of 5 per cent. ?—A. They will make that. Besides, it must not be denied (and probably it is on account of the tariff) that the quinine made by Powers and Weightman and by Rosengarten & Sons not only compare favorably with the foreign quinine but is superior to it; that is to say, the quinine made in this country is a favorite brand.

Commissioner AMBLER. It is said that the foreign quinine business is entirely or substantially a monopoly; do you understand how that is?

The WITNESS. I believe that a man named Meyer, in Milan, undertook to make a "corner" in the bark; but these "corners" do not last. They could not make the bark rise quickly enough, and so they bought up the quinine; and we should have been in a queer position here if we had not had a large stock of quinine on hand. We have now from 400,000 to 500,000 ounces always on hand.

Commissioner AMBLER. It is claimed by the quinine makers here that they absolutely cannot, without some protection, compete with the foreign monopoly. They claim that the man Meyer has, substantially,

made a combination between the six or seven quinine manufacturers in Europe, and that they cannot compete with that combination. If that be so, and if the effect of maintaining quinine on the free list should be to stop the production of it in this country, it is then evident that, instead of two monopolies that have to compete with each other, there would be but one monopoly.

The WITNESS. Please tell me how in the world you can stop this monopoly by putting a duty on quinine.

Commissioner AMBLER. I am not saying that you can. I am suggesting to you a hypothetical case which has been suggested to us. I beg you to understand that I know nothing about quinine and its manufacture, except as it has been detailed before the commission from time to time. I do not know whether the quinine manufacturers here speak correctly when they say that they cannot produce quinine in competition with the foreign manufacturers. They claim that the production of quinine in Europe is a monopoly, and that there are but few concerns in this country making quinine, and that they are making it in competition with each other; and that if we should extinguish the branch of the monopoly on this side by legislation it would give the branch on the other side a better chance. What is your judgment in that respect?

The WITNESS. My judgment is that if you put back the duty of 10 per cent. on quinine enterprising young men will come over here from Europe and will make a combination. The moment a tax is put on the danger of combination becomes greater.

Commissioner AMBLER. If they make quinine here as cheap as there, and if it is in the hands of some eight or ten persons (taking the world over), I cannot see why a combination cannot be made between the American and foreign manufacturers, even if quinine be on the free list.

The WITNESS. I do not think that a combination is likely to take place. I believe that this man Meyer has bought up the Pelleriers, but there are some of the European manufacturers whom he cannot buy up. I believe he cannot buy up Howard & Sons. I do not think that a duty on quinine can prevent any such contingency. In fact no legislation can prevent combinations or "corners."

By Commissioner AMBLER :

Q. You believe that, with the duty off, there is no possibility of combinations or "corners"?—A. I do. With the duty off there will always be people to consign quinine here. Mr. Rosengarten, a gentleman 82 years old, wrote a very remarkably temperate letter to the Evening Post on the subject of quinine, in which he stated that the importation of bark here from South America has ceased. The facts are that in the three years from 1876 to 1879, when there was a duty of 20 per cent. on quinine, and when bark was free, the importation of bark was 13,218,948 pounds; while for the last three years, from 1879 to 1882, with quinine free, the importation of bark was 15,386,305 pounds.

Commissioner MCMAHON. It was suggested to the commission that a large part of that imported bark was for prospective use.

Commissioner AMBLER. Yes; it has been said that that was not the ordinary importation; that it was an abnormal condition of things resulting from large speculations.

The WITNESS. We may as well be perfectly clear about quinine. Let us see how much we imported and consumed, and how much we really made. The consumption has been stated to the commission at

1,400,000 ounces. There was imported for consumption in 1881 408,000 ounces; so that it would seem the American quinine manufacturers still made 1,200,000 ounces of quinine, which would be perfectly in accordance with the importation of bark. Of course we use more than 1,400,000 ounces of quinine annually. We use 1,600,000 ounces. But suppose we use only 1,400,000, then one-third is imported and two-thirds is made here.

By Commissioner McMAHON:

Q. There is something about your list of duties which I do not understand. Take class 7 for instance. The present rates now range from 49 to 71. Is it your idea to let the present rates continue?—A. Yes; there are some articles in that class which I thought ought not to pay any duties at all.

Q. Take class 1, "textile fabrics." What provision have you made for a composition of materials?—A. I must say to you very frankly that I leave this cotton section to enumeration; that is, the rate should be as it is now—on the component part of chief value.

Q. You know, as a matter of fact, that the great difficulty (equally annoying to the importer and to the government officer) is the question of the dividing line—as to which is the component part of chief value. Have you anything to suggest on that point?—A. No; I have not made any suggestion. That comes under the rule of simplification.

Q. And you have stated that as the most important of all?—A. Yes, sir.

Q. Then you mean to say that you propose cotton textiles to pay 25 per cent. absolutely ad valorem?—A. Yes, sir.

Q. And woolens 45 per cent.?—A. Yes, sir.

Q. And silks 45 per cent.?—A. Yes, sir.

Q. And manufactures of iron and steel 35 per cent.?—A. Yes, sir.

Q. Then if we have a fabric containing cotton, silk, wool, flax, and metal all combined, what suggestion do you make for such an article?—A. I would suggest a new schedule for these mixed goods. I think that that would not be a bad idea.

Q. You make out a very good case (it appears to me) regarding the hardship on the cotton grower in the matter of cotton-ties. Would not that be entirely obviated by allowing him a drawback on the ties and baling?—A. Who would get the drawback?

Q. If he has it reimbursed to him, would it not do away with the objection?—A. The great objection to the drawback system is that it leads to all sorts of frauds.

Q. Explain what you mean.—A. I think that advantage would be taken of it. I know that it has been found very difficult to arrange as to the drawback on sugar. But I fail to see, in this cotton-tie business, who should get the drawback. In the case of cotton-ties and jute bagging who would have the advantage?

Commissioner McMAHON. The planter would have the benefit. There is no doubt about that. Does he not pay the duty now, in effect?

The WITNESS. Certainly.

Commissioner McMAHON. If you take it out of the Treasury and give it back to him when he exports his cotton, would not that be reimbursing him?

The WITNESS. But suppose he uses a home-made cotton-tie?

Commissioner AMBLER. He need not, unless he gets it as cheap.

The WITNESS. He would buy it just the same and get the drawback. There is another complication. How is the planter to know that the

man who "gins" his twenty bales of cotton uses foreign or home-made cotton-ties? If he is to have a drawback, let him have it on all cotton-ties, whether made abroad or in Pennsylvania or Ohio.

Commissioner AMBLER. Then, do you recommend that cotton-ties shall be imported free?

The WITNESS. I do not. It will not do any harm to let them pay 35 per cent. We cannot do everything at once. We must not take a step from one extreme to the other.

By Commissioner MCMANON:

Q. In class 4 you speak of brandy and spirits, all as spirits, at \$2 a gallon. What is meant by the term "spirits," in the first line, as contradistinguished from other items?—A. It includes absinthe and similar liquors—cordials, liquors, arrack, &c.

Q. You have made no provision for playing cards?—A. They would come in under the 25 per cent. clause.

Q. In class 4 you leave the duty as it is on still wines, and you raise it on champagne only?—A. Yes. The reason why I propose to raise it on champagne is simply because it pays less duty now.

Q. I see that you propose an ad valorem duty on sugar, and that you retain the Dutch standard alone.—A. I do; for the simple reason that sugar of No. 13, Dutch standard, is easily defined.

Q. We have been told that the polariscope test is the test universally adopted in the markets of the world to determine the value of sugar?—A. Yes.

Q. And that the quotations that are published daily from the various markets of the world are based on the polariscope?—A. Yes.

Q. Then, do you think it advisable to recommend Congress to enact a law fixing a duty on sugar on the ad valorem basis, and on the Dutch standard, when the commercial basis is the polariscope test?—A. I do not care so much for lower duties as for simplification. This suggestion is subject to consideration. If you can add to the simplification, do so by all means. But I have aimed at only two rates in the taxation of sugar, because it is claimed that a manufactured article above No. 13, Dutch standard, should have a higher protection than raw sugar.

Q. Then your recommendation would be a combination of the two systems?—A. Most decidedly. But the objection to having the polariscope test, pure and simple—the Boston plan—is that it is too complicated. In this instance, if you make it an ad valorem duty, it is not complicated, because if the sugar below No. 13, Dutch standard, costs in India 3 cents a pound, it would naturally come in at 40 per cent., while the sugar that costs 6 cents a pound would come in at 50 per cent. So long as you have got it ad valorem you have got it right. But I have no objection to the polariscope test.

Q. Have you taken into consideration, in recommending a purely ad valorem system on silk, the years of controversy that have passed as to the valuation of silk fabrics?—A. I have given the matter my study for fifteen years. I had the whole establishment of the late A. T. Stewart at my disposal, to give me all the aid I wished, and I came to the conclusion that some silk would come in under a specific duty, at 25 per cent. ad valorem, while other silks would pay 80 or 90 or 100 per cent.; so that the better qualities would pay the least duties.

Q. Is not the same thing the fact as to cigars, where you do recommend specific duties? Would not the rich man, who bought the best cigars, pay the least rate of duty?—A. Yes; but I think that a specific duty is the best duty for cigars.

Q. We have had specific duties recommended for silk. Would not the natural effect be to cause a discontinuance of the "loading" of silks? Would not all consumers, in effect, get better silk, and would not the richer classes, which can now afford to buy the heavier and better silks, get them without being "loaded"?—A. There is to be said about silk, the manufacturers are obliged to "load" the cheap silks, otherwise they would look like a rag. The article must have a good appearance. It must be "loaded" so as to give it a gloss. The poorest silks could not come in unless they were loaded.

Q. Is not the "loading" more to give the silk the appearance of weight and substance than of finish?—A. Most decidedly. For a 4-franc silk there cannot be a sufficient amount of silk put in, and so it has to be "loaded" in order to give it an appearance.

Q. Then the effect would be to have ramie fiber or cotton put into the silk fabric?—A. The practical effect would be simply this: that this country would have a monopoly of the lower classes of manufactures of silk.

Q. Have you considered the question of the undervaluation of silks in making a recommendation that a pure ad valorem duty be put upon it?—A. Yes. And I have come to the conclusion that there is no reason why the Government, with all the powers at its disposal, should not be able to get experts who are as good judges of articles as importers are able to get. For sixteen years I have been, not exactly in the custom-house, but I have known people who are employed there, and I can say that, as a whole, these custom-house officers are more sinned against than sinning. Now and again there may be some collusions with them, but I believe that the Government can get reliable experts, who will carry out the laws honestly. As to undervaluations there may be, now and then, cases of that kind; but it is not worth while to disarrange a whole system for the sake of some solitary cases.

Q. Then your experience and study lead you to the opinion that there is more cry than wool in this matter of undervaluation?—A. Most decidedly. There always has been. I happened to have a room next to the one where the late Mr. Jayne used to arrest people, fourteen years ago, and I found that nearly all these custom-house offenses were as to articles that came in under specific duties. There is where the collusion came in. An honest appraiser, if he has any doubt as to the value of the piece of silk for instance that he has got in his hands, keeps it for two or three days, and inquires of some of the first-class importers, and institutes comparisons with other silks, of which the value is ascertained. This outcry of undervaluation is nonsense.

Commissioner McMAHON. It has been stated to us that almost all the silks that come into this market are sent here on consignment, and that under that system government officers have no means of judging of the value of the silks except by comparison with the domestic silks and with a few job lots that are purchased here and there; that they cannot ascertain the market value at the place of shipment; that the manufacturers make a market value to suit themselves; that that market value is possibly below the cost of manufacture; and that thereby the American silks of the same quality are excluded from the market.

The WITNESS. Of course that state of things would require on the part of the appraiser a knowledge of the importation business. I should not be at all surprised if a good deal of the silks imported are consigned and sold in the way that you mentioned. At the same time I still persist in the opinion that the general knowledge of a good ap-

praiser, having the means of judgment at his disposal, cannot be deceived to the extent that is generally supposed, and that, after all, the ad valorem system is the best. By the system of specific duties some difficulties might be avoided, but it would produce other hardships. It would exclude a certain amount of foreign silk, and the domestic silk manufacturers would probably give over making the higher qualities of silk, because the lower qualities would give them higher profits.

Commissioner McMAHON. I refer you again to the matter of cigars. What is the price of the cheapest Havana cigars?

The WITNESS. The average price of cigars in Havana is about \$60 a thousand. They weigh about 10 pounds, and pay 50 per cent. duty. Suppose you make the ad valorem rate 70 or 80 per cent.; the idea is simply to do away with compound duties.

Commissioner McMAHON. Admitting that silks are to a certain extent luxuries, and that cigars are also luxuries, then I think that, under your suggestion, the price of the poor man's cigars would be increased.

The WITNESS. Then he can smoke a pipe.

By Commissioner PORTER:

Q. You stated something in your address about diverting surplus capital from the young Western States to the manufacturing States. Is it not a fact that during the decade from 1870 to 1880 the manufactures of the Western States (including the two States which you have mentioned, Iowa and Minnesota) have increased by a greater percentage as to the number of establishments, the number of hands employed, the amount of material consumed, the wages paid, the capital invested, and the production, than those of any other States; and that, taking the Western States as a whole, the increase of manufactures has been more than double that in the manufacturing States, including the New England and the Middle States?—A. I can very well understand that a State like Minnesota, which had 100 manufactories ten years ago, may have 200 manufactories now (an increase of 100 per cent.), while Rhode Island, starting with 2,000 manufactories, could not show such a percentage of increase.

Q. Allowing for that state of facts, I ask you whether, all through the Western States, manufacturing has not, during the last decade, kept pace with agriculture?—A. Still money is naturally diverted by these abuses from these young communities.

Q. And yet they have increased their manufacturing interest more than the Eastern States?—A. They have made a higher percentage of increase, because they had little to start from.

Commissioner PORTER. That agricultural section of country is really becoming a largely manufacturing section, particularly as to such States as Illinois and Ohio?

The WITNESS. I do not deny the prosperity of the country. I have not said in my address that the country is suffering.

Commissioner PORTER. But the point I make is as to the diversion of the savings from those States. You must admit that manufacturing has increased in the Western States at double the ratio that it has increased in any other section of the country during the last twenty years. There must, therefore, be some of the surplus savings retained in those Western States. It cannot all have gone into the hands of the millionaires of the East.

Commissioner UNDERWOOD. I have listened with interest to your address. You are in favor of simplifying the tariff so that not only ex-

perts and government officers, but everybody else may understand what is taxed and at what rates.

The WITNESS. Yes. If you can accomplish that no man will rejoice more than I at such an achievement. The simplification of the tariff is of more importance than its reduction. There is now a great deal of suspicion thrown on government officials which has no foundation. If you simplify the tariff that suspicion will pass away, and the civil service of the government will be elated by it. The simplification of the tariff is of the first necessity.

By Commissioner AMBLER:

Q. I see that, after putting all other manufactures of iron and steel at 35 per cent., you put steel rails at 60 per cent. What is your reason for that distinction?—A. The reason is that all these other articles are now paying from 30 to 50 per cent., while steel rails are paying a much higher rate. I did not want to make the reduction too disproportionate.

Q. I find that you put all the metals and manufactures thereof (except on pig copper) at 25 per cent. Now there are very many manufactures of iron that ought to have as high a rate of duty as steel rails.—A. The term "other metals" means articles such as brass, &c.—except pig and pure lead and ingot copper. I put them down 5 per cent. I put copper on the free list. It has been taxed too long. There is no country in the world so rich in copper as this. Nature, in placing it here, did not do so for the benefit of two or three corporations, but for the benefit of the whole country. The idea that copper, which costs 11 cents a pound, should be made artificially dear is an outrage.

Commissioner AMBLER. One of the things complained of about this commission is that it is said that we take sides. Now, I am not taking sides, but I really desire to know why you make that discrimination. It would seem to me that the manufactures of brass, &c., should pay as high rates of duty as the general manufactures of iron.

The WITNESS. If you give them free copper, I do not know but they ought.

By Commissioner AMBLER:

Q. I come now to class 6, "earthen and stone and China ware." You say that it has had an average rate of 45 per cent., and you propose to reduce it to 35 per cent.; that is to say, you reduce it below the rate of a number of items above there. I want to know the reason.—A. The reason is simply that these goods are protected by a rate of from 18 to 20 per cent., and by 50 per cent. in freight. The common goods are really protected 100 per cent. in freight.

Q. Are the rates of freight on earthen and China ware so greatly different from the rates of freight on iron manufactures?—A. Iron is not so bulky as China ware. A crate of plates will cost in England £2. The crate itself will cost 10 or 15 shillings, and I have not the least doubt that the freight would be 15 shillings, because the measurement of that crate would be at least a ton or a ton and a quarter. The crate is a very great item of cost in crockery.

Q. You are quite correct as to the lower grades of crockery, but on the higher grades of crockery and China, I presume that the freight is as low as it is on general manufactures.—A. Oh, no. The freight on crockery will always amount to at least 10 per cent., and 35 per cent. is a very great protection on the manufactures of China and crockery.

Q. This, I believe, is one of the youngest industries in the United

States, is it not?—A. I do not know. The practical question is not whether the industry is young or old, but what rate of duty will protect it.

Q. The schedule which you recommend evidently does recognize the principle of protection, does it not?—A. There is a reason for it. As to the article we are now on, I say that it is protected by freight—by geographical protection. It therefore does not need so much tariff protection. On the other hand, the freight on silk is not so much as 1 per cent.

Q. "Glassware of every description" is in the same schedule?—A. I leave that as it is.

Q. What is the relative geographical protection on glassware and on China?—A. I do not think that on glassware the geographical protection is more than 5 or 6 per cent.

Q. Take the current run of glassware, and does it not require as much in the way of protection as the general items in your list?—A. I do not think it does, because we only import the better class of glass goods, and very little of them.

Q. And on that better class of goods (of which we import very little) your schedule proposes a protection of 46½ per cent.?—A. I leave the duty just as it is.

Q. If there is any reason why that duty should not be included in the general reduction I should like to know what it is?—A. The reason is, probably, that we import a better class of goods. The duty on bottles is now 35 per cent., and bottles and jars filled 30 per cent. I do not propose any change in them. Where the classification is really good, it should be maintained.

Commissioner AMBLER. That is what I thought, but I am rather inclined to think that your disposition to lower rates of duties has prevented your being consistent all the time. You suggested that you did not want copper protected, but I see that in class 9 you retain the duty of 3 cents per pound.

The WITNESS. That is a mistake, and I am sorry for it. I will take it out now. I suppose that the reason why I did not put copper ingots on the free list is that I wanted to carry something.

Commissioner AMBLER. Of course the value to us of your schedule depends upon the consideration which you have given to it, and upon the reasons that have influenced your judgment.

By Commissioner McMAHON :

Q. Do I understand that this free list of yours is in addition to the existing free list?—A. Yes; I wish to explain how this schedule came to be in existence at all. Mr. Hewitt suggested in his speech in the House, that raw materials should be on the free list, and that there should be a general reduction of the tariff. Then a certain meeting took place, which resolved that Mr. David A. Wells and myself should draw up such a document. I drew it up and Mr. Wells was to write a preface to it, but he did not do so. The thing went on from day to day, and when I resolved to go before the commission, I struck out something from the schedule which I had drawn up, so that there might be a probability of its being adopted. It is the same schedule that I had at Long Branch. At the same time it is in the right direction. If any modifications are suggested in it I do not know why they should not be accepted.

By Commissioner AMBLER :

Q. Was this schedule the result of a consultation?—A. It was the

result of a consultation with David A. Wells. He was to write a preface to it, which we were to print and lay before the people.

By Commissioner GARLAND:

Q. If I understand your schedule, it proposes rates of duties lower than the present ones?—A. Yes; with very few exceptions.

Q. Then do you not thereby admit the equity of the present system, except that you think the duties are too high?—A. I find fault with the present tariff more for its complications than anything else. My proposition is to simplify the tariff.

By Commissioner MCMANON:

Q. What do you mean by the term "fancy goods" in class 9?—A. Fancy articles, such as spar and alabaster ornaments, dolls, fans, flowers, meerschaums, &c.

Q. Would it not be necessary to specify them?—A. If I had to specify every article in the schedule which I submitted it would be as big as the tariff itself.

Q. Do you think that you would simplify the tariff by leaving questions open to dispute between importers and custom-house officers, as to what fancy goods are?—A. That can be defined. There is no trouble in defining them. I do not see any reason why they should not be left among the "sundries."

Q. Do you call beads fancy articles?—A. Yes.

Q. Then they ought to pay 25 per cent. All beads now pay 50 per cent. Is that right?—A. That is right.

Q. You also say "glassware of every description?"—A. I leave that as it is.

Q. What would a glass bead be?—A. "Bead" is a separate name for it.

Q. I understand you to propose that "glassware" shall remain as at present. A glass bead is "glassware," but you propose to take it from under the general head in the existing tariff and to make a special provision of 50 per cent. duty under the head of "beads of all descriptions." Now you say that your term "fancy articles" will include beads?—A. Certainly.

Q. Then "beads" will pay 25 per cent.?—A. But it will not be designated or named. When I say "glassware," I mean all the articles that come under schedule D, and "beads" come under schedule M.

Q. You have not provided for glass beads?—A. Yes, I have; under "fancy goods," at 25 per cent.

Q. But you have not specified them by name?—A. That is not necessary.

Q. Do you mean to re-enact the present tariff and to use the present schedule, when you say that in the term "fancy articles" are included all the articles named in schedule M in the old tariff?—A. Certainly. I do not wish to disturb the present schedule at all, except to put an additional section to it.

Q. Do I understand that the tariff recommended by you would be a repetition of the present schedule, word for word, with the exception that, instead of giving compound rates of duty, you would put on one ad valorem rate of 25 per cent.?—A. Yes; that is generally the idea.

Q. Then, in order to make that term "fancy goods" clear, you would have to enumerate the articles by name?—A. Of course you would have to enumerate them, except chemicals. If you take out the chemicals from that schedule M, you will have few things left except fancy goods; and

they are proposed at 25 per cent. They are all in one class, whether they are heads or anything else.

By Commissioner OLIVER:

Q. You have been an officer in the custom-house?—A. Yes, sir.

Q. And you have always paid a good deal of attention to economical questions appertaining to the tariff?—A. Yes, sir.

Q. Then you have had the advantage both of a practical and theoretical knowledge of the question.—A. You are paying me a compliment.

Q. Do you not think that, in your admiration of Robt. J. Walker's tariff and policy, you have become wedded too strongly to the ad valorem principle?—A. No, sir; I do not think so.

Q. Do you know that all importers, with scarcely an exception, who have appeared before the Commission, including the members or representatives of some of the largest firms in the country—notably, Mr. Field, of Chicago—unite in recommending specific instead of ad valorem duties?—A. The reason for that is, so far as the importers are concerned, that, so long as they have got the ad valorem system under the present law, there is no finality to it. There seems to be no end to it. A man who has imported goods under the ad valorem system, and has put them in his store, does not know but that in three or six months somebody will come and rip up the whole affair.

Q. Do you not know that the great trouble with merchants has arisen in respect to goods imported under the ad valorem system?—A. Yes; as to the disputes. But, as to actual frauds, the large frauds that have been committed have been committed under the ad valorem system—whether in sugar, spices, or any thing else.

Q. Mr. Field stated to the Commission, in Chicago, that although he had what he considered as perfect a system as could be devised for purchasing goods abroad, it was impossible for him to purchase any quantity of certain styles of goods from the manufacturer abroad, but had to buy them from the manufacturer's agent in New York. If the duties were lowered under the specific principle instead of the ad valorem, do you think that that trouble would exist?—A. Of course it would not exist. But what I maintain is, simply, that the reason why the ad valorem tariff should be adopted is that a fair assessment of the value of the goods can be nearly arrived at. The question is what "market value" means.

Commissioner OLIVER. The point which I wish to present to you is this: You are recommending to the Commission to recommend to Congress, not only in reference to silk and woolen goods (where there are no difficulties as to levying duty by weight or measurement), but to many other articles where specific duties are practicable, that the ad valorem system shall be adopted. You are therefore recommending a change which would increase the annoyances and troubles which the commercial community is now laboring under.

The WITNESS. I suggest that the tariff shall be made specific where it can be done, and shall be based on the ad valorem principle. I do not object to specific duties, provided you can base them on the ad valorem plan.

By Commissioner OLIVER:

Q. At the time that the Robert J. Walker tariff was passed there were few custom-houses in the country. There is a very great difference between that period and the present. I see that the total revenue estimated from your schedule is \$135,000,000. That would leave \$200,000,000

to be raised from other sources. How would you suggest that it should be raised?—A. I assume that the internal revenue, so far as spirits and tobacco and beer are concerned, will not be given up. In that case there is no doubt that from \$100,000,000 to \$110,000,000 can be received from those articles. Besides, if Congress were to adopt the basis of this schedule, I am perfectly satisfied that instead of \$135,000,000 it would produce \$175,000,000. If we cannot measure our importations under these reduced rates of duty, then I do not know what our protectionists would have to complain of. There would be no trouble about the revenue, always provided the internal taxes be kept up on these three articles.

Q. Then you do not recommend a reduction of the tariff to such a point as to make the continuance of the internal revenue system a necessity?—A. Certainly. If the government needs more money than \$150,000,000 or \$160,000,000, I must certainly say that there are no other means of obtaining it than from the internal-revenue system. It would be very difficult under any circumstances to devise a tariff that would produce enough revenue to carry on the government without the internal revenue. You could raise \$250,000,000 or \$300,000,000 from the tariff; but the moment you increase the present duties you stop importation. You can increase the revenue from the tariff by raising the duty on sugar and putting a duty on tea and coffee. But if you increase the tariff on cotton goods or silks you will find that the increase of revenue from that source is very small, and you could not raise enough revenue from the tariff to maintain the government.

By Commissioner UNDERWOOD:

Q. You propose to place articles on the free list that are now paying revenue, thus making it necessary to continue the internal-revenue system?—A. The whole free list would only amount to \$13,000,000.

Q. Why throw it away?—A. Because you give prosperity to the manufacturers by giving them a free list.

Q. I thought you were opposed to protection?—A. I do not call it protection; I call it prosperity.

Q. Have you thought of this question: That by increasing the free list and by reducing the duties to a point that will reduce the revenue to \$135,000,000, you would necessarily augment the amount of imports into this country, and create a danger that the balance of trade would be against us? Do you think that that would be desirable?—A. The reduction of duties will not necessarily augment the importation of goods. It will only give us cheaper goods. I am sorry to see that the balance of trade is growing against us very fast at the present moment, with the highest rates of duties that the country has ever seen. I have seen publications showing that our imports are larger than our exports.

Q. Is that a desirable state of things?—A. Your high tariff does not prevent it.

Q. I do not say that it does, but the question which I asked was: Is it a desirable state of things so to arrange the tariff as to make the balance of trade against us?—A. I do not know that it would be against us, but even should it be, I think that the more you are able to import the more you will be able to export by the opening of new markets.

Q. What will we export?—A. Everything that we make.

Q. We cannot find a market now for our surplus wheat.—A. I wish that we shall export manufactured goods. Australia sends wool to this country. Is there any reason why we should not have trade with Australia? But we pay in cash for her wool, and that is the reason why

the balance of trade is against us. We do not send goods to Australia to pay for her wool.

Q. But suppose we protect our wool interest to such an extent as that we raise all the wool ourselves?—A. I think you will not raise the classes of wool that we receive from Australia. There are certain classes of goods that cannot be done by protection or anything else.

Q. These articles that are brought in under the free list, do they not have to be paid for?—A. Certainly.

Q. These are imports which we are paying for and getting no revenue from?—A. Certainly.

Q. What I understand of trade reformers is that they want a revenue tariff. Does not that endanger the creating of the balance of trade against this country?—A. Not at all. All that it does is to give manufacturers more scope by making their manufactures cheaper. We maintain, as revenue reformers, that \$150,000,000 of revenue from imports is needed for the expenses of the government. We propose that "no more money shall be collected than is necessary for the maintenance of the government, economically administered."

Commissioner UNDERWOOD. That is simply "a glittering generality."

The WITNESS. If there be no money in the Treasury, Congress cannot expend it. Congress cannot go and throw away the money.

Commissioner AMBLER. That has been done sometimes.

The WITNESS. Then the men who do it will be left at home. The time has come when a reduction of these war-taxes can be safely made. Above all; a simplification of the tariff should be made; and of that I shall be very glad. I am not a merchant or importer, but I have written a good deal about the tariff. I have studied it, and my whole aim has simply been to give to this country a simple tariff. Far from desiring to injure the industries of this country, my sole aim has been to see higher rates of wages paid in this country, and the articles used by the poorer classes made cheaper; so that the working men would have the benefit in both ways. If I can aid the Commission in any way, publicly or privately, I am ready to do so. I am ready to work at it night and day, with the greatest pleasure. I am not entirely wedded to the list which I have presented.

By Commissioner MCMAHON:

Q. What would an article pay, under your schedule, about which there was some dispute some time ago—the article of ozier cases—I mean cases containing perfumery bottles. These cases were made of wood, and contained also rattan, straw, cotton, silk, iron, steel, brass, glass, and paper. You propose the rate of 25 per cent. on cotton, 45 per cent. on silk, 35 per cent. on iron and steel, 40 per cent. on glass, and 15 or 20 per cent. on paper. Tell me what rate that box would pay.—A. I should do just as Alexander did 4,000 years ago; I should cut the gordian knot, and say, let it pay 25 per cent. The great misfortune of our tariff system has been this: that we have been too punctilious; that we have looked at the matter too seriously. A stand should have been taken. Common sense should have decided the thing.

Q. The common sense of the importer might suggest one thing, and that of the custom-house officers another thing. Which common sense should we take?—A. I suppose that if you were Secretary of the Treasury, you would put it under the head of "goods not enumerated or otherwise provided for."

JOSEPH LYMAN.

NEW YORK, *October 3, 1882.*

Mr. JOSEPH LYMAN, representing the firm of A. A. Low & Bros., importers of teas, raw silk, hemp, jute, sugar, and China sundries, submitted the following statement:

Whatever matter of facts or of argument I have to present to the consideration of the honorable members of the Tariff Commission have been prepared in the belief, 1st, that it is the common sense of the people of the country that our tariff should be simplified and all unnecessary taxation relieved, and that for such purposes the present Tariff Commission was organized; and, 2d, that it must be the wish of such a Commission to hear the case of special articles upon which the present revenue is collected, as well as to listen to the specialist in tariff.

In such a belief, and because I take it for granted that the amount of revenue collected is now largely in excess of the country's requirements, and is the primary cause of the people's discontent with the present tariff, I beg to present the facts relating to several articles of commerce, with which I have had a special experience, and from which, as it seems to me, the burden of taxation may be properly removed. The articles I especially refer to are manila and sisal hemp and jute and jute butts; but I must ask permission, also, to make mention of certain anomalies or difficulties of revenue collection known to me in the case of other articles.

Jute and jute butts.—Jute grows as a stalk of 10 feet or more in height. Its bark is stripped and macerated and the dark outer bark removed. The soft inner fiber has the butt end cut off, and is then baled and shipped as jute, for the most part to England. The butts or cuttings come chiefly to our own country.

Jute is manufactured into cordage and twines, and into the yarns of which are woven the so-called hemp carpets, the jute curtains and cloths, and various sorts of grain and coffee bags, and gunnies.

Jute butts have two principal uses in manufacture, viz, 1st, the so-called manila paper, and, 2d, cotton bagging or domestic gunny-cloth. Jute pays duty of \$15 per ton, or, say, $\frac{3}{8}$ cent per pound. Butts pay duty of \$6 per ton, or, say, $\frac{1}{4}$ cent per pound.

The present import of jute into this country (1881, 61,843 bales) is insignificant in comparison with the import of the article into England (1881, about 1,400,000 bales), whose market fixes the value practically in India. The average import to the United States in past ten years has been about 46,000 bales; but, assuming the average at 60,000 bales per annum, the duty collected (at 2.50 per bale) would be \$150,000 per annum.

The United States are, however, the largest consumers of the cheaper commodity, viz, jute butts or cuttings, which have, in some degree, a reflexive influence upon the values of the rest of the stalk and *vice versa*.

Our import of butts in late years has run very nearly up to 275,000 or 300,000 bales. We will accept the largest figure, for convenience, and the duty paid thereon (at, say, \$1.08 per bale) will be \$326,000. The

actual duties, even with an increase lately in the weight of some of the bales, will not differ materially from the above figure.

The import of the two articles together—jute and jute butts—thus produces in the revenue somewhat less than \$500,000. This is approximately correct, and is much less than has been represented by most newspaper correspondents and by special schemers.

This amount is fairly a portion of your surplus revenue; and the expense of its collection is excessive, being largely disproportionate to the amount collected. It is revenue which taxes the consumer of all jute twines, ropes, and yarns, all hemp carpets—which are of the cheaper sorts, and go especially into the homes of the working people—all manila papers, grain bags, and cotton cloth.

There are, as I believe, no vested interests which can properly demand a tax on those two sorts of raw fiber. The flax growers of the West secured the replacement of the duty upon jute butts in 1875 (act of February 8), because, as I am informed, Senator Sherman was persuaded that the flax crop of his friends was in peril. One-third to one-half of the butts import (representing less than \$100,000 of revenue at that time) passed into the manufacture of the rough cloth used to cover cotton, and it was thought that flax could be used, in whole or in part, for that purpose. The attempt has been made, and it is perhaps needless for me to say with what result. Nearly all the cotton exchanges of the country—in all parts—have expressed, by rule or resolution, a strong disapproval of the use of flax in any percentage whatever.

But the cry comes from the Louisiana newspapers that the jute crop can be made valuable to that part of the country, as its very own! I have heard that cry personally for about ten years; but it may have been as “music in the air” to others for a much longer term of years. I can say, however, that I have yet to see a bale of jute or of jute cuttings of our own native production, and I have read or heard of only 4,000 pounds—or the equivalent of 10 bales—which appear to have been raised as an experiment, and were reported by the Commissioner of Agriculture in his work on the products of Louisiana.

The selling price of jute in New York to-day varies, in respect of its quality, from $3\frac{1}{2}$ cents to 5 cents per pound. This value includes everything—first cost, baling, foreign commissions, freight, banking, and home commission, and duty.

The selling price of jute butts (and rejections) in New York to-day is, in respect of quality, from $2\frac{3}{4}$ cents to $2\frac{1}{2}$ cents per pound, and my hearers will agree with me that neither value offers vast encouragement for competition so long, at any rate, as hand labor rules as the necessity in the preparation of the fiber.

Of these values $1\frac{1}{2}$ cents to 2 cents, perhaps, go into the hands of the jute grower of India. The rest is absorbed by the vested interests of packing, commission, and banking houses, by the freight to the vessels which carry the bales, and by the tariff of the United States.

If that tariff remain the same, interests which are now vested in the use of the article will doubtless continue to accommodate themselves to the circumstances, and somehow secure from the consumer a living from their manufacture.

If the tariff be increased there seems but little doubt that the process of manufacture must be checked, and the interests which now import jute and jute butts to this country, in whatever branch of the business, materially suffer.

If the tax be removed it should help, with the removal of the numberless and unnecessary other taxes—which now serve only to bleed

the consumer and enhance materially the cost of labor—to stimulate and energize vastly our manufacturing interests and assist materially the competition with England and Scotland. There should be, in that event, a much larger use of jute itself, and America might then manufacture more than 5 per cent. of the jute export and 25 per cent. of the whole crop—jute and jute butts.

The "Calcutta man," or British iron ship, which carries the produce of India, is as distinctive a type of vessel as the three-masted schooner which trades along our coast. Every 5,000 to 6,000 bales of jute or jute butts means a vessel to bring them to our ports. Already our import requires 60 to 100 craft for its transportation, and of that quantity the larger proportion by far is now British, where once it was American. Give our manufacturer untaxed raw fibers to work with, and give our ship-builder and ship-owner an equal chance with those of foreign lands, and you take the proper steps toward the building up of an American commerce.

The question of labor and the high cost of it must be left to a proper adjustment when the consumer has been relieved of all unnecessary taxation, over and above what is actually required for the revenue of the country, and for a proper protection of young and feeble industries. And I speak of labor and its cost because I deem it unfair to pass it by as if it had no part in the development of our manufacturing interests or in the decline of American shipping.

At the same time, it were equally unjust to disregard the effect of the removal of the discriminating duty of 10 per cent. in its effect upon that same shipping. This act should certainly direct trade via England—which naturally becomes the warehouse in such articles as jute—instead of promoting direct transportation from the country of production to the United States. With the advantage in favor of the English merchant there should then be a tendency toward concentration of control in his hands. The consumer must be the last under any such circumstances to reap a benefit from it.

The only interest which I can imagine as desirous of retaining the tax on jute butts is that of wood pulp, a fiber or preparation of fiber which is now in somewhat extensive use in the cheapening and adulteration of our various sorts of wrapping-paper.

The verdict of all manufacturers whose opinions I have heard expressed is undoubted that the best manila paper is made, as it is termed, "all jute." But even supposing it were not so, there appears to be no good reason why a check, in the form of a tax, should be put to the shipping interests of the country, or why the Calcutta and Indian trade and those interested therein should be handicapped for the benefit of and to favor the destroyers of our native forests.

It may be mentioned as one of the anomalies of our present tariff that rejected jute or jute rejections are allowed to enter our customs within the class of jute butts. When such rejections are no better than to serve the uses of butts, it seems unreasonable to find fault with the fact. But it happens at times that the quality is sufficiently good to perplex the appraiser and leave him at a loss to determine the proper duty. The amount at risk to the revenue is very small; but the fact points a moral in respect of a complex tariff.

A difference of $\frac{1}{4}$ cent per pound, which is about the duty, makes a decided difference in the consumption of so low-priced an article as jute butts. The same difference of price in the raw material more than doubles in the cost of manufacture of one yard of $1\frac{1}{4}$ -pound bagging used to cover our bales of cotton.

Hemp (fiber manila).—The foregoing argument in respect of jute fibers and so far as it refers to the development of our shipping and manufacturing interests through the relief of the present taxation on the raw material applies even more strongly to the article called hemp. I say "called hemp" because the manila fiber, which is so termed, is the cleaned fiber of a palm tree, and is a totally different natural product from the real *hemp* of Russian and American growth. The uses even of the real hemp and the manila hemp are quite different. Manila hemp does not take kindly to tar, while the fiber of the Russian and American growth does; and the result is in cordage that all tarred rigging must be of real hemp, while the hawsers and running rigging are made of the manila article.

There is no need of protection to American hemp by means of the tariff, for the simple reason that their character and qualities and uses are so divergent, and that the increase of duty on manila hemp or the removal of it altogether cannot, for some years at least, materially decrease or increase the quantity of manila hemp imported into the United States.

There seems to be a use for all manila hemp which can now be reasonably secured for our country, and our present consumption exceeds that of Great Britain and all the rest of the receivers put together. And one may add that the world's consumption during the last year (1881) and this (1882) would seem to exceed the total production of the Philippine Islands. The result is an enhanced value, so that the price now ruling is 100 per cent. above the price of four years ago, and as high as at any time in twenty years (excepting 1870 and 1872). This condition of the business has eventuated despite the tariff and despite its injustice in admitting sisal hemp at \$10 per ton less duty.

Sisal hemp or grass (so called) is the fiber of agave or aloe of Mexico and Central America, and can be so manufactured as an adulterant with manila fiber as to deceive even the most experienced. Its fiber is somewhat shorter than manila, and rather harder and harsher, but it is sufficiently strong for use in domestic cordage where there is but little exposure to weather.

Manila hemp consumption:

1862-'66, five years	bales..	131,000
1867-'71, five years.....	do...	140,000
1872-'76, five years.....	do...	140,000
1876-'81, five years.....	do...	165,000
1877	do...	146,715
1878	do...	127,394
1879	do...	153,173
1880	do...	176,600
1881	do...	220,685

Sisal hemp consumption:

1872-'74, three years.....	bales..	25,000
1875-'77, three years.....	do...	41,000
1878-'80, three years.....	do...	63,000 and increasing weight.
1881, one year	do...	104,633 and increasing weight.

From the above tables it will appear that the import of manila hemp (with its tax of \$25 per ton), although demanded for many uses, has not even doubled in twenty years, while the import of sisal hemp (favored by a lesser duty, \$15 per ton) has more than quadrupled in one-half of the time.

These two articles serve practically the same purpose. In fact it has often become a matter of doubt to the dealer in rope whether, when selling manila rope, he is really selling manila fiber, or sisal, or both. And

so, if it seems necessary to tax these raw fibers it is not an unnatural question to ask why both should not be placed upon the same basis, or, perhaps, rather, why the manila fiber should not be relieved of the extra \$10 per ton of duty.

But why a tax on either article will seem a question of more significant pertinence when the new use is shown which especially calls for the present large increase in the import of both fibers.

Whereas in 1879 the importation of manila hemp was 153,173 bales, the import of 1881 was 220,685 bales; and while the selling price in the former year averaged about 7 cents, in the latter year the average was nearly 11 cents. This important increase of import and value is due, I think, almost wholly to the new and large demand for binder's twine, with which it is now the custom to bind up the sheaves of grain throughout the West. Manila hemp by itself serves the purpose perfectly; but the article is costly. Sisal hemp by itself cannot, by reason of its harshness and hardness and shorter fiber, be accommodated to the machinery now in use. As an adulterant, however, or mixer with the manila fiber, the sisal has been successfully introduced into binder's twine to the extent certainly of 50 per cent.

But the duty on manila hemp, say on the average of five years past, or 165,000 bales at \$3 per bale, 270 pounds per bale, is \$500,000, and the duty on sisal hemp, say on the average of 1881, or 100,000 bales, at \$3 per bale of 400 pounds, is about \$300,000, making a total of relief to the consumer of rope, cordage, and binder's twine of \$800,000, when our tariff reformers see fit to remove the burden of its taxation. Like the duty on the cheaper fiber of jute and jute butts, the expense of collection of the hemp duty is large in proportion to the amount collected. It falls ultimately and with more or less burden upon the consumer, and helps again to enhance the cost of labor. It represents an extra outlay of capital, to be rendered account for by custom-house and Treasury, on the part of importer and manufacturing interest, and its relief must serve to advantage the consumer and labor, which is dependent upon the development and prosperity of our manufactures, and cannot, so far as I am aware, disadvantage any vested interest.

The importance of free hemp to our shipping interest cannot be easily estimated. The cost of rigging and cordage is a noteworthy part in the cost of a ship's equipment, and that cost can be reduced by a marked percentage by the removal of the present duty on the raw fiber. No matter if one dare or dare not prophesy the continuance or betterment of our Navy, or the revival of the American merchant marine, the thought must come that Congress can afford relief and assistance in the ship's hempen equipment more easily, perhaps, than in any other part of the structure.

JOHN H. TINGUE.

NEW YORK, *October 3, 1882.*

Mr. JOHN H. TINGUE, of the Tingue Manufacturing Company, made an argument in the interest of the manufacturers of mohair goods, and for encouragement of the raising of Angora goats. He said:

In relation to our industry, we are, at the present time, obliged to import the raw material. We ask for a strong tariff on mohair pile fabric, and that the duty on mohair shall remain as it is.

By Commissioner OLIVER:

Question. You want the present duty maintained on the raw material?—Answer. I think it wise to do so. We are paying wool duty on mohair, and if the duty be taken off wool it should be taken off mohair. But if you do, see how the Western farmers, who raise wool, will go down. I believe in a protective tariff on everything.

Q. You speak in general terms of a high rate on mohair fabrics. What are mohair fabrics?—A. The mohair comes from the Angora goat. We are paying 12 cents a pound and 10 per cent. ad valorem on the material, which we are importing from Bradford, England. I should say, let it remain as it is, not for my own interest, but for the interest of the country at large, and in order to encourage the raising of the Angora goat in this country.

Q. You have some recommendation to make as to the manufactured article?—A. I should say, leave it as it is.

Q. What are the rates now?—A. I cannot answer positively; but I should say they can be landed at about 100 per cent.

Q. How extensively is mohair manufactured in this country?—A. It is used in this country for making alpacas and brilliantines; but the disuse of these fabrics has caused the decline of mohair manufactures in this country. In Bradford, England, in 1872, mohair was commanding a large price on account of the making of alpacas and brilliantines. This pile fabric for furniture covering was never made in this country till we made it.

Q. You are the pioneers of the manufacture of this class of goods in this country?—A. Yes.

Q. How long have you been in the business?—A. We made the first yard in October, 1881. We had been working at it two years before we made the first yard.

Q. What has been the production since that time?—A. We are increasing our product. We are making 500 yards a day of mohair plush, for the covering of seats, &c., of railroad cars, and we are increasing our production.

Q. You think you can make a commercial success with the present tariff?—A. Yes.

Q. You say that about 100 per cent. is the rate?—A. If it costs 2s. a yard in England, then, with duty and insurance, &c., it costs 4s. to land it here.

Q. Do you not think you could get along with a less rate than that?—A. Yes, if we could have labor at 20 cents a day.

Q. The question is whether, with the present conditions, you cannot maintain your manufacture at less than the present rate of duty, which

you say amounts to about 100 per cent.—A. Not with the mohair, which we are obliged to import. We are depending on the foreign wool, which comes from Asia Minor and South Africa, by way of Liverpool.

Q. Taking the present condition of things—what you have now to pay for mohair and for wages—and assuming that this condition of things is to continue, can you not get along at a less rate of duty?—A. Possibly we could, if we could get the mohair at the present price.

Q. What are you paying for it now?—A. We are importing it at about 66 cents per pound. That is the average rate. But the market on the other side is advancing. We received yesterday a letter from London mentioning an advance there. What I should ask is to encourage the growth of Angora-wool in this country.

Q. Are there any flocks of Angora goats in this country?—A. Yes; there is one flock in Connecticut, owned by the president of the agricultural society. Mr. Peters, at Atlanta, Ga., has another flock. Then there are flocks in Texas, Wyoming, and California. They have about 30,000 Angora goats. Mr. C. T. Bailey, of San José, Cal., has a herd of 5,000 near the line of the Central Pacific Railroad. H. W. Hawk, of San Antonio, Tex., has a flock; and Dr. McIlhenny, surgeon in the United States Army, has a flock in Wyoming. The first Angora goat imported to this country was imported by a man named Scott, of South Carolina, who was minister to Turkey in 1848.

Q. Do you know the extent of the production of Angora wool in this country?—A. I do not. Mr. Robert Scott, of Frankfort, Ky., has also imported some thoroughbreds. It is an industry which is just as staple as the wool industry. The question is about the tariff on mohair goods. If you take the duty off we must stop.

By Commissioner GARLAND:

Q. Do you know the number of Angora goats in this country?—A. I do not. The president of this Commission has made a study of the subject, and has recently written a book about it.

Q. How much hair of the Angora goat are you consuming?—A. About 5,000 pounds a week.

Q. What proportion of that is raised in this country?—A. Not one-tenth.

Q. Do you require the fleeces of thoroughbred animals?—A. Yes; we use the long fiber of thoroughbreds. We are not using the short fiber, but we sell it to other parties.

Q. Is it not a fact that the animals who are graded up to three-fourths or seven-eighths have long fiber?—A. Yes.

Q. Can you not use that?—A. Yes; we use anything over 4 inches long.

Q. What proportion of thoroughbred blood is required to give the fleece the length of 4 inches?—A. People who have made a study of the common goat think that about four crosses produce a very nice Angora goat.

Q. Where do you buy your fleeces?—A. We are importing through Bradford, England.

Q. What is the average price at Bradford?—A. It is costing us now about 66 cents a pound after paying the duty. The price at Bradford is 22½d. It pays 12 cents a pound and 10 per cent. ad valorem.

Q. You ask no change in the duty on the fleece?—A. I should say not. It is paying the same duty as wool. It is claimed that it is wool. When I was in the importing business in New York and we were importing alpacas and brilliantines, we made a claim that it was hair. We

paid all the duties under protest, but the government decided against us, holding that it was wool, and we are paying wool duty to-day on mohair.

Q. What is your recommendation in regard to mohair goods? Do you recommend a change in the present duty?—A. I should say not.

Q. Does your observation lead you to believe that, with a continuance of the present duty, you could depend on this country eventually for your supply of wool?—A. It does.

Q. What has been the increase of fleece within the last ten years?—A. The decline in alpacas and brilliantines made a decline in the amount of mohair material consumed. People who had herds of Angora goats were discouraged; but now, in making this mohair pile fabric, we are encouraging the growth of the Angora goat mostly in the West—Wyoming, Oregon, Colorado, Texas, and California. It seems to me that, in order to encourage that industry, the duty should be kept where it is.

Q. Do you know of any movement to reduce the duty?—A. I do not.

Q. What is the average shearing of these goats?—A. From 5 to 7 pounds.

Q. What shrinkage is there in the wool?—A. It depends upon the sheep. We had some from Mr. Peters, of Atlanta, Ga., which did not shrink 15 per cent. in the washing. We have had fleeces sent to us from Texas and the Southern States, unwashed with some burrs in them. I cannot give you the exact thing, but I should say that where the wool was properly washed there is about 25 per cent. of "moils" in that of thoroughbreds.

Q. What do you do with that?—A. We are not using it, we sell it. It goes into the manufacture of rugs and robes.

Q. Then it is not a loss?—A. Not at all; but we have got to sell it at one-fourth the price of the fleece.

Q. What do you pay for the fleece of the Angora?—A. On the average 50 cents a pound.

Q. How does it compare in quality with the foreign fleece?—A. The foreign fleece is sorted on the other side. It costs us 66 cents.

Q. You pay 50 cents for the American fleece and 66 cents for the foreign, and you account for the difference by the fact that it is sorted on the other side, and that you have not so much waste to pay for?—A. Yes. We paid Mr. Peters 70 cents for some of his. We would rather get our mohair in this country if possible. It is a standard article like wool; while some fabrics may be made of itself alone, it is generally used in connection with some other material. Take the lining of my coat; the filling of it is mohair. I do not know where it is made, whether abroad or here. The mohair in the binding comes from the Angora goat. I believe that the Angora goat should be protected, and the duty left as it is.

By Commissioner McMAHON:

Q. Have you stated the foreign price per pound of the long staple?—A. The last that we got was 22½ pence; but we cannot get any more at less than 2s.

Q. Then it is about 50 cents a pound on the other side?—A. Yes.

Q. And the duty of 12 cents a pound and 10 per cent. ad valorem is equal to 17 cents a pound, or about 34 per cent. Does that include commissions and charges?—A. No. We pay 2½d. commission on the other side.

Q. The duty on the manufactured article, you say, is about 100 per cent?—A. Yes.

Q. Do you think that a fair relative proportion? What proportion of the cost of the finished product is in the actual manual labor?—A. I should say about one-third.

Q. What is the difference in the rates of wages here and abroad in your business?—A. We are paying to-day about three times as much as they are paying in Germany or Saxony.

Q. Then your proposition is that, while the wool of the Angora goat is protected by 34 per cent., and while the difference between wages here and abroad is about 22 per cent., you recommend a protection of 100 per cent. on the finished product?—A. We cannot much more than compete with the foreign product under the present tariff, and make a fair profit. The people on the other side have had years of experience and have got things down very fine. If the duty were reduced we had better close.

Q. Does your machinery cost you more here than it costs abroad?—A. We are obliged to get foreign machinery and to pay the duty on it. It is mostly made in Bradford, Yorkshire.

By Commissioner UNDERWOOD:

Q. The duty at present is compound. Is there any particular reason why a compound duty should be retained instead of a specific duty?—A. It seems to be that, with a specific duty, there would be less complication about it.

By Commissioner OLIVER:

Q. You say that yours is the only mohair manufacturing concern in this country?—A. Yes.

Q. What does your product go into?—A. The seats of railroad cars, sofas, &c.

Q. What is the amount of your annual production?—A. About 500 yards a day.

Q. What is the average price?—A. About \$1.50 a yard.

WILLIAM P. COPELAND.

NEW YORK, *October 3, 1882.*

Mr. WILLIAM P. COPELAND, of Washington, D. C., attorney for M. Cohn, of New York, corset manufacturer, made an argument in favor of taxing horn strips for corsets. He presented bundles of the article, and said that common sense showed that it was an imitation of whalebone. He said:

This article is used in the making of corsets. It is made from the ibex horn. It is imported now as "horn strips." Horn strips are generally supposed to be made into glæ, or to be "glue stock" generally. These, you can see, are manufactured articles of horn, and should pay 35 per cent. ad valorem. Instead of being known in the trade as manufactures of horn, or as horn strips, they are known as horn whalebone.

By Commissioner OLIVER:

Question. What is your point?—Answer. That this article is now (under a decision of the Treasury) on the free list, instead of paying 35 per cent. ad valorem as a manufacture of horn.

Q. What do you recommend?—A. I leave that to the judgment of the Commission. I represent the largest manufacturer of corsets in the United States. He has spent \$50,000 in trying to get American machinery for the purpose of making these horn strips, which are now only made in France. He had to give it up, however, and to close his place when the Treasury made its decision allowing horn strips to come in free.

By Commissioner AMBLER:

Q. Then the trouble is an arbitrary decision of the Treasury Department?—A. Yes, sir.

Q. Your judgment is that the custom-house officers decided right in requiring these horn strips to pay a duty of 35 per cent. as a manufacture of horn, and that the Treasury was wrong in putting them on the free list?—A. Yes, sir. I think also that a specific duty should be fixed on them.

By Commissioner GARLAND:

Q. What are horn strips?—A. We say that they are manufactures of horn. They are known commercially as "horn whalebone," and are used in the manufacture of corsets.

Q. Do you understand that this is a manufacture of this country?—A. Yes.

Q. Where do you get the material?—A. Entirely from India. Sometimes, on account of the 10 per cent. discriminating duty, we have got it through the West Indies.

Q. Is there any duty on the raw material?—A. No; but we claim that this article is dutiable at 35 per cent.

Q. The Treasury Department overruled you?—A. Yes; but not wisely. I think that the judgment of the New York custom-house officers was against the decision of the Treasury Department. All that we ask is that the words "horn strips" be struck out of the tariff law.

By Commissioner McMAHON:

Q. All horns are admitted free by law?—A. Yes.

Q. And I understand your claim to be that, when the horn pith is extracted and the shell of the horn is split, these pieces of split horn shell are what is commercially known as horn strips?—A. No, sir. Every one of these pieces has to be made from a horn that is soaked two or three months in water. Not over 40 per cent of the horn is valuable.

Q. The raw horn is first soaked, and the pith extracted; then it is split, and the split pieces are what is held by the custom-house to be what is known in commerce as "horn splits." Then the Treasury Department decided (and it is that which you object to) on the 18th of September, 1872, that horn strips used in the manufacture of corsets are the "horn strips" of commerce, and are exempt from duty. Your argument is that these are not the "horn strips" of commerce?—A. Yes. This sample [exhibiting it] is marked "Bombay horn strips"; that is to evade the law. This other sample [exhibiting] is French made.

Q. Would not your object be accomplished by a definition in the law of what is "horn strips"?—A. Yes; by the definition that it is "glue stock." Every one knows that this [showing sample] is a manufacture of horn.

By Commissioner GARLAND:

Q. What you understand by "horn strips" is the shell from the horn?—A. The waste of the horn. The machine for cutting or slitting could not be made for less than \$5,000.

Q. What do you consider as "horn strips"?—A. Anything but manufactures of horn. Any strip from the horn.

GEORGE W. DEAN.

NEW YORK, *October 3, 1882.*

MR. GEORGE W. DEAN, of New York, addressed the Commission as follows:

GENTLEMEN OF THE TARIFF COMMISSION: I am not here to represent any particular American interest, but to give my views on the defects of the present tariff system, and the remedy therefor, by a new amendment or section added to our tariff laws for self-adjusting duties, to prevent a continued yearly adverse balance of trade with other nations, and its disastrous effects upon our country, as in former times.

Having given from my youth a great deal of time and thought to the very important subject of our tariff laws, being the laws having a direct bearing upon our whole country's prosperity, and being a subject of paramount importance to every American business, farmer, trade, or industry, and to wages of workingmen, which interests so many for good or evil; and as the country looks to your Commission for judicious recommendations in relation to the defects in our present tariff, I take the liberty to recommend to your Commission a new amendment or section to be added to our tariff laws, to remedy what I have deemed for many years a vital defect in said laws, and it would be, in my opinion, greatly to our country's advantage to adopt the same; which new section, in my judgment, would be a perfect preventive against a continued yearly adverse balance of trade to our country (as in former times), and of great panics, affecting all business, such as occurred in years 1837, 1857, 1873, with the succeeding years of depression to employments and wages, and the suspension of specie payments. Statistics of our trade imports and exports (if referred to) will prove foreign competition and overimportation to be the true and only cause of all our former panics, being disastrously large and in excess of our exports, with a loss to our country in both gold and labor, employments amounting to many hundred millions of dollars for imports in competition with our own kind of products, for the years just preceding each and every panic, which our exports of merchandise could not liquidate and balance, as would have been done if our imports had been in value curtailed to that of our exports by defensive duties in amount to equal the real difference of foreign and American wages, which would have increased American productions and made our country the creditor in place of the debtor nation, being made thus by excess of imports alone.

In other words, by the tariff our liabilities for merchandise imports were allowed to largely exceed our assets for merchandise exports, which is sufficient evidence that our country was unnecessarily and disastrously running in debt by buying more from other nations than they bought of us, or was good for our labor employments or financial interests. For ours is not an old-established and wealthy country like that of England, living partly upon its money investments abroad, and on other nations by its vast ocean shipping interests and carrying trade.

One nation doing business with other nations is, by its follies and extravagance, subject to the same law of panic and failure from adverse trade as are separate individuals in trade; and our nation, to have its own States and people thrive, must be encouraged by its own revenue tariff laws to patronize its own country's productions in preference to

all others, that we may in turn be employed, prosperous, and self-sustaining, to that extent at least of preventing ours from becoming the debtor people and nation by an unfavorable adverse balance of trade with other nations, as in the years just preceding our panic times; and by so doing would save and economize to our country in the total foreign cost for imports of a kind we produce to sell, adding by this means to our total wealth in productions and to our people's prosperity, in which, be it remembered, we directly or indirectly share more or less, in whatever business, vocation, or part of the country we may live, as we all do share more or less in the suffering from adverse business times.

A judicious tariff, in my opinion, should be a self-adjusting one, and contain an element within itself to immediately check at the end of any fiscal year an adverse balance of trade without waiting, as we did under the old tariff system, for a panic, suspension of specie payments, and depression of business and wages to come upon us, and then, for the want of a remedy at hand, take years to cure by a starvation and bankrupt process.

The remedy I offer (or one to the same effect) is in the following section, and should be embodied in our tariff laws, viz:

SECTION —. *And be it further enacted,* That at the termination of any fiscal year that the total imports of merchandise shall for the year amount in value to over five-sixths of the total value of our country's merchandise exports for the same year (not counting or including money or gold and silver bullion as an export or import), then the Secretary of the United States Treasury is empowered and duly authorized and directed by Congress to immediately increase the duties one-sixth in amount upon all present dutiable imports, Congress retaining the right to reduce or increase all or any of the duties so increased by said Secretary at any time.

NOTE.—The difference of one-sixth allowed in merchandise in our favor is not equivalent to our losses to foreign nations for our ocean-carrying trade; American interest-bearing obligations held in Europe, and the loss to our country by expenses of American tourists abroad, being together estimated at over \$200,000,000 in gold per annum.

Then the question of the rate of duties upon imports will be decided alone, and fairly, by the total relative value of imports and exports, and by the balance of trade with nations; and, better yet, be removed from the prejudices of partisans and politics, placing, as it would, our country's prosperity upon a permanent, self-sustaining basis, by a continued favorable balance of trade, which should be paramount to all other single interests, either American or foreign.

The following are the official statistics of imports and exports and losses for the year and preceding years to each panic which occurred in years 1837, 1857, 1873, showing each year's loss to our industries and wealth by adverse balance of trade, and being the only true and sufficient cause for our country's former impoverishment and panics:

Year.	Bought, merchandise imports.	Sold, merchandise exports.	Adverse bal- ance of trade.
1831	\$82, 808, 110	\$59, 218, 583	\$23, 589, 527
1832	75, 327, 688	61, 720, 529	13, 607, 159
1833	83, 470, 067	69, 950, 859	13, 519, 201
1834	80, 973, 147	80, 623, 662	6, 349, 485
1835	122, 007, 974	100, 450, 481	21, 548, 493
1836	158, 811, 302	100, 570, 942	52, 240, 450
1837	113, 310, 571	94, 280, 895	19, 027, 676
Panic of 1837, caused by seven years of adverse balance of trade, total loss			149, 676, 991

Year.	Bought, merchandize imports.	Sold, merchandize exports.	Adverse balance of trade.
1850	\$104, 034, 033	\$134, 000, 233	\$20, 133, 800
1851	200, 476, 308	178, 020, 138	21, 856, 170
1852	195, 987, 314	154, 931, 147	40, 456, 107
1853	250, 157, 145	189, 800, 102	60, 287, 983
1854	275, 001, 770	215, 328, 200	60, 003, 570
1855	231, 650, 340	102, 751, 135	38, 899, 205
1856	295, 650, 038	200, 438, 051	29, 212, 887
1857	333, 511, 205	278, 906, 713	54, 604, 582
Panic of 1857, caused by eight years of adverse balance of trade, total loss			335, 013, 573
1864	301, 113, 322	143, 504, 027	157, 609, 295
1865	209, 050, 525	136, 040, 248	72, 716, 277
1866	423, 470, 046	337, 518, 102	85, 952, 544
1867	381, 043, 768	279, 780, 809	101, 250, 959
1868	344, 873, 441	269, 350, 900	75, 483, 541
1869	406, 555, 370	275, 160, 693	131, 388, 682
1870	410, 803, 113	376, 010, 473	43, 186, 040
1871	505, 802, 414	428, 308, 008	77, 403, 506
1872	610, 904, 022	428, 487, 131	182, 417, 401
1873	624, 680, 727	505, 033, 430	119, 656, 288
Panic of 1873, caused by ten years of adverse balance of trade, total loss			1, 047, 070, 223

I further recommend, believing it wise and judicious, a change in the valuations of imports from foreign to home valuation upon all imports of a kind which we produce to sell. In our country's earlier days, we then not being a manufacturing country, foreign valuations were necessary, but this necessity no longer exists and should be changed, being now more convenient to ascertain the true value at home than the true one abroad for merchandise in competition with home productions, it will tend greatly to correct the growing evil of foreign undervaluations, which undervaluations are directly acts of smuggling of part of the imports, and practically annulling our tariff laws by defrauding our government of its just revenues.

As to the fruits of protection, and of a revenue free-trade tariff, the former makes our country a prosperous business nation and a creditor one, the latter a failing and debtor one. Protection increases the total wealth and value of our country's production. Revenue free-trade tariff reduces it. Protection is at the expense of foreign industries, by their loss of the American market. Revenue free-trade tariff is at the expense of American industries, they being wrongfully deprived of their own market. Protection will establish industries South and West to their advantage. Revenue free-trade tariff will prevent them. Protection destroys foreign monopoly of our market. Revenue free-trade tariff protects it. Protection builds silk, woolen, cotton, and other factories. Revenue free-trade tariff, like an incendiary, destroys them. Protection economizes imports and saves in the cost for them, which is equivalent to an increase of our exports. Revenue free-trade tariff increases imports and the foreign cost, which is equivalent to a reduction of our exports. Protection opens new mines and in new localities, builds foundries, rolling-mills, machine shops, and gives employment and good wages to thousands. Revenue free-trade tariff discharges them; puts out the fires in the furnaces, silences the anvils and trip hammers, stops the busy whirling wheels, the spindles, and drives hundreds of thousands of honest, industrious employes to idleness and want, and some to suicide and crime. Protection creates a demand for labor, and enhances wages. Revenue free-trade tariff destroys both.

Protection compels gold to flow into our country, to our advantage. Revenue free-trade tariff to flow out, to our ruin.

This country can always have a large business balance of trade in its favor if Congress chooses to give to our own industries their own home market, being a question of labor only, which our tariff wholly controls by duties on imports.

I hold that no tariff is a protective one that does not protect the whole country's business from an adverse balance of trade. The so-called protective tariffs may protect one special interest, or more, but does it protect the whole country's interests from becoming the debtor nation? If not, then it is not a protective tariff, but one that leads our country to panics and bankruptcy, as in former times. Prosperity to the whole country's business should be paramount to either the importers' or foreign manufacturers' business, or any other single unproductive interest of our country.

R. H. WOLFE.

NEW YORK, *October 3, 1882.*

Mr. R. H. WOLFE, of New York, representing wire and spring manufacturers, made an argument against any advance in the duty on wire rods. He said:

I appear here in the interest of twenty-five manufacturers of fence wire—a majority of the business. They are opposed to an increase of the duty on steel-wire rods, which is at present 30 per cent. They desire, if possible, to have the duty reduced, so that the farmers throughout the country may derive the benefit of the cheapness of the wire. I suppose that the fence-wire manufacturers consume more Bessemer steel to-day (outside of the steel-rail business) than any other steel industry in the United States. They also desire to have the duty on Bessemer steel in the crude state reduced. Also to have the specific duty abolished and ad valorem duties substituted, especially on Bessemer steel in the crude state.

Mr. Wolfe then read the following communication:

CHICAGO, *August 30, 1882.*

To R. H. WOLFE, Esq.:

We, the undersigned, barbed-wire manufacturers, do hereby request you to appear before the Tariff Commission and give your views on our behalf and in our interest, in relation to the tariff on iron, steel, &c., which views are opposed to any advance in the tariff on wire rods.

STILES & CALKINS, Chicago, Ill.
 SUPERIOR BARBED WIRE COMPANY, De Kalb, Ill.
 INDIANA WIRE FENCE COMPANY, Crawfordsville, Ind.
 IOWA BARB STEEL WIRE COMPANY, by R. E. Sears, president, Marshalltown, Iowa.
 LAMBERT, BISHOP COMPANY, Joliet.
 STONE CITY FENCE COMPANY, Joliet.
 LOCK-STITCH FENCE COMPANY, Joliet.
 A. N. KLEINFELTER & Co.
 W. W. B. WINN COMPANY, by W. M. Dillon, Sterling, Ill.
 W. J. ADAM, Joliet, Ill.
 AYRES & DECKER MANUFACTURING COMPANY, Bushnell, Ill.

 FRENTERS BARB WIRE FENCE COMPANY, East Dubuque.
 MISSOURI WIRE FENCE COMPANY, Saint Louis, Mo.
 SHUMAN & MARSH, Chicago.
 CLEVELAND BARB FENCE COMPANY, by M. Converse, president, Cleveland, Ohio.
 FISK & CARMELL, Joliet, Ill.
 OMAHA BARB WIRE COMPANY, Omaha, Nebr.
 SCHNABEL & Co., Chicago, Ill.
 NOVELTY MANUFACTURING COMPANY, Sterling, Ill., A. A. Terrell, secretary.
 CINCINNATI BARB WIRE FENCE COMPANY, James Lannon, president, Cincinnati, Ohio.
 THE THORN WIRE HEDGE COMPANY, Chicago, by A. S. White, president.
 H. B. SCUTT & Co., Joliet, Ill.
 H. B. SCUTT & Co., Buffalo, N. Y.
 THE HAZARD MANUFACTURING COMPANY, New York and Wilkes-Barre, Pa.

By Commissioner GARLAND:

Question. Do you manufacture barbed wire?—Answer. No. We manufacture plain wire and springs. But I represent twenty-five firms that do make barbed wire.

By Commissioner MCMAHON:

Q. I understand you to advocate the admission free of duty of raw material?—A. Yes.

Q. What is your definition of raw material?—A. I confine it (in my line particularly) to ore, and perhaps coal. I want to have a moderate duty on pig iron, Bessemer steel in ingots, blooms, &c.

Q. You would have a progressive duty according to the assumed proportion of labor. Is that the idea?—A. Yes.

Q. Is not ore almost entirely the product of labor?—A. I suppose that most of the cost of the ore is in labor.

By Mr. OLIVER:

Q. What is the price of steel rails to-day at the mills in England or Germany?—A. I suppose that they can be bought to-day at the mills, free on board, at about \$25.

Q. What is the price to-day at the steel works in this country of what is known as Bessemer pig iron—good No. 1 Bessemer pig iron?—A. From \$23 to \$25.

Q. Then the price of Bessemer pig iron in this country is about \$25, and the price abroad is about \$25?—A. Yes.

Q. Then it is very difficult to make rails at a profit in this country?—A. But they use only a very small proportion of the best iron. They use a majority of pig iron, which probably does not cost more than \$14 or \$15. It would be hard to prove what the manufacture of steel rails costs, because most of the steel works own their own mines and make their own pig iron.

WILLIAM D. MARVEL.

NEW YORK, *October 3, 1882.*

Mr. WILLIAM D. MARVEL, of New York, importer, addressed the Commission as follows:

Mr. PRESIDENT AND GENTLEMEN OF THE COMMISSION: The points upon which I wish to speak are the *unconstitutionality of the system of protection*, and the inconsistencies and incongruities of our present tariff, giving practical illustrations of the evils growing out of the powers of Treasury officials to make what are called "decisions," and the avenues opened for dishonest practices in entries and reappraisements. I wish also to suggest means for simplifying the tariff, by introducing all fundamental raw material free of duty, enacting a fair competitive revenue tariff on manufactures, and adding to our system of taxation *direct taxes* as required by the Constitution, and the proportions which each tax might contribute to our requirements.

Nowhere in the Constitution is it allowed to lay protective duties or prohibitive duties upon any article in commerce, or of the wants of man; and nowhere in the Constitution is it allowed to make any privilege or class legislation. That would be directly contrary to the very spirit under which the Constitution was framed.

And yet what do we experience to-day? We experience one of the most supremely privileged class-legislated countries on the face of the earth.

When England was suffering under corn laws, wool laws, excises, and all the privileged class legislation of former times, mark the result! Riots and bloodshed from one end of that country to the other. We read of people compelled to bury their dead in woolen shrouds; and if any person dared export any sheep, lamb, or ram, for the first offense to forfeit all his goods forever; suffer a year's imprisonment, then have his left hand cut off, in a market town upon a market day, to be there nailed up; and for the second offense to be adjudged a felon, and suffer death accordingly.

This was protection to the woolen trade. The dead must be buried in woolen shrouds, and if any person committed the second offense, as described, he must die as a felon, and thus furnish one early customer for the protected woolen trade.

The object of such laws, and later laws, not so severe, however, as those just cited, was to give the woolen manufacturers "a monopoly of the woolen trade of the world." Even Fuller's earth or clay (upon which we assess a duty of \$3 per ton), necessary for the use of the woolen manufacturers, was forbidden to be exported, under nearly the same penalties. This is one kind of protection, as was given to the woolen manufacturers of England in former times. It differs somewhat in the manner of doing it, from our system of protection, but in the result there is not much difference.

The land owners and farmers—they too wanted protection, and they got it largely under the corn laws. And, ostensibly with the object of protecting the land owner and farmer, by giving them the full prices for consumption, it was enacted that whoever should buy any corn or grain with intent to sell again, should suffer two months' imprisonment and forfeit the value of the corn; for the second offense, six months'

imprisonment and forfeit double the value; and for the third offense, sent to the pillory, suffer imprisonment during the king's pleasure, and forfeit all his goods and chattels.

In these old laws, with all their apparent severity, there is one thing which presents itself to our admiration, *i. e.*, the protection that was meted out alike to the manufacturer and to the farmer; and, unlike our system, where we protect the manufacturer and leave the farmer not only unprotected, but, by the injustice in our method of protecting the manufacturer, we actually tax the farmer by the additional price he must pay for such goods as he must consume for his family. In other words, we make the farmer compete with the world, and then legislate the reduction of the purchasing power of his earnings by 50 to 60 per cent.

Is this system, I ask, anywhere in accord with the spirit of our Constitution? I answer, no!

While we do not forbid the exportation of wool, or sheep, or lambs, or rams, nor forbid the exportation of corn, nor its being bought to sell again, we do forbid the importation of woolen goods except upon payment of exorbitant duties, thereby permitting the manufacturer to obtain a so much higher price for his goods from the farmer. These duties run from 40 to 102 $\frac{9}{10}$ per cent., as may be seen by reference to the "Commerce and Navigation Reports for 1881." So far as the needs of the people go into such goods the purchasing power of their money is thereby reduced in this direction by an average of 60 to 70 per cent.

Bring this down to your own personal expenditures. You may have incomes of \$5,000 or \$100,000 per annum. Consider by what means you may augment the purchasing power of the same and save to yourselves 60 or 70 per cent. of it. Upon your personal experience base your sense of duty to your countrymen, and adjust the tariff upon that common-sense basis, and nobody will have any cause to complain, unless they are of the privileged class under the system of protection. And such a class have no rights under our Constitution and our laws, except that their misdirected capital may not be sacrificed as a productive power in the national wealth.

As I have spoken of the woolen manufacturer in the light of one of a privileged class, I may pause here to mention that he, too, has injustices to complain of—as a manufacturer—notwithstanding he has been made an example for the foregoing illustration.

Wool is one of the great staples of commerce. It is as varying in quality as the climes in which the sheep are grown and as are the grades of sheep. The manufacturer requires to be able to select his grades of wool from whatever country it may be found best suited to his particular goods. But here he is prevented by enormous tariff duties. He must pay from 25 $\frac{1}{2}$ per cent. to 76.4 per cent. duty on his raw wool.

These duties on wool are not to be measured by the exact rate named in the tariff law, but you must account his expenses in going to London to select his wools—the additional freight and public-store expenses in getting it to this country, and interest of money to cover the time of all this delay.

Trade throughout the world, with rare exceptions, runs in triangles. Except between the larger commercial cities, direct trade, employing ships to and from, is the exception. Vessels in the course of the great trades of the world—on one of the sides of the triangle—come to our American ports, and most of such vessels come in ballast. Many of them come from the Cape of Good Hope, Australia, New Zealand, South America and other wool-growing countries; and but for our tariff on

wool, and the necessity of putting it in bonded warehouses, and incurring all the concomitant expenses, in case the wool is not for immediate consumption, such ships would bring wool to our markets.

You may see that our importations of wool for last year amounted to 66,000,000 pounds, of a total value, at the place of exportation, of \$12,000,000, upon which \$4,800,000 duty was collected here, which is just 40 per cent. What chance has an American woolen manufacturer got to compete in the markets of the world when he starts with a handicap of over 40 per cent. increased cost in his raw material?

You may also see that 29 American vessels of a total tonnage of 15,803 tons, and 28 foreign vessels of a total tonnage of 25,260 tons, arrived in our ports during the last year, 1881, and entered "in ballast" from the wool ports of Australasia and South America. Thus there was 42,063 tons of unutilized shipping which might have brought wool as an article of commerce to our markets.

Our imports of wool, in tons, was 29,018. Thus we have driven away a commerce from our ports, including freight, of over \$18,000,000 in this one item alone (besides taxing our own people nearly \$5,000,000, on raw wool), which is 13,045 tons more than our entire imports of raw wool. This system of figuring the follies of our tariff law, if carried into the multitude of other materials, would present an appalling array of figures. Nor has this system been of any benefit to our home products of wool. A single instance of the condition of the wool-growing interest in Iowa shows, viz: In 1867 the State of Iowa had over 1,300,000 head of sheep; in 1881 she only had a little over 400,000, showing a decrease of over 900,000 in 14 years. In 1867 Iowa had 89 or 90 woolen manufactures, and in 1881 she only had 40 or 41.

I could furnish figures of facts in other States quite as appalling as these, but this instance is quite sufficient to illustrate the results of our tariff system on the wool trade.

I believe had wool been duty free during the past ten years, that to-day we should have seen New York the wool market of the world, and American woolen manufacturers able to compete in any market of the world with their woolen goods. The same illustration may be made in regard to jute and other fibers, which, if admitted free of duty, would afford the basis for an enormous industry in manufacturing sacks for our cotton trade alone, besides all the various other uses to which the manufactures from jute, &c., are put in this country. This, then, illustrates the claim that is made upon your attention for enacting that all raw material entering into our manufactures of any kind shall be duty free. The claims upon which this enactment are asked are founded upon the most simple principles of mercantile success and upon common sense.

The raw material, to the manufacturer, is the foundation upon which his fabric is constructed. If you raise his cost of foundation, you increase the cost of his fabric in a pretty well defined ratio, and thereby not only place his goods out of the purchasing power of the greatest possible number of our countrymen, but place him absolutely out of any possible chance of selling his goods at all in any other country. Our present tariff laws, to the woolen manufacturer, are a delusion and a snare, as the history of the woolen trade in this country for the last twenty years will prove.

Raw material, however, in general, means the first article used in any line of manufacture, and as each stage of manufacture is producing something that may be used as raw material in the next succeeding stage of manufacture, each may be claiming its own particular "raw material" to be made *duty free*.

Here complications may arise to your perplexion, as in the ramifications of the iron trade you will have the iron smelters asking for ores duty free; you will have the foundrymen asking for pig iron duty free; and the foundryman will be joined by the hardware manufacturer, the puddler, and rail-maker to have pig iron duty free.

But you will also find the smelter, while asking for ores duty free, will ask for a good protective duty on pig iron. The foundryman, the hardware manufacturer, the puddler, and the rail-maker will impress upon your mind the propriety of making pig iron duty free, and giving them a large protective duty on castings, hardware, bars, and rails, respectively.

You may find one class of Western claimants who are largely interested in iron-ore mines and furnaces and Bessemer steel works combined, who have a most apparent sinister motive in coming before you to ask for a high duty to be placed on iron ore. Such motives are apparent to those who are familiar with the trade. For instance, certain Western manufacturers have some limited facilities for obtaining ores for their own use. In those ore mines they have in some cases invested money unwisely, both as regards the mines and as regards the amount paid for them. In other cases they have enormous profits from really good mines, which are capitalized at large sums of money, and the stocks of which, at a par value of \$25 per share, are selling at from \$200 to \$300 per share, or quoted at per centum from 800 to 1,200 per cent.

What is the cause of this? Simply this, that good ores are so very scarce that they are able to command such an enormous price from the furnaces that the profits on the ores are very large. One company of only \$500,000 capital pays dividends approximating 200 per cent. per annum. This industry evidently needs more "protection."

I have taken the following from the New York Evening Post of September 21, 1882:

[Special dispatch to the Evening Post.]

CHICAGO, September 21.

Business in the upper peninsular iron region was never so active as at present. The total lake shipments from the opening of lake navigation to September 19 were 2,155,637 tons against 1,609,373 tons for the same time in 1881. The mines are reported to be earning large dividends. One hundred thousand dollars was refused here for a one-sixteenth interest in the Quinnesec Mine that cost the owner \$15,000 six months ago.

These ore miners seek now to impose a duty upon ores which will be a heavy discrimination against the Eastern manufacturers, who must naturally look to foreign ores for a portion of their supply. If you impose a duty upon foreign ores you will handicap all Eastern manufacturers in competition with the Western. If you admit iron ore duty free, as you should all raw material, you will then leave the Eastern manufacturers only to the natural disadvantages of their location.

In this Bessemer steel process, to make pig iron suitable for conversion into Bessemer steel, as it is called, it is necessary to have ores of peculiar characteristics. With the enormous growth of this Bessemer industry, not only in this country but in Europe, the question of ores suitable for the purpose has become one of most vital importance, in view of the comparatively few ores that are found in the world which meet the requirements for this process.

In France, Germany, Belgium, and England, the large works have been acquiring large properties, and small ones, too, in Spain and Africa; and the importation of foreign ores into England alone last

year (1881) was nearly 3,000,000 tons. The other countries mentioned are importing proportionately. In this country last year such importations reached over 700,000 tons, and it is comparatively a new branch of business in this country.

I believe I am the pioneer in this business, and the first to introduce, for regular use, foreign ores in this country, some eight or nine years ago, since which time I have made regular importations. I think that I speak truthfully when I say that I am the only person in the United States who owns or controls any foreign iron ores, and if anybody that has a right to speak upon affairs in this country is entitled to have his opinions heeded, I claim that right and title upon this subject. I believe that the duty on iron ore should be free, and yet I will frankly say that, if the dishonest importers could be in any manner circumvented or compelled to make honest entries of their invoices, I would hold up both hands for a duty of 10 per cent. ad volorem.

In New Jersey, some time ago, a petition was circulated under the auspices of certain political aspirants who desired to curry favor in the iron-mining regions of New Jersey, making many wild and untruthful statements in relation to the importation of iron ores.

A copy of this petition was addressed to the Hon. Abram S. Hewitt, and Mr. Hewitt replied to this petition as follows:

NEW YORK, *December 30, 1881.*

DEAR SIR: I have received copies of the petition which the citizens of Morris County are requested to sign in favor of an increase of duty on iron ore.

The petition is based upon a total misconception of the facts of the case. If the miners regard their own interests they will petition for an entire abolition of the duty on iron ore, because every ton of foreign ore that is brought here enables a ton of our ore to be used which would otherwise find no market. The reason of this is that all the ore in Morris County contains a little more phosphorus than is possible to be used in the manufacture of steel. The foreign ores imported are practically free from phosphorus. By mixing the two in equal proportions a pig iron can be produced which is fit for the Bessemer converter.

Hence, the more foreign ores we can get the more American ore will be used, and the better price we shall be able to get for it, and the higher wages we shall be able to pay the miners.

I shall therefore do all in my power, although my firm is the largest miner of iron ore in New Jersey, to secure the total abolition of the duty, and not its increase.

You are at liberty to communicate my views to your neighbors and to the public in any way that you see fit.

Truly, yours,

ABRAM S. HEWITT.

Here you have the published testimony of one of the best known men in the country, whose firm, Cooper, Hewitt & Co., are, I believe, the largest owners of iron-ore property in New Jersey, telling his own preferences. The statements that Mr. Hewitt makes are practically correct, and the results to be obtained by foreign ores duty free are all that Mr. Hewitt says they will be, and all that Mr. Hewitt says of iron ore is equally applicable to all the raw materials of commerce in the results to be obtained in the other lines of manufactures.

The tariff law nowhere specifically provides for iron ore, although lead ore and copper ore and gold ore and silver ore are specifically provided for. The present tariff law is one mass of inconsistencies and incongruities. It lacks any consistency whatever with the spirit of our Constitution, or with the spirit of the age in which we live. It lacks any congruity whatever with regard to its classification of the various articles of commerce with which it is supposed or was intended to treat. Among "wool and woollen goods" you will find hemp and jute carpeting and oil-silk cloth. Among "earths and earthenwares" you will find

slate pencils and roofing slates. Among "metals" you will nowhere find iron ores mentioned at all, although you will find lead ore and copper ore; *but you may look in vain for tin*, and many of the manufactures of iron you may find scattered about under various classifications.

Thus under Schedule E, "Metals," you may find needles for knitting or sewing machines," and if you wish to find *needles for sewing*, you may find in schedule M (Sundries), "needles, sewing, darning, knitting, and all other descriptions not otherwise provided for." Ores of gold and silver you will find on the free list as free of duty. Thus, ores of lead, and ores of copper, and ores of gold, and ores of silver, are respectively provided for, but ores of iron are not provided for. These are all raw unmanufactured articles of commerce.

At the time the tariff law was framed the importation of iron ore was not thought of. But, when it happened to become an article of importation, there was no classification that covered it, except the section 2516, R. S., which provides for "all raw or unmanufactured articles, &c., 10 per cent. ad valorem." Importations were met with an uncertainty on the part of government officials. I was told the duty would be 10 per cent.; that was during the administration of President Arthur, then Gen. C. A. Arthur, collector of the port of New York; but, when I entered my cargo, I was told the duty would be 20 per cent. It had, meantime, been discovered that some few tons of ore had a few years before been introduced at Plattsburgh, New York State, for the purpose of a test, to see what sort of iron it would make, and solely for the purpose of determining its worth upon which to base calculations for erecting works in Canada for utilizing this ore near its natural location. Thus, the classification, for duty, of iron ore seems to have come up for the first time, as just related. This occurred in 1867, and it appears by the Treasury Department records that the collector of the port of Plattsburgh asked information from the Treasury Department as to what rate of duty should be charged upon iron ore, and received a recommendatory letter from the department as follows:

WASHINGTON, *September 25, 1867.*

SIR: Your letters of the 28th ult. and 13th inst. are received in relation to the rate of duty to be assessed on iron ore.

As at present advised, the department is of opinion that you had better assess duty thereon at 20 per cent. ad valorem under section 20 of the act of March 2, 1861, and should the party be dissatisfied with the rate of duty thereon imposed, he can pay the duty under protest and appeal to the department, when the question will be further considered and a decision rendered according to law and the facts as then presented.

HUGH McCULLOCH,
Secretary.

From this recommendatory letter (not a decision of the department) there seems to have been no appeal, probably owing to the fact that the importation was so small, and only for the purpose of an experiment, that it would not pay for the annoyance and waste of time. Iron ore has been thus assessed for duty to this time.

The act of March 2, 1861, section 20, as referred to by the Hon. Secretary McCulloch, says, "Mineral and bituminous substances in a crude state not otherwise provided for." To this clause (see Heyl's Digest, sec. 94) there is a reference to section 472 (Heyl's Digest), by reference to which it may be seen that the spirit and intent of that law was and is to apply to only such substances as are "mineral and bituminous," *per se*, and there may be found such "substances" as are "mineral and bituminous" specifically named, such as the "coal oils,"

“asphaltum,” “shale,” “petroleum,” “rock oil,” and other such “substances” as are “mineral and bituminous.” This law, therefore, only applies to such “substances” as are “mineral and bituminous substances,” that is, of mineral origin and of bituminous character, and in a crude state, and which does not in any manner apply to iron ore.

Iron ore is a metallic or metalliferous substance, nor is it exactly in its crude state, but it is a metalliferous substance, a raw material and an unmanufactured article, used for manufacturing iron. Iron ore is found in nature in metalliferous veins and masses, in various mineralogical eras. Le Conte says that “metalliferous veins are composed of two general kinds, viz, veinstuffs and ores.” Dr. Ure says that “the study of mineral substances called gangue or veinstones, which usually accompany the different ores, is indispensable in the investigation and working of mines.”

Dr. Ure also says, “Gangue is a word derived from the German gang—a vein or channel. It signifies the mineral substance which either incloses or usually accompanies any metallic ore.”

Davies, a well known English authority, says ore is the substance specially containing metal.

When mining for iron ore is carried on, it is necessary at times to break down more or less of the veinstones, gangue, or mineral substance forming the walls of the metalliferous veins, or mineral veins running through the metalliferous substance; but in such cases all the mineral substance is carefully sorted out and thrown away and only the metallic or metalliferous substance, the iron ore, is used. This is the fact, and iron ore is in fact a metalliferous substance, and known only as iron ore in the market, and is the “raw, unmanufactured article” of commerce used by the blast furnaces for making pig iron as its chief use.

The value of iron ore depends upon its purity in metallic or metalliferous substance or contents and its freedom from all mineral substance. Iron ore which possesses any considerable amount of mineral substance or any bituminous substance would be worthless.

A “substance,” says Worcester, “in its logical and metaphysical sense, is that nature of a thing which may be conceived to remain when every other nature is removed or abstracted from it.

Now what can be conceived to be the nature of the substance of iron ore? Simply metallic or metalliferous. There appears to be no ground for the classification of iron ore as a “mineral and bituminous substance in a crude state.” The substance of iron ore is metallic or metalliferous; it is always as free from mineral substance as it is possible to be, to attain its highest possible yield of metallic substance, upon which its value depends. It has no bituminous substance whatever, and therefore is not a “mineral and bituminous substance,” and it is never in a crude state, for the word “crude,” as applied to ores, means undressed, that is, unassorted. Iron ores are always carefully assorted at the mines, that they may not contain any mineral substance, either in separate pieces or in fragmentary pieces of the mineral substances which sometimes adhere to the ore as it is blasted out.

Thus this classification as a “mineral and bituminous substance in a crude state,” it would seem, is disposed of without a single thing to justify it. My own opinion is that iron ore should be classified under section 2516 as a raw or unmanufactured article and pay 10 per cent. ad valorem duty, although I have obtained the opinion of that distinguished authority, Professor Doremus, of New York, who says “that iron ore is oxide of iron, and should be admitted duty free under sec-

tion 2505, where colcothar, dry, or oxide of iron are classified duty free." Thus you have my opinion as founded upon what I think is the proper classification for iron ore, and you have the opinion of one of the most distinguished professors and experts in this country.

Regnault, one of the most eminent writers on chemistry, wrote that "the study of crystalline forms plays an eminent part in the classification of substances and in our modern chemical theories." Mark here, the subject of all this is substances.

There was a time when earth, air, fire, and water were supposed to be all the elements. Then earth was divided into the animal, vegetable, and mineral kingdoms. These have again been subdivided. Perhaps in the District of Columbia, in the Treasury Department, they have not abandoned the "Three Kingdom" theory. Yet the proceedings of Congress show that the Smithsonian Institution faculty have progressed so far beyond the "Three Kingdom" theory that when they ask Congress to make an appropriation for them they ask, as you may see by reference to the Forty-fourth Congress, Session II, Chapter 105, A. D. 1877, for an appropriation "to duplicate ores, minerals, and objects of natural history," which was granted by Congress accordingly. The Treasury Department classifies iron ore as a "mineral and bituminous substance in a crude state." Notice that here is a careful consideration, for the appropriation was to be for the specified purposes, and shows that ores are not considered minerals; and that it was necessary to specify ores and minerals separately and distinctly, which was perfectly right and proper to do. Also notice in the report of the United States Geologist, Professor Featherstonehaugh, as far back as 1835, in his geological report of an examination made in 1834 of the elevated country between the Missouri and Red Rivers, he refers to "incipient encouragement now (then) given to geology by some of the State governments," and cites the importance that the few individuals in the country possessing the requisite experience should not be overlooked, and that their labors are worthy of being transferred to geological maps upon which should be accurately laid down all the important mineral and metallic deposits. There is not an authority among modern writers who does not carefully distinguish between these substances—mineral and metallic.

Metallic substances are those having a metallic base, and ores of commerce are such metallic substances as may be used in commercial economy for smelting and producing their respective metals. Thus iron ore is that metallic substance, carefully assorted and freed from all mineral substances, and with no bituminous properties whatever, commercially known as iron ore, and used in commercial economy for smelting and producing the metal known as iron.

Mineral substances are divided in various ways according to their nature, viz, bituminous substances, calcareous substances, argillaceous substances, siliceous substances, saline substances, and precious stones, but not one single metallic substance is classed among these mineral substances, as you will notice. To show what, under this classification, are "mineral and bituminous substances," I give them just as they are recorded by Chambers in "Mining and Minerals," viz, coal, jet, amber, naphtha, petroleum, and asphalt. These constitute the "mineral and bituminous substances."

Now, let us see what is a mineral. Worcester says "it is a natural body destitute of organization or life," and that "a mineral, in its strictest sense, is a natural inorganic body with a definite composition and a regular determinate form or a series of forms." Iron ore, therefore, is not a mineral. J. P. Lesley, in his great work on "Iron," which is ex-

haustive of everything pertaining to iron regions in this country, and profuse in comparison with iron regions of other countries, says: "Once there was a time when the egg, the worm, the pupa, and the butterfly were not known to be the same creature in successive stages of development. Now the whole law of change is made out, and so is the analogous law of the crystalline formation of carbonate iron to hydrous hematite, then to amorphous anhydrous hematite, then to specular ore, and finally to magnetic ore."

Professor LeConte says, in his most admirable work, "metalliferous substances grow; we see them forming under our very eyes;" and that "iron ore accumulations are the sign of the existence of organic matter, and the quantity of the ore accumulated is a measure of the amount of organic matter consumed in doing the work."

This being the fact, I wonder that the "wisdom" of the Treasury Department did not classify iron ore under the head of "vegetables not otherwise provided for." (See Heyl's, sec. 1091.) Such a classification might be supported, perhaps. Let us see.

The first successful iron forge in this country was started by a maternal ancestor of mine (who came from Pontypool, in Monmouthshire), by the name of James Leonard, who, with his brother Henry, built, in 1652, the forge, which, with the ordinary additions and repairs required by time, is still standing in Raynham, Mass., and which, though now (1882) idle, was until within a few years worked as an anchor forge.

Dr. Fobes, in 1793, writing about these Leonards (Henry having gone to New Jersey the same year, 1652, that the forge was built, where he started the iron business), and the forge at Raynham, says: "There is a remarkable circumstance relating to this (Raynham) pond, viz, its property for generating iron ore. The beds are generally found near pine swamps and red soils where the pine or cedar grows. The Raynham forge has been run for eighty years on a plenty of bog ore, though, like other things in the state of youth, it is weak and incapable of being wrought into the best quality. The subject promises a reward to investigation. The time may come when it will be as easy to raise a bed of bog ore as a bed of carrots." I wonder that the Treasury Department did not put iron ore down for duty as a vegetable.

One thing, however, is worthy of notice, that Dr. Fobes, in 1793, had discovered the difference between the egg, the worm, the pupa, and the butterfly. He refers to its "state of youth." The hydrous hematite, or bog ore, being analogous to the worm, which must follow through the succeeding changes to attain its perfection.

Now let us see some more hair-splitting injustices which the "decisions" of the Treasury Department are given to.

"Arsenic" you will find "free of duty." It is used in metallurgy, medicines, and the arts. "Cobalt ores" you will also find "free of duty." The "cobalt ores," which are chiefly used for producing cobalt, are the iron and arsenical pyrites or "cobalt crystals."

In December, 1875, a Mr. Zeller imported some quantity of what the department decided to be "cobaltum crystals" (which was no more nor less than cobalt ore), and they also decided that the "said article not being mentioned in the tariff act is dutiable at the rate of 20 per cent. ad valorem under the provisions in Schedule M for mineral substances in a crude form." (See Treasury Department letter, 24th August, 1876, to the collector of the port of New York, and signed "H. F. French, Assistant Secretary.") On January 16, 1877, it appears that Bruecker & Koenigsheim imported some so-called "arsenic," which they claimed "free of duty as cobalt ore." The department, it seems, caused a special

report to be made by the appraisers upon this importation, upon which it decided that "it is neither the 'ore of cobalt nor arsenic,' both of which are on the free list, but it is the article commercially known as 'cobalt crystals,' which, by department decision August 24, 1876 (2945), was held to be dutiable at the rate of 20 per cent., &c.," as before quoted. This you may also see in the department letter to the collector of the port of New York, under date of March 26, 1877, and signed by "H. F. French, Assistant Secretary."

Now what is "cobalt crystals?" It is simply "cobalt ore" and nothing else. Its substance is made up of cobalt, nickel, iron, and arsenic, which combines in a crystalline form, giving it the name of "cobalt crystals." The amount of nickel and iron is always trifling—mere traces—so that the substance is cobalt and arsenic chiefly;—generally by far the larger portion is arsenic.

Another instance of the ability with which Treasury Department decisions are made, and the consequent annoyance to merchants, presents itself in the matter of "crude agate or onyx." A Mr. Becker imported, in December, 1880, and again in March, 1881, some crude agate or onyx, upon which duty was assessed 10 per cent. ad valorem, and against which he protested. The decision upon this matter says, "the merchandise is not the unmanufactured agate, which is exempt from duty, but consists of the quartz formation known as onyx and jasper, which, although comprised within the same mineralogical character (*i. e.*, quartz formation), as agate, are nevertheless different articles of commerce." The department, therefore, decided that the merchandise, not being otherwise enumerated, and being in a crude state, was properly assessed with duty at the rate of 10 per cent. ad valorem, under section 2516, Revised Statutes. (See letter of the Treasury Department of April 29, 1881, to the collector of the port of New York, and signed by "H. F. French, Assistant Secretary.")

Now, what may be deduced from these Treasury Department decisions on iron ore, cobalt ore, and agate or "crude" onyx, and steel blooms, to which I shall refer later on? Simply that by carelessness or ignorance of what they were doing they have got things all mixed up.

You see iron ore—a metallic substance; the raw, unmanufactured article of commerce used for making iron—assessed 20 per cent. ad valorem duty as a "mineral and bituminous substance in a crude state." You see cobalt ore, which the law says, free of duty, assessed 20 per cent. because it was "cobalt crystal," and which is nothing but cobalt ore. You see agate or "crude" onyx assessed under section 2516 as a raw or unmanufactured article at 10 per cent. duty, when the law says "agate, unmanufactured, is free of duty." And further, please note that agate is a siliceous ornamental stone, and is a variety of chalcedony, and onyx is a chalcedonic variety of quartz, and jasper is a siliceous mineral of the same character, and they are all of the same mineral, *i. e.*, quartz formation, and are minerals under the class of precious stones. Yet the Treasury Department has put these things dutiable under section 2516, Revised Statutes, at 10 per cent. ad valorem, when the law says they shall be duty free; and has put iron ore, a metallic substance, a raw, unmanufactured article of commerce, under "mineral and bituminous substances in a crude state" at 20 per cent. ad valorem, which ought to be only 10 per cent. under section 2516, Revised Statutes.

Chambers says that "agate, chalcedony, jasper, and kindred substances may be regarded as varieties of the same mineral."

Contrast the explanations which I have given of these different things with the rambling, shuffling method of getting at a decision, as evinced

by the department decisions, and imagine the troubles which merchants may be subjected to by a tariff law that leaves the way open for such decisions to be within the power of officials to make at all. Let the tariff law specifically name the articles to be assessed with duty on the plan of all raw materials free of duty, and all manufactured goods to be rated in accordance with the regular process of manufacture, in their respective lines; and everything else thus not provided for let it be free of duty, and leave no such power for the display of official wisdom (or ignorance), as I have quoted for your information. I could give you no end of other instances of the same sort of decisions as those which I have mentioned.

Having now disposed of the subject of classification, I think sufficiently clear—although I could present no end of authorities in addition—I will proceed, before taking up the matter of steel blooms, to consider some of the peculiar results of this ad valorem duty upon iron ores. As in most cases, where duties are ad valorem, there is a temptation offered for unprincipled persons to undervalue their importations for the sake of saving to themselves a portion of the just duty due to the government.

There is, perhaps, no single article on the tariff list which produces so small a revenue to the government, which proportionately has caused government officials more trouble than this by the undervaluation of iron ores, and in view of the trouble and expense connected with such importations, and the very small revenue to be derived from them, it would be wise to make iron ore duty free, if for no other reason than to avoid such trouble and expense to the government, and thus no longer foster a system by which rogues may circumvent the honest importer. Such competition is always detrimental to the honest importer, who will not condescend to enter into such competition.

The records of the custom-houses of New York, Philadelphia, and Baltimore are blotted over with cases of re-appraisements on undervalued iron ore. The entries of iron ore at New York which have not been raised in value by the appraisers in the past two years, are the exception and not the rule.

Last year an account was made up by the Bureau of Statistics, upon the importation of iron ore into all ports up to a certain time, giving the number of tons and the amount of duty received. I took these figures, and from them I deducted my own importations and duties I had paid to the government, and I found that I had paid to the government an average of 30 cents per ton more duty than the average of all other importers put together, or, in other words, the duty being 20 per cent. assessed, I had entered my ores at an average value higher by \$1.50 per ton than all other importers. Gentlemen, here was an average advantage of 30 cents per ton that somebody was getting over me.

It must always be borne in mind that the value upon which duty is paid is the market value free on board of the ship at the place of exportation. Thus, if I enter my good at the actual market value of, say, \$4 per ton, I pay 80 cents per ton duty to the government. If a dishonest importer enters his goods, of the same comparative value, at \$2.50 per ton, he only pays 50 cents per ton duty to the government, thus getting 30 cents per ton advantage of me.

In the port of New York, out of fifty-nine reappraisements of iron ore in 1881, there appears but nine of those cases which were not advanced over the entry valuation—the advances sustained ranging from 1 $\frac{8}{10}$ per cent. (in a single instance) up to 108 per cent.; the large majority of the advances sustained ranging from 20 to 99 per cent. advance.

The roguery of such importers may be traced by an examination of entries at different custom-houses on the same, or nearly the same, day, upon invoices for the same kind of ore, and shipped from the same port at the same time, and there compare the facility with which they will swear an invoice through one custom-house at one valuation, and through another custom-house at another valuation. Surely, this sort of thing, happening so systematically, cannot be an error excusable. For instance, one importer swears an invoice, dated February 17, 1881, through the Philadelphia custom-house, at say $15\frac{1}{2}$ francs, and another, dated March 3, 1881, at the same valuation, and at Baltimore the same importer may be found to have sworn an invoice of the same through that custom-house, the invoice being dated February 19, 1881, at say 13 francs per ton. So now you have the complete illustration: February 17, Philadelphia at $15\frac{1}{2}$ francs; February 19, Baltimore at 13 francs; March 3, Philadelphia at $15\frac{1}{2}$ francs.

These are only a few instances out of many more that might be cited of these irregularities, but added to the irregularity in the values comparatively as entered they were all undervalued, as they should have all been entered at 17 or 18 francs.

During one month, January, 1880, the records show that one kind of ore was sworn in upon entries by different importers at the following prices: \$2.55, \$2.67, \$2.75, \$3.58, \$3.89, and \$4.86 per ton. Thus it may be seen that the duties paid per ton were 51 cents, $53\frac{2}{5}$ cents, 55 cents, $71\frac{2}{5}$ cents, $77\frac{4}{5}$ cents, and $97\frac{1}{5}$ cents. Here is an extreme difference of $46\frac{1}{5}$ cents per ton, which the hardest swearer got the advantage of over the man who made his entry honestly and paid the duty accordingly. I could give you no end of these instances, all in accord with the general complaint which you will find made by honest importers in other lines of trade, who are subjected to the same annoyances from such dishonest competition.

My observation goes to show that rogues have their pet custom-houses where they swear their entries through at the lowest rates. For instance, I find one importer swearing an invoice through the New York custom-house at a value of \$3.28 per ton, and at the same time, for the same goods, shipped at the same time, he has the audacity to swear an invoice through another custom-house at a valuation of \$2.23. It is plain to see that at New York he had to pay $65\frac{2}{5}$ cents per ton duty, while at the "other" custom-house he only paid $44\frac{2}{5}$ cents per ton duty; and it may be needless to anticipate your presumption, that the "other custom-house" got a wonderful amount of such importations. I have not mentioned any names of persons, but I refer to facts capable of proof, and I happen to have those proofs in my possession.

You have been very naïvely told that "the endless trouble and confusion that has been caused by this question of 'free on board value' on the date of a vessel's sailing from the other side has so thoroughly wearied the government employes and all importers, that 'the speaker can confidently say, that they one and all will join in requesting that the duty (on iron ore) be made specific.'" And yet twice on the same page that same person asks for iron ore to be duty free.

The question of free on board value is the simplest question possible for the importer, and the honest importer will so enter his goods that there need be no "endless trouble or confusion" to government officials or to other importers. But so long as iron ore stands subject to an ad valorem duty, just so long you will find foreign adventurers (and perhaps some citizens), without any other interest than to make money by avoiding the proper duties; and just so long honest importers will be

subjected to annoyance and loss, and government officials to endless trouble. And here I desire to say, that from a somewhat extended experience with government officials, it becomes my pleasure to testify that they are, as a class, a very honorable set of men, conscientious in the discharge of their duties. The abuse that is sometimes showered upon government officials is without a just cause, and without any just appreciation of the labors which some of them have to perform, or the variety of things upon which they have to act, which, to do intelligently and well, requires a man to be a combined cyclopædia of revised statutes, mechanical, chemical, and physical sciences, versed in mercantile and commercial usages, customs, and values, and to have at his tongue's end all the special decisions of the Treasury Department (which by the way are as contradictory as possible, and which a "porpoise could not follow," as an old captain once told a wheelsman who was steering his ship's course in all directions but the right one).

My sympathies are with the government officials, many of them men who have seen better days, plodding out the last remnant of their lives, serving at a beggarly salary, giving an amount of labor, intelligence, and faithful performance of duty, which in mercantile affairs is comparatively rewarded by double their salary. It is their faithful performance of duty that brings upon them the displeasure of dishonest importers, and it is the dishonesty of importers which causes them annoyance and an increased burden of labor. The government officials who come in for this abuse, and who I stand to defend, are the appraisers and their faithful assistants, who have the integrity in their positions to advance the invoices of dishonest importers. Those officials who do not do their duty will find no sympathy from me, and there are some who, if their cause ever comes before me for my consideration, will have to face some very blunt facts.

I now desire to call your attention to faults in the system of entries. Entries are made by anybody. The irresponsible adventurer, or the transient foreigner, may make an entry, or a number of entries in succession, and give a bond, in a mere matter of form way, which is not worth a straw—literally a "straw bond"—upon which they get possession of their goods. The sample is, meantime, taking its due course through the appraiser's department. If it is reported upon as "advanced," the adventurer or foreigner may ask a reappraisal in the form prescribed. The reappraisal takes place, the "advance" is established, and the papers returned to the collector, who proceeds to collect the additional duty and fine or penalty which the bond is supposed to cover. The collector finds the importer either decamped or refuses to pay the bond, a mere "straw bond," and the goods delivered and out of reach. After some delay and failure to collect the amount due, the collector sends the case to the district attorney for suit, which takes its due course on the calendar. If a judgment is obtained it may be worthless.

By this procedure you may see that our tariff is an open bid for dishonest importers to cheat the government, and by the amount of duty thus saved undersell the honest importer. How many cases has the government got now pending against iron-ore importations alone in New York, Philadelphia, and Baltimore? You will probably find a large number, involving a large sum of money.

Another point to be considered is the system of reappraisements. For instance, an importer has invoices of goods coming through bankers who have advanced part of the purchase-money upon them. The goods may be coming to some outport where the bankers have an agent, to

whom they send the invoice and bill of lading—documents as they are called. This agent delivers the documents to the importer upon a trust receipt when the importer is not of known responsibility. (In my own business I have never yet given one of those trust receipts.) The importer then enters his goods, say, at a valuation of \$2.25, gets his permit, lands his goods and gets them away. Meantime the appraiser reports an "advance." The importer asks a reappraisal, and then the matter goes before the general appraiser. A "merchant appraiser" is appointed, who may be the banker's agent. The banker's agent knows the irresponsibility of the importer to meet additional duty, fines, or penalties of thousands of dollars, and pay him the amount required and due on the trust receipts given for account of his banker's principals. The "banker's agent" and "merchant appraiser," both being the same person, acts, not upon his oath as a "merchant appraiser," but upon his interests as banker's agent, to secure the amount due to his principals. He simply goes through the form of doing the reappraisal, by confirming the entry of the importer, entirely regardless of overwhelming evidence to the contrary. Hundreds upon hundreds of thousands of dollars may be filched from the government in this manner.

You may some of you remember the triangular arrangement put up by cotton-tie importers in a large southern port, where three importers controlling that trade at that port, secretly in partnership, though apparently open competitors, conspired to evade the proper duties on the cotton-ties. No. 1 would enter an invoice at a low price; No. 2 would be appointed merchant appraiser and sustain the entry of No. 1. The next time No. 2 would make the entry, and No. 3 would be the merchant appraiser and sustain the entry of No. 2. The next time No. 3 would make the entry, and No. 1 would be the merchant appraiser and sustain the entry of No. 3. And so they went on round and round, until finally the Treasury Department authorized the collector of the port to appoint any respectable merchant as merchant appraiser; and by this means the fraud on the government was finally circumvented. Though the trio might protest against the appointment of a merchant, not being a cotton-tie importer himself, upon the ground that he was not an expert, and thus not a proper person to act as merchant appraiser.

All of this sort of trouble may be avoided by prescribing a form which shall require all importers and their bondsmen to be American citizens of known responsibility and respectability, and the moment an advance is made to make a deposit of the amount which such advance would require, if sustained, to be paid in the form of additional duty, fines, or penalties, plus 10 per cent., with the collector of the port, or to return the goods to government stores to await the adjustment of the entry. And no importer or bondsman, under any deficiency to the government, should be allowed to make an entry or make a bond at any custom-house in the country during such deficiency. Such a form as this would have saved the government large sums of money in the past few years, and prevented dishonest importers from making a dishonest competition and consequent loss to honest merchants.

An illustration of the incongruity of the present tariff law in its classifications is also afforded in the matter of "steel blooms," so called, and through which incongruity there has opened a means of evading the law. The present law says distinctly that "metal converted, cast, or made by the Bessemer or pneumatic process, of whatever form or description, shall be classed as steel," and further provides that "steel in ingots, bars, coils, sheets, and steel wire, not less than one-fourth of one

inch in diameter, valued at 7 cents per pound or less, shall pay a duty of $2\frac{1}{4}$ cents per pound."

In the Bessemer practice, the original ingot was cast of the size suitable to make one rail. As the practice grew in importance, it grew in its methods, and larger weights of molten metal were handled by using larger converters; then came the practice of casting larger ingots of size to make two or three rails. These ingots of increased size were cut to make two or three rails, as the case might be, and such parts became known technically as "blooms," as a distinction from the large ingots. It was easier to apply such name to them than it was to call them "half ingots," or "third ingots," or to call the large ingot by the name of "double ingot," or "treble ingot."

What has within a few years come to be known as a "bloom," is in fact, and for the purposes for which it is used, practically what the original Bessemer steel ingot was. The present "bloom" is not a "bloom" at all, strictly speaking. A "bloom" is made from ore direct, by smelting ore in a charcoal fire, or by sinking, as it is called, scrap iron in a "sinking fire."

This new term of "bloom," as applied to the Bessemer steel ingot, opened the way for the cupidity of importers (of which there are always some ready to resort to any turn to evade the law, and trust to the carelessness or ignorance of officials to decide in their favor) to import these so-called "blooms" and enter them for duty at 30 per cent. ad valorem as "steel, in any form not provided for."

But the officials, where this entry was made, with a remarkable degree of discretion (?) and a more remarkable desire to show their official integrity, raised the duty on the so-called "blooms" to 45 per cent. ad valorem, under that portion of the tariff law which says, "All manufactures of steel, or of which steel shall be a component part, not otherwise provided for, 45 per cent. ad valorem." There happened to be a convenient period at this point, and the official evidently read no further; and surely the importer did not wish him to read further—just so far suited his case—for there it distinctly says, immediately following that convenient period, "But all articles of steel partially manufactured, or of which steel shall be a component part, not otherwise provided for, shall pay the same rate of duty as if wholly manufactured."

However, upon this advance of duty, the importer went through the formality of an appeal to the Treasury Department, where the rate of 45 per cent. was confirmed by H. F. French, Assistant Secretary, a son-in-law of a late Secretary of State, being employed by the interested importers to make a forcible argument before the Treasury Department, which resulted in the final decision referred to.

I was personally present in the Treasury Department at the time and heard the whole thing. It reminded me of a story about a young clergyman, who was called to preach a sample sermon with a view to giving him a permanent call. After the sermon the parish committee asked the opinion of a highly educated old gentleman in regard to the sample sermon. The old gentleman replied: "If that young man's text had had the small-pox his sermon would never have caught it."

Comments upon the action of the Treasury Department are useless, in view of the law before recited, but it may be fair to presume that such action was quite agreeable to the would-be regular importers of "blooms," and quite unsatisfactory to the Bessemer steel rail manufacturers.

Here was a decision which was an act of absolute injustice. The ingot must pay $2\frac{1}{4}$ cents per pound duty, but just cut it in two or three

pieces and it would come in for about half a cent per pound. The finished steel rail would have to pay 1½ cents per pound. So here were the Bessemer steel rail makers with all their immense works for making their rails, through the whole process from smelting the ore to rolling the finished rail, cut short at the very last operation but one in their work by this act of official carelessness or ignorance. This is but another of the many things that could be cited to show the dangers which such official action may submit merchants and manufacturers to under any such tariff law as the existing one. If the theory under which this action would seem to have been taken were to hold, you can easily see that the material, in the course of manufacture, was reduced in dutiable charges as it progressed toward the finished rail. For the ingot must be subject to 2½ cents per pound, but just cut the ingot into two or three pieces and then it might be introduced at about half a cent per pound. This decision is so preposterous that it only needs to be called to your attention to be appreciated.

You will doubtless be impressed with the ardor with which many persons desire the government to grant them some special protection for their own personal advantage by which they may get two dollars for one.

You will no doubt wish yourselves able to solve the problem by which you can recommend the government to grant such favors to all, and thus bring upon yourselves the gratitude of all.

But with my appreciation of your task, I predict that such problem will remain unsolved by you, and that your labors, which you have so arduously performed without remission through the past summer, will be as unthankful as they have been arduous.

Now, you may be wondering what I want the Tariff Commission to do for me.

As I have told you that I am the pioneer importer of iron ores into this country—the first to introduce them for regular use in this country—and that I am the only person in this country who owns any foreign mines, or controls any foreign ores, you may imagine that I want the government to pay me a bounty upon my ore brought to this country. I am obliged to disappoint you. The only protection or bounty that I ask for is that the government will no longer maintain an ad valorem duty on iron ore, and thereby offer a premium for foreign rogues to come here and enjoy the privileges of our country, and cheat the government out of 20 cents to 50 cents per ton, by which they make a dishonest competition to my detriment and loss. This is just exactly what the present tariff on iron ore amounts to. Yet, if the government is going to protect everybody else, I don't see any reason why my capital invested in foreign mines, the product of which is, and will be for years to come (secondarily to my own personal benefit to be derived from them), an important source of supply for American works.

Any action by our government which would prevent or decrease the ability of American works to avail of such supplies would be hailed with delight among English, French, German, and Belgian works, for, to whatever extent our tariff laws may prevent, by so much increased cost, the consumption of foreign ores, it also so much lessens the gap, affording such foreign works less disadvantage in competition in the American markets.

The government would do a wiser thing to allow and pay to me a bounty, than to impose a tariff on iron ore under all the circumstances which surround this question.

But I claim that the government has no right whatever to pay me a

“protective bounty” any more than it has to make for anybody else a “protective duty.” But I do claim that if the government imposes a duty upon iron ores at all, that iron ores which come from mines owned in fee or lease by American citizens, and if the same are operated at the expense and risk of American citizens, such product shall be duty free. Such property or wealth is as much a part of our national wealth as the property or wealth of any other citizen, and in view of the value to our manufacturing interests, as a source of supply, is as much entitled to the protection of the government as anything else.

I ask that you will either make iron ore duty-free, upon the principles which I have already cited for raw materials, or that you will practically prohibit its importation by such a high specific duty that will forbid its importation at all. Either horn of this dilemma which you may accept as the “horn of plenty” for the American iron trade, will be acceptable to me in preference to the present tariff.

A meeting has of late been held at Cresson, Pa., for the purpose of organizing into an offensive and defensive protective society. What was that meeting composed of? Many very respectable Western people, but scarcely an Eastern man of any prominence or leading position in the iron trade. I notice the name of one very prominent wire manufacturer of Massachusetts, one representative of an ore mine on Lake Champlain, one or two bar iron makers, and one Bessemer steel maker. But the absence of any representatives, at that meeting, of all the Massachusetts and other New England rolling mills, or the great Bessemer steel works at Scranton, Bethlehem, and Harrisburg, or the largest iron companies of the Lehigh Valley, is a very significant thing.

The report of that meeting is indicative of the supremely selfish interests that sought to control it, and the manner in which they wrangled over the different degrees of protection which each interest claimed as its right in precedence of others, is clearly indicative that the representations for a tariff on iron and steel from that meeting should be of little weight with you in making up your report.

Among those recorded at that meeting as “iron-ore producers,” there are a number who never produced a ton of iron ore in their lives, some were foreigners who have no business whatever in discussing our tariff matters in such a meeting, and one nondescript, which later developments may give me an opportunity to characterize before a different tribunal than the present one.

Mr. Andrew Carnegie, who is, I think, the largest individual owner in Bessemer steel works in this country, and whose works and furnaces are at Pittsburgh, Pa., and who has had the good sense to appreciate that the interests of the country are identical with his own, introduced a resolution at that meeting, viz:

Resolved, That it is the sense of this (Cresson) convention, that any proposed change of duties should be in the direction of a reduction, except where by false rulings, or misconstruction, the spirit of the law has been violated, especially in those cases in which manufactures of a more advanced stage have been admitted at lower rates of duty than are imposed upon crude forms of the same material.

One report says Mr. Carnegie was declared “out of order.” However, Mr. Carnegie’s good sense was not adopted as the sense of the convention; and when the committees were made up Mr. Carnegie, “the noblest Roman of them all,” had no place on the committees. After the schedule was made up for the rates of duties to be presented to the Tariff Commission, Mr. Carnegie is reported to have made a short speech, in which he said, that he “wondered if he hadn’t lost all his judgment and good

sense." That convention evidently acted contrary to Mr. Carnegie's judgment and good sense, and totally ignored his resolution.

One man wanted \$1,000 per ton duty on pig iron, which received great applause. Another wanted \$20 per ton (quite a difference in their wants), but he had the good sense to say that it was nonsense to talk about what could not be had.

Finally, this "Western convention" traded interests among themselves until they agreed (though some threatened, up to the last moment, to bolt for the Tariff Commission on their own account) upon a schedule of protection to their mutual (?) satisfaction. It embodies 85 cents per ton duty on iron ore, and \$8 per ton duty on pig iron. Other things were in proportion, except steel rails, which were reduced. And here comes in the illustration of the matter which I referred to when speaking about ores particularly. The Western manufacturers evidently have sinisterly managed this scheme, as they thought, to elude discovery. They will ask you to handicap their Eastern competitors by 85 cents per ton duty on ores, which means \$2 per ton (including waste and expenses) on rails. Then they reduce the duty by \$5.60 per ton on the rails, presenting their Eastern competitors to a both front and rear attack. The Western mills are so far inland that Eastern and imported rails are handicapped against them, by \$5 to \$7 per ton transportation, for competition in the West. Upon the coast, and places adjacent to the coast, where the Eastern mills would feel the competition of imported rails the most, they are reduced in their protection by \$5.60 per ton. Thus, with the advance on the cost of the raw material and the reduction on the duty, it makes \$7.60 per ton. By this time you may begin to see why none of the large Eastern interests were represented in that convention.

The tariff as drawn up by that convention, based upon the present and prospective consumption of iron in this country for the next ten years, means a tax upon the purchasing power of this country of about \$206,170,000 per annum.

In the matter of steel rails, in the great growth which the West promises, and the consequent extension of railways and the consumption of steel rails which must follow as a natural sequence, these Western people will ask you, by the tariff proposed, to handicap their Eastern competitors as against themselves by \$2 per ton increased cost of the raw material, and thus, by the average cost of freight upon Eastern rails to the West, the Western mills will practically have the same protective duty which the Eastern mills now have on the coast from the present tariff, plus \$2 per ton.

This \$2 per ton in a period of extreme depression might be the means of bankrupting many millions of capital represented in these works.

It becomes your duty, therefore, not to allow that tariff on iron ore to be enacted at all, if your report to the contrary shall have any influence upon the enactment of a new tariff law, as I believe it will. I suggest that with a fair and unprejudiced view of all the interests of the country the "iron tariff" might be adjusted as follows:

The raw material, iron ore, duty free. The next in course of manufacture is pig iron; make that \$7 per ton of 2,240 pounds as at present. The next in course is muck bars, and castings of all kinds; make those \$7 per ton and 25 per cent. ad valorem.

Now we have branched into the two processes, wrought and cast iron. I will only proceed with the wrought iron for my illustration. The next in course includes the manufacture of forgings, bars (flat, round and square), sheets, plates, hoops, straps, &c.; make those \$7 per ton and 25 per cent. ad valorem, plus 10 per cent. Then all machinery 35 per

cent. ad valorem as now. This is the only equitable way that I can see for you to treat the different interests; for the moment you begin to protect one by any tariff you must see that the direct course of manufacture is properly followed up.

In the Bessemer or pneumatic steel process, I would suggest it as proper to provide that all steel made, cast or converted by the Bessemer, pneumatic, or any other advanced process, for producing the same class of steel, should be subject to the following rule, viz: ingots, blooms, or any other form which may now be known, or by any other name which such forms, or parts of forms, may become to be known, less finished than a steel rail, regardless of size, shape or condition, shall pay the same rate of duty as a steel rail, which shall be fixed at \$22.40 per ton of 2,240 pounds.

Then all manufactures of such material, other than steel rails, such as wire billets, rods, bars, and wire, should pay \$22.40 per ton, plus 25 per cent. ad valorem.

In other lines of other manufactures you must follow the same comparative sequence, or some link in the chain will be the breaking place, by which another "steel bloom" iniquity may be enacted.

These sequences in iron are sufficient to illustrate my idea as to the only way in which a tariff can be made, and be equitable and just. It also forcibly illustrates by what compounding strides the cost of things augments when we first begin to enact a duty upon anything, and it should be of such effect upon your minds as to lead you to simplify our tariff down to as few dutiable lines as it is possible to be done.

This compounding ratio, if carried into all the different lines of merchandise as a protective element, would soon absorb the whole purchasing power of the nation for consumption, and leave every manufacturer to use or wear his own goods, which was very much their condition during the period from 1874 to 1879.

Let us not forget the experience of the past, nor presume that such times may not return; but let us prepare for such times by being always as near as possible on the lowest possible plane of first cost in all lines of manufactures.

Now a few words for our Eastern manufacturers. Fuel is one very important factor in the cost of manufactures. Anthracite coal is free of duty, but bituminous coal is subject to a duty of 75 cents per ton.

To many of the Eastern cotton, woolen, iron, and other manufacturers this is an important item, 75 cents per ton meaning a tax upon many of them of from \$10,000 to \$15,000 per annum. In the light of economy that means the interest upon a large sum of money per annum.

Bituminous coal should be free of duty, as a means of reducing the cost of manufactures in the Eastern States, where by far the largest amount of capital is invested in manufactures, as compared with any other section of the country.

I believe in free trade, in theory, but "practical free trade" and "absolute free trade" are different things, and yet practical free trade is the only free-trade theory that we can hope to ever adopt. We must, however, adopt a system of freer trade, and by doing so we shall increase our commerce, enlarge our manufactures, and benefit the entire population.

We have large amounts of capital invested in manufactories which has been induced therein by the delusive profits which some suppose "protection" assures. You must not let the specious arguments of protectionists lead you to recommend the continuation of such a system.

This capital it is your duty, however, to preserve, not on any personal

ground in favor to any particular owner or society of owners, but on the broader ground that it is a part of our national wealth which our national folly has imperiled by misdirection.

A too sudden change from the radical protective policy to the radical free-trade policy will surely sacrifice a large part of that national wealth just referred to.

The themes of free trade are poetical and luring, clothed in all the sentiment and attraction of that which speaks to our hearts and convinces our minds. You, however, must not be captivated by these any more than by the sophistries of the protectionists. You have practical difficulties to overcome requiring a stoic nerve. This capital which I have referred to must be preserved productive and remunerative, that it may continue a source of national wealth.

I would call your attention to the requirement of your action according to the Constitution of our country.

Article I, section 3, of the Constitution says:

Representatives and direct taxes shall be apportioned among the several States which may be included within this Union according to their respective numbers, &c.

The word "shall" is fully as imperative in relation to "direct taxes" as it is in relation to representatives. We have the representatives, but the other requirement we have not.

Yet, the framers of that Constitution, in their wisdom, foresaw the necessity of representatives and direct taxes being apportioned under the same rule. I apprehend that they saw that this system would be a check upon improper representation and upon improper expenditures, as the people of each State would thus be brought to the realization of the cost to themselves of representation in the national government by the taxes paid for its support, and they would also hold their representatives to a more rigid accountability for the expenses of the government.

I need instance only one thing. Suppose the recent infamy of passing what has become to be known as the "harbor and river steal bill" over the veto of Chester A. Arthur could be fully realized by the people, and they had to pay direct taxes accordingly to the requirements of the Constitution in proportion to their representation. Do you suppose that the people's representatives would dare to face their constituencies after such a reckless misappropriation of their money? I do not believe that one out of twenty of those men under a constitutional system of taxation would have dared to have voted over that veto, even if they had the will to have voted for the bill before it was vetoed. And I doubt very much if any representative would have dared to have introduced such a bill into existence at all.

I suggest that all those expenditures of the government necessary to maintain the civil, judiciary and diplomatic, interior, civil and military and naval establishments should be met by direct taxes upon the respective States. This would require assessments upon each State of \$2 per annum capita tax, to be paid by the State treasurer to the Treasurer of the United States.

By this the tariff revenue, which now amounts to \$4 per annum capita tax on each person in the country, could be reduced one-half, and thus afford the opportunity to simplify our tariff law, which seems to me so necessary to do.

I suggest that the process by which this simplification should be accomplished is to adopt certain principles, which the condition of the various interests of our country make tenable from an unprejudiced view.

First, make all fundamental raw materials—*i. e.*, such as enter into the first process in the staple manufactures of the country—duty free.

England, for instance, affords her manufacturers all raw materials free of duty, and the records show that 91 per cent. of all the imports of England are raw materials and food free of duty. That is the foundation upon which she builds her system of manufactures, and upon that foundation has she built the grandest commercial and manufacturing system in the world or that the world has ever known.

This would place our manufacturing industries upon the bed-rock foundation as near as possible, in point of competitive first cost, to those of other great manufacturing countries.

Second, in consideration of the condition in which many of our manufacturers are at a disadvantage, from extra cost of labor, extra cost of interest on capital, &c. [One very important consideration in our extra cost of interest money is the amount of money required to carry on our manufacturing operations. The increased rate is in almost exact proportion to our system of making everything cost more than it legitimately should. Those countries whose system tends to the reduction of first costs require less money to carry the operations through, and pay correspondingly a less rate of interest.] Make only a fair compensative duty upon such manufactures, if imported from another country, as shall give our manufacturers a fair margin, and at the same time make a healthy competition and give a reasonable revenue through the customs. Make in no case a prohibitory protective tariff. Such is contrary to the principles of our Constitution, contrary to our boasted freedom, and contrary to any principles upon which the administration of equity and justice to all classes of citizens can be made.

A prohibitory protection is contrary also to the enlargement of commerce and to the perfection and excellence of manufactures.

Cowper wrote:

* * * * * and Art thrives most
 Where commerce has enriched the busy coast;
 He catches all improvements in his flight,
 Spreads foreign wonders in his country's sight,
 Imports what others have invented well,
 And stirs his own to match them or excel.
 'Tis thus, reciprocating each with each,
 Alternately the nations learn and teach,
 While Providence enjoins to every soul
 A union with the vast terraqueous whole.
 Heaven speed the canvass gallantly unfurled
 To furnish and accommodate a world,
 To give the pole the produce of the sun
 And knit the unsocial climates into one.

A prohibitory protection has driven our commerce from the seas. Where is our "canvass once so gallantly unfurled to furnish and accommodate a world"? Gone to the possession and ownership of other nations.

From one of those beautiful stanzas of Joseph Rodman Drake on "The American Flag" we must strike out the first two lines, viz:

Flag of the seas! on ocean wave
 Thy stars shall glitter o'er the brave.

"Flag of the seas!" What a jest. "Flag of the seas!" The flags of England, of Germany, of Norway, of Italy, of Spain, but not the "Star Spangled Banner."

Out of a foreign commerce last year of nearly \$2,000,000,000, only 16 per cent. was carried in American vessels, under American canvass, under our boasted "flag of the seas," while 66½ per cent. of that commerce was carried under the British flag. Twenty-five years ago the American flag waved over 75 per cent. of our foreign commerce.

It becomes your duty, by every means, to simplify our tariff, to expunge from its list every petty item of dutiable merchandise, of which there are many, which do not yield revenue enough to pay for the trouble and cost of collecting.

We have over 2,000 articles on our list, of which but a few are of importance to keep on, outside of those which come under the head of manufactured goods. Some of the necessities of life, like salt and rice, are taxed nearly 100 per cent. duty, and salt should be admitted duty free, as it is of the utmost importance to so many of our great industries, particularly the provision and chemical trades; and, too, if rock and run-of-mine salt could be imported duty free, it would also become of vast benefit to our agricultural classes by affording them a cheap mixture for their composts. Salt under our present tariff is subjected to a duty of \$1.80 to \$2.70 per ton, and only yields a little over \$900,000 per year.

It becomes your duty to take cognizance of things not on the tariff list which are available for revenue according to one of the greatest principles of taxation, *i. e.*, to lay taxes in such manner as to be least felt by the tax-payers.

An eminent French statesman and economist once said that "the science of taxation was plucking the feathers from the goose in a manner that the goose would not feel it." If anybody has ever seen the process of picking "live-goose feathers" they will appreciate this simile.

For instance, take tea and coffee. I know the sentimental argument about the poor man's cup of coffee, the poor woman's cup of tea, and the political demagogue's use of such twaddle for political favors; but it is nevertheless your duty to consider that they are two of the most available articles of commerce for revenue, and the revenue once established on these two articles will scarcely be felt, and if you do your duty in regard to manufactures and some of the other necessities of life which enter into the consumption of the poor man and the poor woman, by reducing the cost of such, you will pay many times over for the extra tax on the tea and coffee.

There is yet a resolution "lying on the table" in Congress for placing tea and coffee on the tariff list again, which was introduced by the Hon. Mr. Dawes, of Massachusetts, I think in 1874, and still awaiting action. This resolution was offered immediately following some correspondence I had with Mr. Dawes, in which I suggested such action.

By the statistics of 1881 you will see that our consumption of coffee was a little over 434,000,000 pounds, or about 8½ pounds per capita of our population. A tax or tariff on coffee of only three cents per pound would give us a revenue of over \$13,000,000. Our consumption of tea for the same time was over 79,000,000 pounds, or about 1½ pounds per capita. A tax or tariff of only ten cents per pound on tea would give us nearly \$8,000,000 revenue. Here is over \$20,000,000 revenue available which would be paid in such small sums that nobody would feel it. England collects a tariff on tea and coffee a trifle higher than the rates which I have suggested.

Simplifying our tariff in the manner I have suggested will decrease the cost of production of manufactured goods, thereby bringing such within the purchasing power of the greatest possible number of our own people, and also thereby, from the demand thus made by increased consumption, enlarge and extend our manufactures, employing more hands at labor to again become, at the same time, consumers of the various products of labor.

No legislation should be enacted which unnecessarily increases the

cost of any article, and which thus decreases the purchasing power of the people to consume.

The follies of the past must be corrected if ever we expect to take a competitive rank among nations in our manufactures and commerce and restore our flag as the "flag of the seas."

In making any change in the tariff these great economic questions cannot be too carefully considered, that in a new tariff the evils of the old shall not be in any form continued.

Gentlemen, in recommending to Congress your bill for a new tariff, you have a sacred duty to perform.

Finally, I commend to your favorable report that of enacting all raw material free of duty, and only a fair compensative and competitive revenue duty on manufactured goods, aiming at the equivalent of 25 per cent. ad valorem, and if any interests are, as there are some, in such condition that their capital would become a fruitless factor in the national wealth by one reduction to that standard of duty, let it be enacted that a yearly reduction shall follow after three or five years until it is reached.

Any industry which will not survive such a course ought not to survive at all, in a country like ours, where the maintenance of labor may be made so easily. Let any line of manufactured goods, which, after the next five years, shall not produce to the revenue an average of \$100,000 per annum, for the succeeding five years, be enacted to take its place upon the free list as free of duty.

I also commend enacting direct taxes, and maintenance of the internal-revenue taxes. By these enactments, aiming at a revenue from tariffs of about \$100,000,000, and from direct tax \$100,000,000, and from internal revenue \$150,000,000, and from miscellaneous sources \$50,000,000, a total of say \$400,000,000, I apprehend that this course will afford the revenue at less inconvenience to the people than any other, and provide for all the net ordinary expenses of the government which an honest administration have any business to incur (including \$65,000,000 for interest on the public debt and \$50,000,000 for the sinking fund), say \$290,000,000, which is about \$6 per capita of our present population. This would leave us \$110,000,000 per annum for application to payment of the principal of the public debt, and, or for, any exigency which might arise.

E. D. GOODWIN.

NEW YORK, *October 4, 1882.*

Mr. E. D. GOODWIN, of Falls Village, Conn., a farmer, addressed the Commission as follows:

GENTLEMEN: In appearing before your honorable body and advocating a modification of our present tariff rates by a reduction of 10 per cent. thereof, to take effect June 1 next, and 10 per cent. more at the expiration of two years, thus gradually reducing its average from 45 to 36 per cent., I have no special interests to subserve, as many who have appeared before you.

Wool and mutton, grain, beef, and butter are my chief products, and whatever fancied sacrifice such reduction may bring to me, I cheerfully accept in subordination to the interests of all. My position is such that I am compelled to combat its adverse influence upon me and upon the nation, upon the general principles of equity and fairness as applicable to the high trust of constitutional administration. I protest against it as both unjust and impolitic—at variance with correct principles of economic production, adverse to us in the long run—and unbecoming our position, wealth, and development among the more prominent nations of the world—distinguished alike in science and in art—each struggling for its ascendancy in industrial resources and in commerce, with a spirit in keeping with their intense activities, their high civilization.

As a farmer I am located in New England; for fifty successive seasons on its sterile soil have I struggled with its extremes of heat and cold for a competence; of my various products I can raise but one crop a year, and that at the hazard of storm, blight, and drought, while my manufacturing neighbor—but give him a market—can multiply his wheels ad infinitum, and there is no limit to his products and his profits.

Long before our civil war they had laid the foundations of their liberal fortunes; through it and since, under your extreme protective system, they have become the millionaires of the land, dominating in politics and monopolies alike; and to me, born and bred as it were to the soil, it cannot but be humiliating to witness your Commission, the conception, the inspiration of these interests, traveling over the land listening to their plaintive tones for bounty still, with scarcely a single farmer in the whole land to assert his rights and his manhood. Have I no interest in the matter, and no standing in court? Am I not on a footing of equality as to rights and interests, and have I no grievances at the hand of government?

What are my products worth but what our agricultural surplus brings in the European markets, and that dependent there upon the ability of labor to consume at their rate of wages, while in those markets I have to compete with the cheap labor and lands of all Europe and the Indies, with the Atlantic between us, with its freights and commissions.

My neighbors, these clamorous, bounty-loving manufacturers, are feeding their labor at a cost less than their foreign competitors by ocean freightage, insurance, and commissions, while this same ocean bearer intervenes to protect their fabrics, besides a 45 per cent. average tariff, and perhaps a long line of inland transportation.

There seems no limit to human audacity. When the tariff of 1862

was enacted, it was justified only by the exigencies of civil war, and so great was the injustice and favoritism of the measure, that an internal or drawback tax was levied on manufactured products, ostensibly to come out of the pockets of the manufacturer himself, but in fact charged to cost of product and paid by the consumer. Why this favoritism, this domination of one interest to the prejudice of all others, and this a minor interest?

About three-fifths of our people are engaged in agriculture, one-fifth in trade and commerce, and one-fifth in manufacturing, and there must be "something rotten in Denmark" with its government inspired and controlled by one-fifth of its people.

It is an undisputable fact, demonstrated by its fruits, that this class have aggregated to themselves more than their share of the national wealth; they are in the ascendant in government, a privileged class, fortified in their position by dominant political fallacies, and appeals to the laboring classes.

This tariff was a war measure modified by the tax on products, supposed to be a part of the profits rendered back into the Treasury as a compensation for the favoritism; but soon after the close of the war, and in the flush times succeeding it, this drawback tax was abolished, and the tariff left substantially as it was as to rates, and it has come down to us unchanged, save the reduction of 10 per cent. in 1872.

In our system of government, State and national, individuals and interests as to rights, obligations, and opportunities are supposed to be on a footing of equality before the law. The States are sovereign over all local matters, the general government is guardian of interests common to all and is sovereign in the exercise of all powers granted to it in the organic law. The trust of government is to be exercised equitably and impartially, and the general welfare, a welfare common to all, should not be lost sight of; and all interests are alike sensitive to this principle in the exercise of your revenue powers.

These interests may be classed as agricultural, manufacturing, and commercial—agriculture being the base or foundation interest upon whose prosperity the others largely depend. Here are fifty millions of people, with their varied and conflicting interests to be affected by the exercise of your revenue powers; and the great and vital question is how shall these functions of government be so administered, according to the letter and spirit of the organic law, and so in harmony with the conflicting interests at stake, as to best promote the public good, the general welfare. Bear in mind all interests, every individual, is on a footing of equality before the law, and equity commands fairness and impartiality, with laws so adjusted as, approximately at least, to make tributary to the general burdens all, according to their ability to respond.

Your organic law empowers a tariff for revenue purposes, and, to meet the necessary expenses of government, with judicious administration, a 30 per cent. levy would be ample, and all that sound policy would dictate from this source. This is an incidental protection, the necessity and justice of which no one can dispute, giving to the home fabricant this advantage over his foreign competitor, aside from the cost of transportation, risks, and commissions.

Even this tax falls not equitably upon the people according to their ability to pay, but in a ratio to the consumption of the individual; falling on the laboring man of large family altogether in disproportion to his means. Time was when this discrepancy of burdens was modified by a general income tax, but this just, equitable resource had to yield to the fiat of our bounty-loving manufacturing friends.

If these objections are pertinent and well grounded, on the score of equity and fairness, as against a revenue tariff, how much more so when pitted against your present highly protective system? The burdens of government should be borne equitably among our citizens according to their means, that all may become so interested as to insist on purity and economy of administration.

The same law holds to the nation as to the individual; flush resources leads to liberal expenditures, and extravagance and demoralization follow in their train. It is not wise in nations or in individuals to antagonize natural forces, set at naught the laws of trade and of an enlightened political economy for a mere temporary prosperity; your policy to be fixed and permanent must be based upon the organic law, conceived in equity and fairness, alike in the interests of all and of coming generations.

The advocates of the present highly protective system make great pretensions of sympathy for the laboring classes; it is enough to show their duplicity in this respect to recapitulate what I have already said, that while they have relieved themselves of the internal taxes on manufactured products, of the income tax also, the burdens of government are left to fall largely upon the people according to their consumption of dutiable merchandise, with capital left largely intact from all contribution whatever.

Labor keeps up the world over, while capital shrinks in its nominal income; it is to shield their capital and avoid this law of depreciation that they insist upon keeping up this extreme system. The tendency of the times is to lower values, the fruition alike of cheap capital and the inventive skill of man; labor is a living resource the world over; the few accumulate while the many merely gain a livelihood, and employment to our town and city population is as essential to insure law and order as to their health and subsistence.

To the laborer this is indeed a land of promise; our lands, to be had almost for the asking, are opened up to him by unequaled inland rail and water communications, making the field for labor almost boundless for generations yet to come, and labor will take care of itself.

So long as three-fifths of our population are engaged in agriculture, the value of their labor must largely gauge that of the other two-fifths, and this law of equalization must have its force. There is a nominal and a real value to labor; the latter being its purchasable power over the necessities, comforts, and luxuries of life. Reduce both in the same ratio, and their fruits of labor remain the same. We have cheap and abundant capital, and unsurpassed mechanical skill; what you want is cheap raw material and living, and labor in a measure to correspond; and but give the New England manufacturer these conditions, and her valleys and plains will preserve continuously her present, if not an accumulative, activity, with a command of the markets of the world for her products. As a nation and a people we are not in the infancy of our development and growth; we have the accumulative wealth, the manufacturing skill of the old world, and exceed them all in mechanical devices; what we want is not the paternal care of government, but a fixed policy more in keeping with the laws of political economy, tending to a reduced cost of manufactured products, that they may flow outward from us, and be consumed by other nations than our own. It is a question of employment and subsistence to over fifty millions, especially so to our city population; we must make the less advanced nations tributary to us by manufacturing more for them, as England, Germany, and France do, while the latter consume our surplus farming products.

As a rule, your city population is fixed and less migratory than our more rural people, and our limitless territories attract comparatively few from these classes, and the question of employment to these millions, in the near future, is far more vital than the rate of wages.

This policy of extreme protection, so at variance with all principles of equitable administration and of sound economy, not only affects the farmer disastrously but the commercial interests of the country also, and is a standing injustice to the masses of Europe who consume so largely our surplus products. Its injustice is not its only obnoxious feature or fruit; it is largely the source and foundation of the general demoralization in politics. Your successful millionaire manufacturers have entered political life largely by force of their money, and when in Congress, to perpetuate this system, every device to spend the public money is encouraged, either directly or tacitly, from the "arrears of pensions bill" to the "river and harbor appropriation."

In seeking redress for the evils of life I would not be rash and radical; take this tariff as it stands to-day and its extreme features should be gradually ameliorated. Its general average is about 45 per cent.; it is in fact what its friends have made it.

Now reduce it by 10 per cent., to take effect June 1 next, and at the expiration of two years 10 per cent. more—the reduction to be permanent until a general revision could be reached—thus leaving its average over 35 per cent. This seems the only practical way of adjustment at present; it is summary, but public sentiment demands it, and your protective features are only modified and not abolished. This reduction would not only tend to lower values more in keeping with the price of labor and of capital, but might favor a more healthy competition to the detriment of shoddy fabrics. It would pave the way to that scale of values in all merchandise favorable alike to the consumer at home and abroad, and lead to increased commercial intercourse with the outside world, thus augmenting the balance of trade in our favor. I am not so easily flattered with a tariff levying duties on Canadian grain and live animals which results in shutting them off from our lines of transportation and driving them down the Saint Lawrence to their ultimate markets as a part of the great agricultural surplus of the continent. Neither have I become enamored of your duties on wool, the chief fruit of which crops out in an enormous production of shoddy fabrics, enshrouding the whole American people in their deceptive embraces, as cold as the hearts that made them, leaving my wool on the market a beggar at the lowest rates of the last forty years.

Many of our American manufacturers are honorable producers of their varied fabrics, creditably emulous to excel in the quality of their productions, gaining thereby a reputation equivalent to and becoming a part of their capital. On the other hand too many have gone into shoddy productions; not content to make a genuine article so amply provided for by your liberal tariff margins, they have flooded our markets with their deceptive fabrics and adulterated products, so that most of us know not what we eat, drink, or wear. To remedy this, reduce your tariff; scale down this barrier to freedom of trade, giving us a more healthy competition—throwing this class of producers more upon their merits and their reputations.

As a farmer while the price of my products might be somewhat lower in keeping with our immense agricultural resources, I should in return for my productions buy at less rates my family and farming supplies.

There is no natural antagonism between capital and labor; not only are they mutually dependent, but mutually beneficent each to the other.

Labor gives to capital an enhanced value, and capital in its turn not only adds to the efficiency of labor, but increases its reward also. There is an equalizing tendency to values the world over, and in the long run natural forces must be felt.

Let us eliminate ourselves from the hodge-podge of political fallacies enveloping us, and let in the clear light of truth. And why not make capital contribute more directly to your treasury resources by a general income tax, predicated upon the cumulative surplus resources of the individual. Its possessor is largely indebted to labor for it, either directly or indirectly; he may have caught it on the wing as it were, by his manipulations and sharp practices, Jay Gould like—or otherwise it has come largely by the appreciation of values incident to all new countries, the resultant fruition of the care, the toil, and travail of all for the last hundred years. Relax the burdens of government taxation upon labor and place them more upon capital, assert the principle that a man's necessary living resources should in a measure be exempt from taxation, and the burdens of government be placed more upon the surplus means of the individual, and you at once open up the way for a more healthy prosperity national-wise and place labor with its products more in keeping with the value of capital here, and the general price of commodities in other countries.

The English merchantman goes out to all the ports of the world loaded down with every species of human product, and returns with the selected productions of other climes, for consumption at home, either as food or raw material, or again to be re-exported to other lands having less commercial facilities than her own. Hence her successful commerce, her vast mercantile marine.

We are shut out from these markets by our higher-priced fabrics, and our vessels go out half-loaded with our more crude products, and your own commerce languishes with your merchant marine almost banished from the ocean. And why should the policy of government be inspired by this one interest at the expense of all others.

During our civil war the East was largely devoted to manufacturing, while the West was almost exclusively agricultural, and it was largely due to the brave adventurous spirit of our more Western soldiers that success finally crowned our arms. Later still, years after the war, while struggling along in doubt and despair with our depreciated currency, it was our immense agricultural surplus, wrenched from the soil by these same hard-handed, self-sacrificing yeomanry of the West, that turned the balance of foreign trade in our favor, enabling us to resume specie payments, while these same aristocratic bounty-loving manufacturers scarcely furnished a bagatelle of their products for export.

This condition of things is inimical to the spirit of our institutions, as well as adverse to the laboring masses. The resources of government coming largely from your levy on importations, not only increases their cost to the consumer, but also the cost of all similar home productions without further compensation than a mere nominal increase of wages. You not only favor capital engaged in these interests, but leave all capital intact and largely exempt from all contributions to the general burdens, thus favoring the accumulation of large estates, leaving labor in the future at the mercy of monopolists, with little chance to rise. You shut out the raw materials of other nations to the prejudice of our ocean marine, leaving us for our exportation largely only our more crude productions, reversing in this respect the policy of our more enlightened European competitors. Your cotton and tobacco, your grain and other food products, exhaust our soils of vital principles, the cream

of their fertility that cannot be returned to them when consumed abroad, and the débris, the excrement from their consumption, goes to enrich the lands of Europe under their more careful system of husbandry. It is only seventy-five years since the center of wheat production was upon the banks of the Hudson; it has already reached the basin of the Upper Mississippi, leaving behind the old States, largely exhausted of their wheat-growing capacity; and so of cotton also.

Aside from this, I have shown an advanced condition of things to the general farmer, inimical to the keeping up and improvement of the soil. We are comparatively a new country; but already the old States have lost their virgin fertility, and nearly one-half of these lands are scarcely worth the owning.

I have always looked upon our vast Western areas as largely the living resources of future generations, rather than of our own, and that the policy of opening them up so rapidly to our exhaustive system of husbandry was all wrong. We must have something besides these crude products to meet our balance of trade with Europe: we must fabricate for others than ourselves. The crisis is already upon us, the balance for the year ending September 1st, when compared with that of '81, being adverse to us by \$150,000,000 nearly, leaving out of the count the precious metals. As a New Englander, I wish to see the basis of her prosperity established on a more enduring basis; in capital, skill, and resources she is prepared for the emergency that is upon us, but give her the opportunity and she will furnish her share in exportable resources to turn this overwhelming tide against us.

You would naturally expect that interests so long petted would be able to stand alone; undoubtedly most of them are, and all should be; but this system of favoritism is adverse to economical production; extreme profits leads to extravagance of management; joint-stock corporations with their watered stock and innumerable official positions for the whole family circle. Instead of reserving their extreme profits to tide them through adverse times, they have either been distributed in lavish dividends or perhaps been diverted to other plants, or else absorbed by a consolidation with kindred interests of doubtful value, the minor stock interest being at the mercy of the major one.

There seems a community of interest and ways among our railroad and manufacturing magnates, and all their devices are largely, either for the concealment of their profits, or for the perpetuation of their monopoly at the expense of the people at large.

Now, would the manufacturer suffer especially, would your more inland Western one suffer from this reduction with a long inland line of transportation in their favor, with all their accumulated resources to sustain them? All other capital commands reduced rates, and why not this; money yielding only about half its former return. Why not place a barrier on foreign capital as well as on foreign products, or so adjust matters that people of reduced incomes shall command their necessities at reduced rates also.

If you are going to regulate and protect one interest at the expense of all others, why not equalize the damage? Better, far better, confine yourselves to your legitimate constitutional duties; let all quackery go by the board, and leave labor, capital, and interests to adjust themselves as the laws of trade demand. In the long run individual and national prosperity lie in this direction. The motto is as pertinent to the government as to individuals: "Mind your own business and leave others to care for theirs."

OTTO GERDAU.

NEW YORK, *October 4, 1882.*

Mr. OTTO GERDAU, of New York, importer of ivory, submitted the following statement:

GENTLEMEN: I beg leave to call your attention to the excessive duty levied under the existing tariff upon piano and organ ivory and chair cane.

In 1872 a very old established Hamburg ivory firm sent your present petitioner to America with a stock of piano and organ ivory. I found the ivory a strict monopoly of three Connecticut firms, these in turn depending upon Messrs. Arnold, Hines & Co., raw ivory importers. The piano and organ manufacturers of this country were very glad at my advent as a relief from a severe oppression, and in less than two weeks I had sold at an enormous profit a stock which I had thought would have lasted at least five months. As I then continued to import, the combination of three was broken up and began quarreling among themselves, and at last Messrs. Arnold, Hines & Co. were instrumental in closing up one factory, leaving two in the field. Prior to this Messrs. Arnold, Hines & Co. endeavored to stop my importations through statements in the custom-house that my goods were undervalued, but as these allegations were proven to be false in every instance, I suffered from them no further injury than a good deal of annoyance and worry.

At the present time, then, there are in the whole of America only two factories cutting piano and organ ivory, and these two are controlled more or less by Arnold, Hines & Co., shareholders in one and suppliers of raw ivory to both. These two factories, simply by abstaining from charging the former outrageous profit, have again succeeded in creating of the trade a strict monopoly, because at 35 per cent. duty a fair competition is indeed impossible. As a proof of this I need but mention that, as far as I know, not one other piano and organ ivory manufacturer of the whole world exports now one pound to America, and the one Hamburg house has taken into consideration the withdrawal of their agency. A member of one of the Connecticut factories in a casual conversation informed me that a set of ivory costing on the average \$7 cost here to cut and bleach ready for sale not more than 50 cents for labor, and at a glance, then, the excessiveness of 35 per cent. duty will be apparent to you.

In order that all the American consumers shall not be at the mercy of two combined concerns, in order to allow a fair competition, I petition that the duty on piano and organ ivory be reduced to 10 or 15 per cent. At that grade billiard balls, which are now assessed at 50 per cent., will still be absolutely excluded, they in fact not being able to stand 5 per cent., as an investigation on your part will prove; but this article is at least not one of monopoly, and, being turned here about as cheap as in Europe, nobody thinks of importing them.

CHAIR CANE.—This article is manufactured here under fully as strict a monopoly. Four or five concerns, sure that no effectual competition can be made with them, have combined, and about dictate to the chair manufacturers their terms, and will; and, if a petition for a change, signed by every chair-maker of the Union, is desirous, I think I would not be given a refusal from any. The duty on it now is 25 per cent., and

that not more than a fair competition will be created by taking it off entirely is evident from the fact that one manufacturer exports to Europe about as much, or more, than Europe sends to America.

Your honorable Commission has entered into such a thorough investigation looking to a reform of the existing tariff, that I believe the attention given to articles of far greater importance will not prevent justice being done to piano and organ ivory and chair cane. I advocate the levying of a duty of 10 to 15 per cent. on the former and free entrance to the latter.

By Commissioner McMAHON:

Question. You have to pay a duty of 35 per cent. on piano-forte ivory, and you advocate a reduction of duty to 10 or 15 per cent.?—Answer. Yes.

Q. Are you a manufacturer as well as an importer?—A. I am an importer only; we only manufacture on the other side.

Q. The ivory from which this is made is imported free of duty?—A. Yes.

Q. And you think that 35 per cent. is too much of a difference between the raw material and the manufactured article?—A. Yes; it is too much protection to the American manufacturer.

Q. Would that be true of a more finished article of ivory?—A. No. I think that there are some fancy goods of ivory which would stand a duty of 35 per cent.

Q. Are you also an importer of chair cane?—A. Yes.

Q. And you make the same point, that the difference between the raw cane, which is admitted free of duty, and the strip or chair cane, is too great; that there is too much protection to the American manufacturer?—A. Yes.

HENRY T. COATES ET ALS.

NEW YORK, *October 4, 1882.*

The following communication from Mr. HENRY T. COATES and others, of Philadelphia, in regard to the duty on books, was ordered to be printed :

To the honorable the Tariff Commission :

In response to the request of the Commission for information regarding the various branches of industry affected by the tariff, the undersigned committee, appointed by the Book Trade Association of Philadelphia, would call your attention to the absolute necessity not only of the protection already afforded but of measures to prevent a system of undervaluation that has for many years operated against the business of the manufacture of books in all its branches in this country.

Already it is a question with some of the largest publishing houses whether it would not be to their interest to manufacture American books by American authors in England or on the Continent, and unless a remedy can be found for the undervaluation of which we complain our paper-mills, printing-offices, and book-binderies will be comparatively idle, while almost every other branch of industry in our country exhibits activity and increase. To bring about a more healthy condition, we would, therefore, call your attention to the desirability of changing the existing ad valorem duties to commensurate specific duties; a change which could work no harm to the honest importer, and would protect him from his unscrupulous competitor.

From the peculiar nature of the publishing business, books are among the most difficult articles of which to determine the market value; and hence the opportunity for undervaluation to evade ad valorem duties is very great. It is practically impossible for any official, however careful and competent, to be conversant with the prices of the thousands of books that in a single year are put on the market, let alone the productions of previous years, or of the reductions and increase of price attending the production of successive editions of the same book. There are many elements which enter into the manufacture of a book that make it cost a great deal or very little—elements that it is impossible for any one save the manufacturer to be aware of. The edition may be small, or it may be large; it may be printed from plates, or from type. The rate of copy-money paid to the author is also variable, and often differs for home or foreign markets; and many other circumstances, too numerous to occupy your valuable time in stating at present, would seem to render the market value of books more difficult to determine than that of any other article. The undervaluation, however, is easy. For instance, a foreign publisher, who has on hand the stereotype plates necessary for the production of a particular book, after having manufactured a sufficient number for his own market, will print an additional number for the American market, and invoice them to his agent here (whose profits he possibly shares) at a merely nominal figure—the bare cost of paper and of printing. Nothing is added for type-setting, for cuts, or for editorial labor. The price in reality is only a portion of the actual cost of producing the book, although it is the rate at which it is invoiced and imported, and is considered and often accepted as the

market price. Not only is the government by this means defrauded, but the importer can well afford to pay the twenty-five per cent. ad valorem on this low rate, and then drive from our market competing American books, to the detriment of American authors and American labor, for the fostering and protection of which the import duty is imposed.

As representing the principal branches of trade connected with book manufacture in the city of Philadelphia, we trust that, in the revision of the tariff, some effective protection will be extended to these important interests. Experience has shown that a simple ad valorem duty affords so many opportunities of defrauding the revenue, especially when foreign manufacturers establish their agents in this country, that we hope you will see the wisdom of changing it for a specific rate. We annex a memorandum of what we think would prove a satisfactory adjustment, protecting the manufacturing interest without bearing heavily on scholars and scientific men who may require works in foreign languages and old books. The tariff of 1842 and the English tariff formerly levied duties on books by the pound weight, and results have shown that the plan works well.

We therefore are of the opinion that it is only by specific duties that proper protection can be afforded and the interests of the revenue guarded.

SUGGESTIONS FOR A TARIFF ON BOOKS.

On all books, periodicals, pamphlets, photograph albums, blank-books, bound or unbound, and all printed matter, engravings, bound or unbound, illustrated books and papers, and maps and charts, 20 cents per pound weight

The free list to remain as it now stands.

On all stereotyped or electrotyped plates and casts of wood-cuts a duty of 20 cents per pound weight.

Asking your attention to these suggestions, we have the honor to remain,

Very respectfully,

HENRY T. COATES.
GEORGE R. FAGAN.
JOSHUA R. JONES.
ROBERT S. MENAMIN.
CHRISTIAN C. FEBIGER.

LEWIS T. HAWLEY.

NEW YORK, *October 4, 1882.*

MR. LEWIS T. HAWLEY, of Syracuse, N. Y., farmer and owner of salt stock, made an argument in favor of the maintenance of the existing duty on salt. He said:

I take it for granted that any remarks which I make are not made with any view of enlightening this intelligent body. In my opinion labor is the source of wealth. Wealth is the product of labor. This city, its streets, its buildings, its mercantile and manufacturing industries, are all the product of labor. I need not enlarge upon that idea. I think we all understand that. But I wish to say a word, for instance, about farming. There has been so much said about the suffering of the farmer under the tariff that I have sometimes felt disgusted. I take the ground, as I suppose you all do, that supply and demand regulate the prices of things, naturally, if not interfered with by panics. Naturally supply and demand must regulate prices. If we were destitute of manufacturing industries in the United States we would be still as at the time when cotton cloth cost 50 cents a yard in this country, and salt cost from \$4 to \$5 a barrel. That was before we went into the business of making cotton or salt.

As you are all aware, Syracuse is next door to the eastern seaboard, and if war should come upon us while our salt industry was crippled by low duty or free trade the country would undoubtedly suffer very seriously. Therefore I think it is well to build up and protect that interest instead of injuring it. I think that any nation that will trust to have its manufacturing done in foreign countries, thereby transfers to those foreign countries the building of its towns and cities and railroads, and the carrying trade of its raw materials. I think that every country should be independent; should manufacture its own goods, build up its own railroads, and give to its own people employment and good wages. I hold that it is very immaterial, for instance, about the prices you pay provided you are all equally protected. Equal protection is what we need. When every manufacturing industry in the United States shall have learned to stand shoulder to shoulder, and shall suffer none to be subjected to free trade, then we shall have arrived at the millenium of prosperity.

I have a short paper which I wish to lay before you, prepared by a committee on the part of the salt producers of Onondaga County, because I did not come here expecting to make a speech. It is as follows:

GENTLEMEN: In your investigations in the matters of tariff, we suppose that, based upon your report, the questions are to be settled by Congress how much tariff or imposition of duties shall be placed upon imported articles; whether the imposition shall be controlled by the simple needs of government for the financial support, or to such an extent as to protect and foster, within reasonable bounds, the industry of its own people. Your duty, as we understand, stops short of any determination of these questions, and is confined to examinations in detail of the various prominent industries of the country, such as the volume and extent of each, cost of production and transportation to market, cost of sale, and price received as contrasted with the same charges or cost of the like imported productions.

So far as our industry—the manufacture of salt in its various forms

—is in this connection concerned, we have appended hereto tables giving correct data of the average cost to us, in detail, of production, transportation, and sale, and also the reported cost of the manufacture of English salt, its transportation to and handling in our markets. We confine our tables in the main to the English salt and its transportation to our point of competition and common market, to wit, the seaboard, for, although costing more than any other imported salt, it comes more directly in competition with our industry.

Our tables in reference to English salt are the work of a large English salt manufacturer, and are wholly reliable. One item of our costs is called a *duty* imposed by the State of 1 cent per bushel of 56 pounds. The reason for this is, first, that by purchase from the Indians the fee of the land and the royalty of the water is in the State; and, second, to give equal advantage to all manufacturers, the land free of other rent is furnished, the wells sunk, the water raised and placed in reservoir and thence distributed by the State, by whose officers it is inspected as to quality and quantity, thus leaving but a meager margin yearly to the State treasury for its rent of the land and royalty of the water; the individual manufacturer, however, is called upon to pay all other expenses.

These tables tell you practically all there is of our case, but we trust that we may be indulged in expressing some views which we entertain.

First. We are in favor of *protection* to all American industries which come in contact with foreign production, whenever America is largely in possession of the raw material out of which to produce the manufactured article.

Second. Protection should be measured by the difference in the value of labor. We include in this both the original cost of the manufacture in all the bearings that labor has upon it and the charge for handling and transportation; if anything beyond this, it should be a small increase as an inducement for the establishment of home industries. We therefore think that, by an examination and comparison of the tables below, our request for an increase of the present duty on salt from 8 cents per 100 pounds loose, and 12 cents for the same amount in packages, to 12½ cents on the first and 24 on the last, would no more than carry out a policy of protection in our case.

The reason for the difference asked between salt in bulk and the same in packages is that the higher quality and greater cost of the latter, together with its package, is but simply met by this discrimination.

If revenue is an object, and that we have a right to believe is intended, permit us to state that under the tariff of 1865 the amount of salt imported in 1880-'81 would have paid a revenue to the government—

On packages of.....	\$962,329 10
On salt in bulk.....	869,539 02
Total	1,771,868 12
Under existing tariff salt in packages	481,164 55
Under existing tariff salt in bulk	359,795 12
Total	840,959 67
Loss in revenue	950,008 45

And we say without fear of contradiction that the average price of foreign salt has been very near if not quite as high for the past eight years as the eight years preceding, except that sharp competition in England has depressed the Ashton, but at the same time the price of its home competitors has at least been correspondingly enhanced.

Prior to 1874 the duties on salt in the forms above mentioned were respectively 18 and 24 cents; at that time we had more than twice the

number of salt works and operatives that we now have, and the value of plants has at least shrunk to one-third of its then value, and we can with truth attribute the larger share of decrease in both value and production to the lowering of the customs duties.

We desire to call your attention to one fact in the workings of the present system which should be remedied:

At the expense of one American industry, ostensibly for the benefit of another, all salt used in ocean fishing and imported was made and is free of duty. What has been the result? As it appears from government returns the amount of salt thus made free was in 1881 2,238,254 bushels, while the amount actually used for curing fish was 1,363,203 bushels, thus avoiding the payment of \$45,000 on the balance, 1,017,551 bushels, which was thus thrown into the general market, not only in violation of law, but in direct competition with our own product. Again, our lake and river fisheries, almost if not quite as extensive as those of the ocean, have no such privilege. Would it not be far better to abolish this discrimination, and require each home industry to live and act under equal laws?

All American industries add to the material wealth and prosperity of the country, but we have a salient fact in the history of the Onondaga salt manufacture which is of sufficient importance to be particularly mentioned. When the plan of building its canals was wisely adopted by our State, a way was sought out to relieve the State from taxation on their account. To that end, among other things, the legislature first, and the people shortly after, by organic law, raised the charge for the use of our salines to 12½ cents per bushel, and solemnly pledged the faith of the State to apply the moneys to the payment of the canal debt, and also agreed that the duties should not be altered until the last dollar of the debt was paid. When in 1834 this end was accomplished, it was found that the Onondaga Salt Springs had paid of such indebtedness about one-third of the whole, or the sum of over \$2,300,000.

While it is unnecessary to recite what the Erie Canal has accomplished, we ask you to reflect how much the great States of the West and Northwest owe to the early accomplishment of that great enterprise. It was the salt of the Onondaga Valley and not the productions of foreign countries which early opened up the rich lands of that great territory and continues to offer them as the homes of millions of men seeking from all countries, where great numbers and unremunerative labor will neither permit the education of the children nor furnish the actual necessities of life to their families, the means to support life, secure education, and give as the reward of honest labor an abundant living for the present and a reasonable hope for social and financial advancement in the future.

We again call attention to the accompanying tables, and respectfully request that with other American industries our manufacture may receive that care and protection which whenever exercised in the past has inured to the great prosperity of our country, while an occasional opposite policy, history says, has materially retarded our great advancement as a nation.

Cost of putting same on vessel.....	0. 0161
	0. 0365
English salt, f. o. b. vessel, Liverpool costs.....	0. 0365

Cost of English salt in our ports.

Ocean freights on salt from nothing or ballast to 12 shillings per ton of 2,240 pounds:

	Shillings per ton.
Falk's report gives, for 1880, average Liverpool to Boston.....	3
Liverpool to New York.....	7½
Liverpool to Baltimore.....	7
Liverpool to Charleston and Savannah.....	5
Liverpool to New Orleans.....	6

Cost of English salt afloat.

These freights added to cost of English salt, f. o. b. vessel, Liverpool, result in following cost prices of salt afloat at following points:

	Per bushel, 56 pounds.
In Boston.....	\$0. 0535
In New York.....	0. 0787
In Baltimore.....	0. 0765
In Charleston.....	0. 0645
In Savannah.....	0. 0645
In New Orleans.....	0. 0705

Cost of English salt, with duty added.

If, to the above prices, the present duty 0.0448 per bushel be added, the resulting prices are as follows:

	Per bushel, 56 pounds.
In Boston.....	\$0. 0983
In New York.....	0. 1271
In Baltimore.....	0. 1249
In Charleston and Savannah.....	0. 1129
In New Orleans.....	0. 1189

Cost of Onondaga salt at Atlantic ports.

Transportation from works to New York, Boston, and our North Atlantic ports averages 5 cents per bushel, which, added to cost of salt at our works, gives cost of our salt at above-named points, as follows:

	Cents per bushel.
Solar salt.....	18
Fine or boiled salt.....	16½
F. F. dairy salt.....	24½

While at Philadelphia, Baltimore, and our South Atlantic ports the cost is fully 3 cents more per bushel than in New York City.

Comparative statement.

Showing cost of English salt under the tariff which we propose, 7 cents per bushel, compared with cost of our salt in general use at points named, per bushel.

	English salt.	Onondaga salt.
At Boston.....	\$0 1235	\$0 165
At New York.....	0 1487	0 165

E. D. MORGAN & CO.

NEW YORK, *October 4, 1882.*

The following communication from Messrs. E. D. MORGAN & Co., of New York, in regard to the duty on sugar, was ordered to be printed:

We have read the statement of Danford Knowlton, esq., made to the Commission in regard to sugar, and we beg to say that we concur in the views expressed by him as to the best method for the collection of revenue on sugars, viz, by the use of the polariscope; and we would add that we have found the government tests (under Secretary Sherman's circular order) of our importations were almost identically the same as those made by our own testers.

The existing tariff works great injustice to the great mass of the sugar producers of the world, inasmuch as it discriminates against all low grades, and in favor of the higher grades; the use of the polariscope as suggested by Mr. Knowlton would place all grades of sugar on a parity, and would greatly benefit consumers and refiners, and at the same time would incidentally afford better protection to the producers of sugar in this country.

TRUSLOW & CO.

NEW YORK, *October 4, 1882.*

The following communication from Messrs. TRUSLOW & Co., of New York, in regard to the duty on corks and cork bark, was read and ordered to be printed:

On behalf of the cork manufacturers of the United States, we beg to submit a statement in relation to the tariff on corks and corkwood.

The present tariff reads:

On "corks and cork bark, manufactured, 30 per cent."

On "cork bark or wood, unmanufactured, free."

The undersigned, manufacturers of corks and importers of cork wood, respectfully suggest to your honorable Commission a change of the existing duty on "manufactured corks" from 30 per cent. ad valorem to \$25 per 100 pounds specific, and that cork bark be permitted to remain duty free, as at present.

The change in the duty on manufactured corks we desire for the following reasons:

First. That it will give better and needed protection to our American factories, not only under existing conditions, but particularly in view of increased foreign competition expected in the near future.

Secondly. That a change from an ad valorem to a specific duty will prevent fraud in the undervaluation of invoices, which at the present time may exist, greatly to the disadvantage of the honest importer.

In further explanation, we submit the following particulars and information:

A change in the duty from 30 per cent. ad valorem to \$25 per 100 pounds specific will result in an increased rate of duty on some kinds of corks, and in a decreased rate on other kinds, governed by the relation of weight to quality.

The decreased rate will obtain on that class of foreign corks which can be used to best advantage in this country, and against which the American manufacturer may not compete, owing to circumstances beyond control.

We cite for example "champagne corks"; owing to the difficulty of obtaining cork wood suitable for making these corks, and for other sufficient reasons peculiar to the trade, their manufacture, irrespective of cost, is impracticable in this country. On these goods we believe it would be desirable to reduce the rate of duty, and this reduction would be accomplished under the tariff advocated by us.

On certain other kinds of corks, "wine corks and beer corks," for example, the American manufacturer requires increased protection in order to compete with foreign corks of this class, and such protection, to the extent of perhaps 10 per cent. to 15 per cent., would be secured by the change suggested.

Foreign corks have, until very recently, been manufactured entirely by hand labor. To Americans belongs the credit of having first invented machinery applicable to this purpose.

The increased and growing importance of the cork-manufacturing industry attained during the last few years has been reached through the means of American machinery. Our machinery has recently been introduced abroad, and at no distant date will probably be employed in

Spain. Against the combined competition of our own machinery and Spanish cheap labor, we certainly find a sufficient cause for asking protection.

The duty we propose is certainly not oppressive, nor can it operate to discourage any existing home industry. No objection, so far as we are informed, to the present or to any moderate duty on corks, has ever been formulated by the consumers of these goods. A reduction in the duty has been agitated only by a few small importers of foreign corks, who naturally desire to encourage their business relations with Spanish manufacturers.

A bottle of American champagne is worth, say, at wholesale, \$1.25; the duty on the cork would be about one-third of one cent.

A bottle of wine is worth from 50 cents to \$1.50 at wholesale; the duty on the cork would be from one-eighth to one-tenth of one cent. The best and most expensive corks are generally used for bottling champagne, wine, beer, and mineral waters, all of which may be considered luxuries and legitimately taxable. The value of the cork in relation to the value of the package is infinitesimal.

Touching the relative merits of a specific versus an ad valorem duty on corks, we would say that it is a matter of great difficulty for any one other than an expert of long experience to estimate correctly the quality and relative value of corks. The consequent difficulty of intelligently appraising invoices leads, in the opinion of the undersigned, to frequent undervaluations.

Unscrupulous Spanish or Portuguese houses may thus send their goods to this country, with or without collusion, accompanied by invoices at less than the true value for entry at the custom-house; and against this species of fraud an ad valorem duty does not offer sufficient protection.

The industry of cork cutting in this country is comparatively of recent date. We compete with the cheapest kind of foreign labor. In addition to the large Spanish and Portuguese factories, paying their operatives less per week than an American operative commands per day, we have the competition of the Spanish peasantry. These people, frequently whole families, at seasons when not engaged in agriculture or other regular pursuits, devote themselves to cutting small parcels of cork bark into corks, and in the aggregate produce very large quantities; the bark is frequently obtained by them from the forest, in small lots, at no cost. The product of this irregular labor is bought by the foreign cork merchants at nominal prices, assorted, packed, and shipped to the United States or other foreign countries.

Notwithstanding the far greater cost of labor in this country, we have succeeded with American machinery in producing a cork much better than the foreign hand-cut cork; in respect that it is uniform in size, more regular in quality, and more finished in appearance, at a price which competes generally with the foreign hand-cut cork at present rate of duty. We have succeeded in rendering this country independent of foreign hand labor for its supply of manufactured corks, for which, a few years ago, we were entirely dependent on Spain and Portugal. We have established factories for cutting corks in all parts of the United States, from Maine to Louisiana, employing a capital of some millions of dollars and giving occupation to a large number of skilled operatives, one factory alone employing upwards of 500. The importation of cork wood for the year 1881 was between fifty and sixty thousand bales; the importation of manufactured corks during the same time amounted only to between 2,000 and 2,500 bales.

Cork wood, mostly produced in Spain and Portugal, has for several

years steadily appreciated in value, the consumption being greater than the supply. Notwithstanding this fact, American manufacturers, with improved machinery, are now supplying this country with manufactured corks of better quality than the foreign hand-cut corks, and at more or less the same prices that prevailed when cork wood was about one-half its present value. This is what American factories have done for the American consumer.

On the other hand, the foreign manufacturer, finding himself deprived of this market, has sought to regain his footing here by selling his goods at very low prices, sacrificing his former enormous profits. Owing to this competition, together with the natural home competition and the increased cost of raw material, the industry here is not now in a prosperous condition, and has failed for some time past to be reasonably remunerative for the capital invested.

Our manufacturers consequently feel discouraged, and should a decline in the industry follow, as a natural result the cost of corks to our consumers is sure to be enhanced by the foreign manufacturer advancing his prices as soon as our inability to supply the home demand is demonstrated.

With a moderate increase of duty, the American manufacturer will be encouraged to establish an increased plant of the best improved machinery, with better results to himself, and with the effect of preventing in the future a large increase in cost to the consumer.

A change in any other direction, either by placing a duty on cork wood or by decreasing the duty on manufactured corks would, we firmly believe, disastrously affect the industry in this country, unjustly entail upon the manufacturers a great loss in the value of their plant of expensive machinery, and would just so surely result in increasing the cost of corks to the consumer.

E. LAURENT.

NEW YORK, *October 4, 1882.*

The following communication from Mr. E. LAURENT, of New York, manufacturer of crochet buttons, in regard to the duty on buttons, was ordered to be printed:

I take the liberty to write you this letter, in the hope that should any change be made in the tariff, due attention should be paid to the unjust construction of the same in regard to "silk crochet covers for crochet buttons," which are entered at the custom-house as articles paying 10 per cent. duty instead of 60 per cent.

Also to beaded buttons, which only pay 30 per cent. duty, when beads pay more, (I believe 40 per cent).

I do not doubt that your Commission has already the above facts under consideration, as these questions have been many a time before the collector for many years, but could not be redressed.

The object of my letter is not only in regard to the above, but I would like also to say a word as to the rate of duty that I consider should be the fair rate imposed on hand-made goods, of whatever materials they are composed, when the labor comes in for 50, 75, and even 90 per cent. of the value, such as silk crochet buttons, gimp passementeries, crochet trimmings, passementeries, and ornaments, bead work, hand-made laces, &c.

All the above articles are articles of luxury, and can pay duty without the least inconvenience to those who consume the goods. They are all more or less being tried to be manufactured in this country, but are at such a disadvantage on account of the disproportion of the value of labor here, compared to European labor, that they cannot successfully compete with imported goods. Thousands of females would find a lucrative employment in those goods if they were protected by 75 per cent. not to say 100 per cent. duty. I say 75 or 100 per cent., and I do not exaggerate; for if you consider that broad silks, silk ribbons, or silk fringes, &c., where there is not more than 20 per cent. labor of its value, pays 60 per cent., and those goods are turned out quickly by machinery, why should silk crochet buttons, passementeries, laces, &c., which are all made by the hand, and with only the help of the needle, not pay 75 or 100 per cent. duty. The females I employ to make my goods have hard work to earn 50 to 75 cents a day (my work is all done at their homes), and in Europe such a work is made by hands who earn 25 to 30 cents.

Does this not strike you as a case to be looked into seriously? I, for my part, am not what would be called a protective-tariff man, for I think the more there is protection the more values will be inflated; but if there is a tariff which protects other goods, and therefore inflates values of the consuming laboring females, who need 75 cents a day or more for their daily work, they should be protected in their hand-made work in the proportion of its labor value. Everything cannot be made by machinery, and unfortunately the tariff has never been framed to cover hand-made goods, where the chief value is labor.

WILLIAM DEMUTH.

NEW YORK, *October 4, 1882.*

Mr. WILLIAM DEMUTH, of New York, pipe manufacturer, made the following statement:

I am a manufacturer and importer of pipes and smokers' articles. It would be for the interest and welfare of our business, as well as for that of our workmen, to have the tariff on smokers' articles left as it is. In case a change of duty should be contemplated we should like very much to appear before the Commission and prove why the change should not be made.

Commissioner AMBLER. We cannot tell you now what the Commission will do or will not do, and it will be quite impossible for us to give you a hearing at another time. If there is anything you desire to state you had better do so now; or, if you desire to put it in writing and submit it at your leisure, you may do so.

Mr. DEMUTH. Formerly there were no pipes whatever manufactured in this country; but, under the very high tariff of 75 per cent., the business was created, and it is now prosperous. There are over a thousand workmen employed in making pipes in this country. Formerly we imported all these goods, and now we import only about one-sixth part of the goods that are consumed here. The other five-sixths are made here. Strange as it may appear we can still import, under this high protective duty of 75 per cent., pipes much cheaper than we can make them. We have to pay to our workmen a dollar for every florin that is paid in Europe. A workman who gets 20 florins in Europe has to get \$20 here. They are all skilled workmen, and are very hard to get. They do not often emigrate unless they are tempted with very high wages, and it is a very hard thing to keep them here when they do come. So far as my own personal interest is concerned I could import all the goods I sell and be as well off as I was ten or fifteen years ago. I have no authority to speak for other manufacturers, but I believe that if the duty on pipes were reduced their factories would be at a standstill, and a thousand workmen would have nothing to do. The value of the pipes is in labor mostly, because the material is not of much value; and therefore the duty on pipes should be large. I admit that, in regard to meerschaum pipes, the protection is ample, because there the raw material is dear, and we make nearly every meerschaum pipe here, while the smaller meerschaum articles, like cigar-holders (where the labor is everything), it is impossible for us to make here. We therefore import every cigar-holder and mouth-piece because they can be made so much cheaper in Vienna than here. The tariff says, "on all pipes, 75 per cent. and \$1.50 a gross." Then it goes on to say, "on all clay pipes, common or white, 35 per cent." This classification has created a great deal of trouble. It is so hard to say what is common and what is white. There is no line to be drawn as to where the 35 per cent. ends and the 75 per cent. commences. Here is a pipe which pays 35 per cent. duty, but it is hardly ever imported. It is made here. This bowl [exhibiting] comes in under the clause of 75 per cent. and \$1.50 a gross. That, of course, we cannot import, and we make it here. The bowl is sold for 1 cent, and the duty is 75 per cent. and \$1.50 a gross. The Vienna manufacturers make these goods [specifying], but cannot make these other ones [specifying]. They

should pay the same tax. If it is the intention of the Commission to protect labor, it ought to recommend that both these pay 75 per cent. If not, the Commission should recommend that they both pay 35 per cent. At 35 per cent. duty they could not be made here, but at 75 per cent. they could be. This [exhibiting] is a specially imported article.

Commissioner OLIVER. If the duty was put at 50 per cent., could they be made here?

Mr. DEMUTH. No, because it is all labor. A duty of 75 per cent. would be a proper protection for the article. I have not a dollar of interest in any of these factories. I only plead for them, even without authority. It makes no difference to the poor man, because he will have to pay 1 cent for his pipe; it cannot be sold for less. But if the duty is fixed at 35 per cent. then the dealer will make more profit, and the consumer will get his pipe for 1 cent all the same.

Commissioner McMAHON. What is the price of that bowl?

Mr. DEMUTH. One cent. The pipes sell for 60 cents a hundred with stems.

Commissioner AMBLER. Are they any higher now than they were before the tariff?

Mr. DEMUTH. No; about the same. The competition cuts the price down to 60 cents a hundred with a reed stem. That is the regular selling price to the cigar stores, so that they can retail them for 1 cent.

Commissioner AMBLER. Then the actual protection on this article would be about 175 per cent.?

Mr. DEMUTH. More than that.

Commissioner GARLAND. What is the actual cost of making these pipes?

Mr. DEMUTH. About 45 cents a hundred; the manufacturer sells them to us for 50 cents, the box containing a hundred. As I said, the government has much trouble in drawing the line as to what is a common pipe; if the pipe is a little figured and painted the custom-house officers say that it is not common, but if it is figured without being painted then they say that it is common; the line cannot be drawn. I should like to suggest some changes in the custom-house system.

Commissioner McMAHON. You had better submit them in writing.

Mr. DEMUTH. I would propose that an importer be allowed to make his affidavit through a notary, instead of being compelled to go to the custom-house himself and spending almost an hour every day of his valuable time there. I believe that the oath before a notary is as good as if taken by a collector or any one else. That change would be a great convenience to our merchants who have, in the midst of their business, to go down to the custom-house personally, and are not allowed to send a substitute. As I am all alone in business I have to go to the custom-house and swear to an entry, and the next day I have to do the same thing over again, and so on. Another suggestion which I would like to make is either that the importer be compelled to add all his charges to the invoices, or that the duties on those charges be abolished entirely. My own opinion is that the charges had better be left out. If the duties are to be laid on charges, then no entry should be allowed to pass unless the charges are added in Europe. Another thing that I want to say is that the oath which the foreign exporter signs is greatly disregarded. I know that by long experience. Our form of oath is not the form which they have in Europe, and they subscribe to it without knowing anything about it, or caring anything about it. I believe that our government can make an arrangement so as to compel the merchant in Europe to make his oath before a local magistrate in the proper form,

which the laws of that country prescribe. I believe only in such an oath, and in no other. After that oath is taken let it be certified to by a United States consul. I know of many instances where invoices were sent to us at an undervaluation, the people thinking that they were doing us a favor. They certainly did not think that they were doing any wrong. There are men in Europe of high standing who do this every day, but if they are required to go before one of their own magistrates and take an oath in their own form, this thing will cease.

Commissioner AMBLER. That is, you suggest that the oath shall be taken by a European magistrate and certified to by a United States consul?

Mr. DEMUTH. Yes; the merchants in Europe, who sign these papers, do not believe that they are swearing. Another reason why the duty on charges should be taken off is that if an importer imports his goods by slow freight he has, of course, less duty to pay than if he imports them by fast freight. And this on common goods would make a considerable difference.

Commissioner OLIVER. What is the average of charges on your line of goods abroad?

Mr. DEMUTH. At least 10 per cent. on common goods, and about 5 per cent. on finer goods.

Commissioner OLIVER. What commissions do you pay?

Mr. DEMUTH. From 2½ per cent. to 5 per cent., according to locality. In Vienna we pay 5 per cent. We have to pay that even if we do business directly with the manufacturer. In Paris we pay 2½ per cent. commission. As to this slow and fast freight, I believe that the importer would import just what he wants if he imported it by fast freight, but as he has to take slow freight he often imports more than he wants. We have to pay a duty of 75 per cent. on railroad freight that costs \$20, while by slow freight it would cost only \$5. Of course, that would make no difference if there were no duties or charges.

ROBERT DUNLAP.

NEW YORK, *October 4, 1882.*

Mr. ROBERT DUNLAP, of New York, manufacturer of hats, presented the following statement, being a copy of one submitted to the Committee on Ways and Means of the House of Representatives some time ago :

GENTLEMEN: In compliance with your request, we beg herewith to submit to your consideration a statement relating to hatters' black silk plush and silk-hat material, accompanying the same by samples.

Hatters' black silk plush is manufactured mostly in France, and to a small extent in Germany. Efforts have been made to produce it in England, but without success. The German article does not stand in high repute, and the greater proportion consumed throughout the world is manufactured by the three French houses, Messrs. J. B. Martin & Co., Tarare, France; Massing, Freres & Co., Puttelage, Lorraine; E. Huber & Co., Sarraguenienes, Lorraine.

In this country the manufacture of the article was started under most auspicious circumstances, such as abundant capital, experienced workmen, &c. But after a sacrifice of a large part of the money invested, the enterprise was relinquished, having failed from the same cause as in England, namely, the impossibility of producing the deep lustrous black, capable of standing, without changing, the intense heat to which the plush is subjected while being manufactured into hats. The quantity used is too limited to tempt capital to an enterprise so certain of failure, whilst other silk goods, used in almost unlimited quantities, can be produced without risk.

The import duty on hatters' plush was, prior to 1861, 18 per cent.; during the period of the war it was successively advanced to 30, 40, and 50 per cent. Under a false construction of the so-called "little tariff bill" of 1875, the duty on it of late has been 60 per cent.

Black silk plush for hatters' use is, in the full sense of the term, a raw material. In the state in which it is imported it is adapted to no other use whatever, and could be sold for no purpose but for that of being converted into silk hats. Piece silks, velvets, &c., can be used in many manufactures; hatters' plush, however, only for the one purpose for which it is originally designed. In most countries it is admitted free, or at a nominal duty.

Here, then, we have a strange anomaly of a once flourishing manufacturing interest almost crushed out by a government tax intended to foster home industry; hundreds of skilled artisans, men who have spent years in acquiring the proficiency required by their delicate trade, deprived of a livelihood, and the government itself, by the oppressiveness of the tax, deprived of the revenue that formerly accrued to it when the rate of duty was lighter—in a word, a home industry destroyed, no home industry promoted, and the government revenue cut off.

For the further information of your honorable committee, we beg to annex a statement based upon the quantity of material required for one dozen hats, showing in separate columns the foreign cost and the

duty, to illustrate how onerous the tax is upon our manufacturing interest.

Material.	Foreign cost.	Duty.	Tax.
Black silk plush	\$13 15	Per cent. 60	\$7 89
Silk band and binding, lining, &c	6 93	60	4 16

Thus showing, that at the present rate of duty, for every silk hat manufactured the government derives one dollar, and if plushes are admitted free the government would still receive 34 cents on each hat, derived from duties on materials other than silk plush.

We therefore earnestly and respectfully ask your honorable committee to bestow early, prompt, and serious attention upon this matter, and to afford us relief from the distress at present surrounding our manufacturing interest, and ask your honorable committee to place hatters' black silk plush upon the free list, or to report a bill fixing the import duty on hatters' plush at not over 10 per cent. ad valorem, firmly convinced that in affording us the relief prayed for, you will affect no other interest injuriously, but will augment the government revenue.

Very respectfully submitted to your honorable body for consideration, with hope of obtaining the needed relief.

EVAN MORRIS, Philadelphia,
ROBERT DUNLAP, New York,
MARCUS C. COOK, Boston,

Committee of the Silk Hat Manufacturers of the United States.

Mr. DUNLAP continued: We do not ask for a reduction on hat bands or bindings, or on anything else than hat silk plush. My experience justified me in saying to the Committee on Ways and Means that, if that were left open, many goods would be attempted to be imported under the head of hat plush. For that reason we are simply content to ask for a reduction on silk plush alone. I have with me all the materials that enter into the manufacture of hats, so that the Commission may see what we mean by silk plush. (Exhibiting and explaining many specimens to the Commission.)

By Commissioner GARLAND:

Question. Is silk plush ever made in this country?—Answer. There was an attempt to make it twenty years ago, but it was a failure.

Q. What was the difficulty?—A. They could not get it to stand the intense heat required to finish the hat. I presume that if any one wanted to take the risk, and to invest capital in it, the thing might be attempted now with better success than it was some years ago; but the quantity required is so limited that it would not tempt capital to enter into it at all.

Q. What are the components of it?—A. Principally silk and a little cotton in the back.

Q. What percentage of it is silk?—A. A large proportion of it; probably two-thirds.

Q. What other silk materials are used in the making of hats?—A. These (showing specimens) are for the lining of hats. They all pay a duty of 60 per cent.

Q. Are these other articles manufactured in this country?—A. I believe so, to a certain extent.

Q. You ask for no change on any of these articles except the plush?—A. Nothing but the plush, because I am satisfied that the change could not be made with safety to the government. This cannot be imported under any other head than that of silk plush, unless there is collusion between the importer and the examiner, because it is so distinct from any other plush. There is plenty of other plush manufactured in this country, such as mohair, &c.

Q. And this pays a duty of 60 per cent?—A. Yes.

Q. What would it be worth per yard?—A. (Exhibiting.) This piece cost \$4.90 per yard. A yard of plush would make about three hats. It is divided up—a different piece for the crown and a different piece for the brim.

Q. What would be the difference between the present retail price of hats and the price if hat plush were admitted at 10 per cent. instead of 60 per cent.?—A. It would make a difference of about 60 cents per hat if all the other materials were left as they are.

By Commissioner OLIVER:

Q. You have stated that the attempt to make silk plush in this country was a failure, and that none is now being made?—A. None for hatters' purposes.

Q. And therefore the duty on hatters' silk plush is a tax and not a duty?—A. It is nothing but a tax.

N. D. WHITE.

NEW YORK, *October 4, 1882.*

The following communication, from Mr. N. D. WHITE, treasurer of the Ashland Emery Company, of Perth Amboy, N. J., in regard to the duty on emery ore, was ordered to be printed:

The Ashland Emery Company of Perth Amboy, N. J., which is engaged in the business of importing and crushing Turkish emery ore, has the honor to present the following statement for the consideration of the Commission.

The emery business of this country has been for several years in a languishing state, and as one of the means towards bettering our condition, we seek to have the act imposing a duty on crude emery stone or ore repealed, and the duty on the imported manufactured emery collected as originally intended by act of Congress.

If the real intent of the law relating to the duty on manufactured emery was carried out, some relief might be felt in our competition with the European manufacturers of free emery.

The act reads, that crude ore shall pay \$6 per ton duty, that emery grain shall pay 2 cents per pound, and that manufactured, ground, or pulverized emery shall pay 1 cent per pound duty.

In the emery trade the only terms generally used when referring to the manufactured article, are grain and flour emery, and there can be no shadow of doubt that the intent of Congress was to make grain emery, which is the more valuable part of the product, pay the greater duty, that is, 2 cents per pound, and flour emery, which is of little value, pay 1 cent per pound duty; and yet grain emery is brought here from Europe, entered as manufactured or ground emery, and pays but 1 cent per pound duty.

The burden of the tax on the ore is greater than appears at first sight, for after crushing a ton of the crude ore, upon which we have paid full duty, we obtain but 65 or 70 per cent. of grain emery or salable goods, while what remains is almost worthless; we therefore take the ground, as already stated, that the act imposing a duty on the crude ore should be repealed, and the wording of the present schedule altered, so that the duty on the manufactured emery imported into the United States shall be collected as originally intended in the tariff schedule.

In conclusion we would say that pure emery ore is not one of the products of this country, and it therefore seems the more unjust to continue a tax on the raw material which we use, especially as our business is an important, and we may say necessary adjunct to some of the largest industries of the country, among which are the manufactures of hardware, of cutlery, and agricultural-implement makers.

BRUSTLEIN, SURY & CO.

NEW YORK, *October 4, 1882.*

The following communication from Messrs. BRUSTLEIN, SURY & Co., of New York, in regard to the duty on soluble oil, was ordered to be printed:

As manufacturers of soluble oil, we would respectfully call your attention to the disadvantages under which we labor, and also to the amount of duty the government loses, to which it is justly entitled, by reason of the importation of this article at a rate of duty much less than its constituent parts would pay.

Permit us to state that the manufacture of this important article in this country is almost entirely destroyed, and that of foreign countries stimulated, by allowing it to come in at a rate of duty so much less than that which applies to the materials of which it is composed.

Being soluble in water, it is used extensively in printing and dyeing, and is composed of castor and other oils (usually averaging 50 to 70 per cent. of the article), the remainder being oil of vitriol, aqua ammonia, and water. It is imported under various names, viz: Alizarine assistant, dye assistant, oleine, soap liquor (which is on the free list), soluble oil, Turkey red oil, paying but 20 per cent. duty ad valorem.

In 1881 there were imported into this country about 1,200,000 pounds, or some 150,000 gallons. The duty on the castor oil contained in this quantity (some 75,000 gallons), at the present tariff on castor oil (\$1 per gallon) would be \$75,000.

The duty actually paid was about \$9,600, thus depriving the government of some \$65,400 revenue, to which it was entitled, in addition to crushing the industry in this country, by thus protecting the foreign manufactures of this article at the expense of our domestic manufactures.

To remedy this evil we would respectfully advocate the adoption of the following clause in the tariff:

"That the article known as soluble oil, alizarino assistant, dye assistant, oleine, Turkey red oil, or any similar compounds, by whatever name they may be known, shall pay the following duty: 35 cents per gallon when containing 50 per cent. or less of castor oil and [or] other oils, and a pro rata increase when the percentage of oil in the compound is increased."

This percentage of oil can be very easily determined. We would call your attention specially to the sentence above "or by whatever name it shall be known," as it would be useless to provide for the above duty on the names of the article as mentioned above, as the foreign manufacturers would simply bring it into this country under some newly invented name, in order to avail themselves of the 20 per cent. ad valorem duty.

In order to prevent the future importation of this and similar articles by foreign manufacturers to the detriment and loss of the government and our domestic manufacturers, we would earnestly advocate the insertion after Schedule M of the following clause:

"Any non-enumerated articles, being composed wholly or in part of any articles embraced in Schedule M, shall pay the same rate of duty as is chargeable on that constituent part paying the highest duty."

NORMAN D. SAMPSON.

NEW YORK, *October 4, 1882.*

The following communication from Mr. NORMAN D. SAMPSON, of New York, in regard to the duties upon iron and steel, was ordered to be printed :

Permit me to call attention to some incongruities in the iron schedule of the act of June 22, 1874, Revised Statutes. I limit these comments to articles which are known in the mercantile world as manufactures of iron and steel, respectively, as the metal schedule includes both of these materials.

The practice at this port is to impose the highest rate of duty when doubt arises, throwing the cases into court for adjudication after the Secretary's decision is made, adverse to the importer's appeal. This is contrary to the spirit of the laws, to judicial decisions, and to department instructions. The tariff, in this and other similar schedules, treats, and is intended to treat, the named materials and specified articles, whether as bar, rod, band, hoop, scroll, sheet, angle, tee (T), plate, or other irons known by these names, in the condition in which they are prepared in the rolling mill for mercantile use.

Any subsequent adaptation of any one of these articles to a specific use in a machine shop, through the application of skilled mechanical labor, under the conditions in which that labor is applied, *i. e.*, engineer's drawings, peculiar machinery and tools, higher scale of wages, &c., constitute such manipulation a manufacture of the material treated.

It was the opinion of the late Judge Nelson (*vide* Blatchford's reports) that in cases of doubt as to construction of a statute it should be interpreted in favor of the importer (consumer), on whom the burden of taxation rests—good law, which the Attorney-General, in the elucidation of the principle of construction on an analogous subject, confirms, and which the Secretary adopted as a rule of action and so instructed collectors and approving officers. *Vide* section 2339, last two paragraphs. The orders are not observed.

Again, the department rules, in section 4455, that "it is a well-known principle of law that such a construction should, so far as is practicable, be given to a statute as will promote, rather than impair, the object for which the statute was enacted." Again, the department, on October 30, 1872, ruled that "tariff laws class articles according to their designation acquired by general use in commerce and trade." And further, "When *Congress*" (not the Secretary, collector, appraiser, or examiner,) "identifies an article by a given designation for revenue purposes, it must be treated as a distinct article, whether so known or not." I give the quotation entire for obvious reasons.

Again, in section 2485, paragraph 4, the department broadly states that "any attempt to correct alleged errors" (*i. e.*, to force a classification) "would be equivalent to the assumption of legislative powers."

And once more, the department ordered, on April 1, 1875 (and wisely), that in certain actions the appraiser is "to exercise the same freedom as would be exercised by a jury."

Here are explicit sailing directions (being on the ocean beach the metaphor is allowable) which, if followed, would save the department

an immense amount of correspondence, importers an immense deal of annoyance, loss of interest until refunds are made, &c. I regret to state that the practice is the reverse of instructions. I will exemplify the trouble to importers by citing four articles, on two of which the courts have ruled in favor of importers, yet the department refuses acquiescence, and in all the "manufacturing principle" is clear as the noonday sun.

Cotton ties.—The courts have ruled them to be dutiable as manufactures of iron at 35 per cent., and duties have been refunded from the assessed rate of 1½ cents per pound, yet the department decides that they are iron hoops, dutiable at the hoop-iron rate of 1½ cents. As there are some ninety patents (now all controlled by one man, I believe), it seems that the principle of a manufacturing process applied to the hoop iron, after it has left the rolling-mill and passed through the machine shop, could not be more clearly established. Yet the department has decided on all sides of this question, and the venerable examiner of metals at this port is almost wild at the fish and flesh position of the department on the subject.

Again, "corrugated roofing iron, galvanized," has been judicially decided to be a manufacture of iron, and *not* the sheet iron galvanized of the tariff, because the corrugation is done *after* the mercantile sheet-iron is made, followed by machine-shop work, *i. e.*, punching and fitting for instant use.

Black, corrugated roofing iron, made in precisely the same way and similarly prepared, has been ruled with the preceding as dutiable at the rate of 35 per cent., and reversed to 1½ cents per pound under the sheet-iron provision. And this in the face of judicial decisions of District Attorney Woodford's opinion specially asked for, and of department decision of October 28, 1857, on corrugated zinc, where the department sustained the opinion of the then collector, A. Schell, esq.—

That the "zinc in sheets," being subjected to an additional process of manufacture, the "corrugated zinc" of commerce thus prepared * * * is to be treated as a "manufacture of zinc," &c.

See decisions of March 10 and May 12, 1880.

Also, *channel, tank-plate, and other section irons*, after being made in mercantile form in the rolling mill, carried to the machine shop, patterned upon engineer's drawings and fitted for use, have been made dutiable as manufactures of iron, and this has been reversed to the schedule and higher rate for the rolling-mill product.

Steel blooms.—The term *bloom* is unknown to the tariff. Its original meaning or application was to the product of the *iron* bloomary forge. The *ingot* of the steel provision of the tariff is that form in which the steel under the Bessemer product is cast. The *steel bloom* is that article (in general) which has been cut from the ingot and hammered down to special dimensions for special purposes of use.

The department has vacillated between 2½ cents, the steel-bar rate of duty, 30 per cent. as an unenumerated manufacture of steel, and 45 per cent. as a manufacture of steel.

Under such a conflict of opinions, what living man knows how to conduct his business.

I cite these four articles to show the eccentricities in the applications of the tariff acts, by all officers of the government. If the experts here now in office were left untrammelled to exercise their heaven-derived common-sense, merchants would not complain. I question where you would find two more practical-minded men than the two examiners in the metal division (ninth) of the appraiser's office at this port.

From the foregoing and on all similar articles my judgment is, (and it is based on practical experience as an importer, manufacturer, and dealer in domestic productions as well,) that such a change in all the schedules as shall make the duties specific on all articles as they come from the mill, and ad valorem on all manufactures thereof, or partial processes of manufactures will simplify the collection of duties, disembarass all officers in the discharge of their duties, relieve the department of an immense amount of annoying correspondence, enable importers intelligently to conduct their business, and materially increase the revenues; and all this can be done without changing the existing ad valorem rates of duty.

When you consider that the machine-shop work adds 40 per cent. to the value of the material in its mercantile form as made at the rolling mill, you will see an eminent propriety in regarding all such processes as "manufactures," and a most decided impropriety in applying the specific duties to such articles in any case. I have no ax to grind in making these suggestions.

FINLAYSON, BONSFIELD & CO.

NEW YORK, *October 5, 1882.*

The following communication from Messrs. FINLAYSON, BONSFIELD & Co., of Grafton, Mass., manufacturers of linen thread, in regard to the duty on flax, was ordered to be printed:

The position of linen manufacturers in America in regard to their raw material is so different from what exists in other trades, that the question of the admission of flax free of duty may be considered from a point of view peculiar to itself.

We submit the following reasons for its admission free of duty:

1. Flax is not grown in America to any extent for textile manufacturing purposes. The bulk of it is produced only for the seed, the fiber being neglected or destroyed. There is none produced of a quality high enough for fine linen thread or yarns.

2. That the manufacturing of linen does not receive any encouragement by having raw material of sufficient quality grown on the spot as is the case with cotton; it would therefore not develop, but would cease to exist unless supplied with material from abroad.

3. The development of manufacturing is the only means of encouraging the production of superior flax. The market must be created for the agriculturist, or he will not attempt the growth of a crop requiring careful and skillful management.

4. The manufacturing of linen can best be encouraged by the introduction of the raw material, whether dressed or undressed, free of duty; and with this development the agriculturist will find a profitable market open to him.

5. A handsome profit could be realized, by proper treatment, out of straw now destroyed.

6. The quality of the fiber is so dependent on favorable conditions of soil, water, and climate that it is questionable if any one country can produce the entire range of qualities necessary for the manufacture of linen thread and fine linen.

7. Even under the most favorable circumstances, it must take many years before the best results could be obtained.

8. We must have quality at any cost.

For these reasons we submit that linen manufacturing in America can be best served and most materially developed by the admission, free of duty, of the raw material necessary for its existence, whether dressed or undressed.

To explain the extent of the variations in the quality of flax, we may state that it ranges in price from \$125 to \$750 per ton.

The influence of agencies entirely local on the quality of flax is evidenced by the effect of the water of the river Lys on the flax grown in Courtrai in Belgium. The fiber steeped in its water attains a quality and beauty which increase its value more than 25 per cent. over equally good straw grown in equally fertile soil in the north of France, not far from the neighborhood of this more favored district. There is no other place in Europe where such results can be obtained, and possibly there may not be in America water with these peculiar chemical properties.

These facts, together with the fact that the flax crop is so dependent on propitious weather, show that the linen-thread manufacturer (who requires nearly the entire before-mentioned range for selection of flax suited to his large range of numbers) cannot depend entirely on the crop produced by any one country. In some unpropitious seasons it is difficult to get flax good enough for some of our purposes at any price.

It is questionable if America, favored as she is, could produce the entire range, and it is certain that even under the most favorable circumstances her agriculturists could not attain the skill necessary for the production of the very high classes of flax for many years; nor would they attempt to do so without the pressure and incentive of a demand from factories established in the country, which, however, can only be built up meantime with imported flax, admitted without any restrictions of duty and charges.

Within two years we have established a factory for the manufacture of linen threads at Grafton, Mass., and are there making threads of a very superior quality, and we do not know of any flax grown in this country of a quality good enough for our purposes. We import our supplies. We maintain the quality of our threads, whatever the cost. If American flax can be produced good enough, it would be welcomed by manufacturers, and meet a ready sale at handsome prices, and no manufacturer here would buy flax in Europe through agents in a market quite beyond his control, if he could buy it here himself of equal quality. But if American flax be not good enough and is forced on the manufacturers by means of a duty on imported flax, then the American manufacturer at once loses his position, as his goods must be of inferior quality to those produced elsewhere from better flax.

We submit that the only means for encouraging the growth of flax is to develop a market for it by stimulating manufacturing; and in our opinion the best way to encourage the latter is to admit the raw material free of duty; that raw material it is an absolute necessity to import, as no native flax will meet the requirement. We do not ask any increase of duty on the finished article. The present duty thereon is sufficient, but we do claim that the introduction of the raw material free of duty would put the manufacturers here in the position of being able to compete in point of quality with the world; and would not prevent the development of the culture of flax, but would encourage the same, as before stated.

Accompanying the foregoing communication was the following from Messrs. J. R. LEESON & Co., of Boston, Mass., in regard to the same subject:

Messrs. Finlayson, Bonsfield & Co. are large linen thread manufacturers in Scotland. They have also a fine property—water-power, mills, houses, &c.—in Grafton, Mass., where they are making linen threads and rapidly increasing the production. We sell all the threads this firm makes at Grafton, and all they send here from their mills in Scotland. We thus represent and are interested in both the home and foreign production of linen threads; and we speak not for ourselves only, but also for the firm of Finlayson, Bonsfield & Co., as manufacturers. As a brief statement is sometimes better than an exhaustive dissertation, we will merely indicate what our position is in reference to our product and the tariff.

In view of the fact that the government, as its debt wears away, will demand less and less revenue to pay its expenses, we believe that the question of an increase of duty is not to be entertained at all by your

body. While we do not at this time ask for a reduction on manufactured threads, we do most earnestly and respectfully request that you consider the question of a reduction of duties on the *raw material*, both undressed and dressed. Such reduction, we think we can show, would not be detrimental to the flax culture in this country, for the reason that the imported article does not come in direct antagonism to the flax produced here. We think a candid perusal of the considerations in the accompanying statement of Finlayson, Bonsfield & Co. will make this and other points plain and convincing. As a further indication of our views on these points, and also upon the question of the methods of collection, we beg to submit to you some observations published in an editorial article in the *Manufacturers' Gazette*, Boston, July 29, 1882, as follows:

There are certain reforms pertaining to the collection of revenue which justice to the importer demands. The best interests of the linen trade, as well as of all who have dealings with the custom-houses, would be subserved by the entire abolition of "permit fees" in making entries. These are evidently a relic of an antiquated system of conducting the business, and constitute a piece of red-tape which might well be dispensed with. We likewise are of the opinion that the bond under which importers are placed not only is of no practical benefit to the parties concerned, but that it also consumes much time, both of the importer and of the custom-house clerks, unnecessarily. Were the fees attached to the signing of bonds and the granting of permits abolished, and the importer required to pay simply the amount of duty which the statute specifies, we venture to say there would be no loss to the government, while our import trade would be greatly facilitated.

The customs now require the addition of $2\frac{1}{2}$ per cent. commission to the value of every invoice, upon which the duty appertaining to each class of goods is also levied. Duty is likewise imposed upon transportation charges from inland points to the port of shipment. We believe that, both as regards the commissions and the shipping charges, a reform is demanded; that all such extraneous values should be abolished, and the duty levied on the net value of the goods themselves, with no addition whatever for commissions, freight charges, or fees of any kind. In this opinion we are supported not only by the great mass of importers, but also by the more intelligent heads of departments in the custom-houses who have the supervision of the collection of the revenue intrusted to them.

We regard the free admission of raw materials as of fundamental importance in framing a tariff. That no restriction should be placed on the importation of commodities which in themselves are in great measure natural products, but which enter into the manufacture of other commodities and require a considerable amount of labor in the manipulation, is a principle generally recognized by political economists. Protection should be invoked for the finished article, not for the raw material of which it is made, and which, especially in the case of flax, needs no such aid. When the question of admitting hides free of duty was under consideration, dire results to the cattle raiser were predicted if the proposed change was made. Since the repeal of the duty, however, better prices for hides have been obtained and the profits of the business have in nowise diminished.

We emphatically deny that the farmer requires protection to enable him to grow flax in sufficient quantity for the market and with substantial profit to himself. It is a well-known fact that flax, properly handled, is one of the most profitable crops, whether grown for fiber or for seed. The business of the flax raiser consists not merely in cultivating the staple, but largely in handling it after it is grown. It is a statement readily susceptible of proof that any scarcity of good flax is due to the imperfect knowledge of the correct method of treating this product. We therefore favor the total abolition of the duty on raw flax—first, because we believe that the principle is the true one to follow; and second, because we believe that such a duty is not demanded either by the requirements of consumers or by the cost of production.

Our view, then, regarding the flax and linen thread interests is this: Let the present duty on the finished thread remain undisturbed; remove all vexatious details pertaining to entries; and allow the raw material, whether dressed or undressed, to come in on the same basis as that on which hides and other raw products are admitted, without any charge whatever. This simple method will do more to encourage the growth and extension of the linen industry of America than all the tariff patching and tinkering which were made to appear so attractive at the recent convention at Saratoga.

W. C. DEPAUW.

NEW YORK, *October 5, 1882.*

The following communication from Mr. W. C. DEPAUW, of New Albany, Indiana, in regard to the duty upon plate-glass, was ordered to be printed :

I wish to lay before you some facts in relation to the establishment of plate-glass manufactories in France, England, Belgium, and Germany; the tariff duties that have been levied from time to time; the subsidies paid; the protection afforded for the past two hundred years to establish and maintain this now large industry, as well as the present wages paid in all these countries (except England) and in the United States; and a few facts and suggestions in relation to the establishment of like manufactories in this country.

I went to Europe in August, 1881, with my son, C. W. DePauw, and spent a portion of thirteen months in obtaining information as to tariff and wages abroad. This information has been obtained after long, patient, earnest investigation, after many refusals and denials. Yet, after having been rebuffed and refused on the right hand and on the left, by persevering, an open door was found and reliable statements obtained. Americans do not realize the jealousy that exists abroad against their manufacturing establishments (notably plate-glass). Especially is this true of England, where we are regarded as her greatest rival.

In France, the manufactories are under the control of a syndicate. A like syndicate controls the product of Belgium, and Mr. Octave Houtart is the director there. There is no syndicate in England, yet there is a common understanding, strictly adhered to, that no one shall be permitted to go through their establishments or obtain any information. So in all these countries I was flatly denied admission to any plate-glass works, although I had letters from their largest customers in America as well as the most prominent men of America, and sought and obtained the aid of some of the leading merchants in Europe. Yet it was all of no avail. Hence I had to abandon this line and seek the desired information through government officials and from government records. Here I finally succeeded fully, except as to the now wages question in England. That I could not obtain from the government records or officials; and through two of the leading houses of Europe again sought this information. One of these houses failed entirely after repeated efforts. The other, after many refusals, still felt confident of ultimate success, but to-day has made the following report: "The manufacturers do not feel at liberty to reply to our queries as they say the statistical department in America have recently been endeavoring to obtain details of their manufacture, and they believe and hope unsuccessfully, and they infer that our inquiries may be made on behalf of some firm in America, and on no consideration would they feel inclined to afford us the information asked, and at the same time express their regret at not being able to oblige us."

I regret to say that plate-glass manufacturers in Europe, whose agents called upon me and have been shown through my establishment at New Albany, refused to let me look into their establishments.

First, *tariff*. All the statements and figures in document A, Attached.

hereto, as to plate-glass in England from 1671 to 1856, were copied from the government records. An examination will show you that during all these years the tariff actually prohibited the importation of plate-glass; that from 1671 to 1714 the duty was \$1.29 per square foot. Not content with that, from 1819 to 1829, the duty was increased to \$1.60 per square foot, and then it was increased from \$1.50 to \$2.75 per square foot. This high rate of duty was maintained until 1845, then reduced, but still practically prohibitory.

You will observe that these duties are more than five times as high as the highest duty ever levied in the United States. And in addition to this enormous duty, Appleton's Cyclopædia, volume 8, page 10, says :

The production of plate glass in England was undertaken in 1670, at Lambeth, by the Duke of Buckingham, who imported Venetian workmen. The government encouraged the enterprise, by a bounty upon the glass intended for exportation; and under this protection EXTENDED TO THE DIFFERENT BRANCHES of the manufacture, by which the cost was reduced from 25 to 50 per cent. Many other glass factories sprung up in different parts of the kingdom.

In France, for many years up to November 1, 1860, the importation of window glass was absolutely prohibited.

As to plate glass, it was also prohibited under the severest penalty. For example, in the law which was annulled in 1786, the tariff on large mirrors (all of which are made from plate glass) reads thus: "Importation of mirrors prohibited under pain of confiscation and £3,000 penalty," and under the then laws a failure to pay the penalty sent the importer to prison. From this time until the conventional tariff of 1860 it (plate glass) has either been prohibited or had a tariff duty more than double as high as the highest ever levied in the United States.

In this way, first France, then Belgium (which in glass manufactories is part of France), then England built up and maintained and firmly established the largest and most successful glass manufactories in the world. In fact they have made all mankind buy glass of them. This has been brought about first and mainly by subsidy and protection (and these enormous duties were never for one moment relaxed until their works were so firmly established as to defy all competition), but largely by the very low wages paid their workmen. Schedule B annexed will show that in America we pay from two to four fold as much for labor as is paid in England, France, Belgium, and Germany.

In conclusion, permit me to call your attention to the following facts :

First. That all money put into plate-glass works in America prior to 1879 had been a total loss.

Second. That some of the shrewdest, most energetic and successful business men in Boston, New York, Philadelphia, Detroit, Chicago, Saint Louis, and Louisville had in the aggregate invested millions in plate-glass enterprises and lost the whole of it.

Third. That no plate-glass had been made in America without loss to the maker prior to 1879.

Fourth. That I, instead of having made a large fortune in a few years, as represented, have actually lost more than half a million dollars over and above all small (very small) profit made since 1878.

Fifth. That after a long, earnest struggle I have succeeded in making good glazing plate-glass at a small profit.

Sixth. That Americans are paying about half as much for plate-glass to-day as they paid prior to the time plate-glass was made in the United States at my works.

Under the present tariff duties I have succeeded, in less than ten years, in making plate-glass at a small profit. If the present duties are continued, I believe that prior to 1890 America will make all the glazing plate she requires, and prior to 1900 all the mirror-glass she requires, thus accomplishing in less than thirty years that which has taken France and England hundreds of years to build up.

Allow me to urge that the only safety to American manufacturers is to continue the duty on the square foot; and, to avoid frauds, to increase the duty on all glass under 10 square feet, on some of which duty is now as low as 4 cents.

My own judgment is that if the present tariff rate on plate-glass is disturbed that there ought to be one uniform rate on all sizes of glazing and mirror glass of 50 cents per square foot, the glass to be actually measured by the government on the dock, or in the custom-house, before it is delivered to the importer. If this is not considered practicable, then I would urge by all means not to have any rate under 25 cents on glazing or mirror glass—that is, all under ten feet at 25 cents, and all over ten feet at 50 cents per square foot.

I am led to advise and urge this for the reasons following:

First. The general agent for France, Belgium and Germany, at Paris, said to the Hon. Jessie J. Brown, of this city, that “shippers understand how to evade tariffs.”

Second. One of the leading houses in Paris, in reply to my inquiry, through a friend, as to prices of plate-glass, frankly said “You cannot buy in Paris and pay duty in America. You do not understand the tariff, and can buy cheaper from the French agent in New York, duty paid.”

Mr. J. V. Escott, of J. V. Escott & Sons, one of the leading houses in Louisville, thought, when in Europe, he could buy plate-glass advantageously. On asking for prices he was frankly told to keep his money and buy in New York, as he (Escott) did not understand the New York custom-house regulations; hence could buy cheaper from the agents in New York.

These three facts, which might be multiplied by the hundred, with the additional fact that the price of plate-glass in England and France to the consumer is about 60 cents per square foot on glass of 10 feet and over, while the same glass in America costs about 90 cents per square foot, and yet the tariff duty on this glass is 50 cents per square foot.

If you add to the tariff duty of 50 cents say 10 cents per foot for ocean freights, insurance, expenses of handling, and commissions at New York, you have 60 cents per foot to be paid, leaving for the foreign manufacturer only 30 cents per square foot.

Now, either the government is being wronged in the way of duty, or the foreign maker is supplying glass to America at half the regular price to consumers in England and France.

Is this last supposition reasonable or probable?

A.—Plate-glass tariff in England.

All above wages, except English, are wages current in 1882.

English wages are those paid in 1878, as per United States consul's report that year.

WILLIAM BANEMAN.

NEW YORK, *October 5, 1882.*

MR. WILLIAM BANEMAN, of New York, representing the Tobacco Clay-pipe Makers' Association, addressed the Commission as follows:

The Tobacco Clay-pipe Makers' Association respectfully beg to offer the following facts for your consideration:

The present duty on imported white clay pipes is fixed at 35 per cent. ad valorem. The duty on the raw material, the unmanufactured English or German clay, is \$5 per ton, which, as the price in England averages twenty-five shillings per ton, is equivalent to ad valorem duty of 80 per cent. American pipe-makers are in consequence destined to the use of inferior native clay, the best of which, and that most generally used, is obtained at Woodbridge, N. J., where it is placed upon the market at \$3 per ton. It can readily be seen that if native clay were equal in quality or nearly equal to the imported article, the fact it is sold at one-half the cost of the foreign clay in the foreign market would be a sufficient protection, so far as it is concerned, without the additional aid of a virtually protective duty. But even the Woodbridge clay is so far inferior for working purposes to the European clays that no market worth the name can be found for pipes made of American clay. The enormous importation of foreign clay pipes shows the extent of the demand, while the excessive duty on imported clay handicaps American pipe-makers, and gives the German and English workman a monopoly of the fabrication. Considerable sums of money have already been invested in the manufacture in Brooklyn and elsewhere, but we are handicapped by a duty on the imported raw material more than double the amount of the duty on the manufactured pipes, and enterprise in this direction is thereby restricted. This discrimination is so unjust that we confidently appeal to your honorable body to recommend a measure of relief. The substitution of a specific of 25 cents per gross for the present ad valorem duty on imported clay pipes and the reduction or abolition of the duty on foreign clay for pipe-making purposes would suffice to make pipe-making one of the most flourishing and important of minor American industries. Trusting that this memorial will receive your favorable consideration, I will say a few more words in explanation of this matter. Pipe-making is not one of the great industries of the country, I know, but I think it is one which has an equal right to claim protection with others. Up to a present time it has not been, in my opinion, sufficiently protected. There is an ad valorem duty of 35 per cent. on pipes coming into the market at present, but the pipe-makers in England, and Scotland especially, make their \$8 a week, and I am sorry to say that in this country they cannot make any more. Of course every individual understands that on such wages as that it is impossible for a man in this country if he has a family to maintain them. In the old country they can live very much cheaper than we can here. It requires a larger sum to procure the necessaries of life in this country than it does abroad. Therefore we ask that there shall be a specific duty put upon foreign pipes. I suppose that there are about a thousand pipe-makers in America at the present time, and yet there are not over one hundred journeymen pipe-makers employed here; the rest have been compelled, owing to the smallness of the wages, to get out of the business and go into laboring work. It often happens that the mechanics I employ do not earn over \$6.30 to \$8 a week, while the laboring men in my employ-

ment make more. I think a pipe-maker, after serving from five to seven years learning his trade, ought to be able to make more money than an ordinary laborer. The reason he cannot is on account of competition from abroad. German pipes come into this country at so low a figure that we cannot even buy the material for the price the goods are sold for. After paying at the rate of 35 per cent. duty on pipes they can bring them into this country at less price than it costs us to get the materials. We appeal to you to represent our case in the proper quarter, so that it can be remedied.

I think a specific duty of 25 cents per gross on pipes instead of the present ad valorem duty would be all that we need, because they can swear their goods through at any valuation they see fit. If we had a specific duty of the kind I propose on pipes, I think it would tend to put a stop to that practice.

We also refer in this memorial to the fact that we cannot find a market for our pipes, and the reason is that we have not the same clays in this country to manufacture clay pipes that they have in the old countries. In England they have fine clay, requiring no manipulation whatever. The same is true in Germany and France. We are competing with the wages paid in Germany also. Here we cannot employ a boy unless he is fourteen years of age, and he will not work for less than \$3 or \$4 a week. In Europe men work for a couple of dollars a week, owing to the cheapness of food, rent, and other things. Taking all these things into consideration, I think we have a right to claim more protection than we have at the present time.

By the PRESIDENT :

Question. Is pipe-making an art that has to be learned by serving an apprenticeship?—Answer. Yes, sir; it is.

Q. Is it a difficult art to learn?—A. It requires considerable training. In England and Scotland men have to serve from five to seven years at the business as apprentices.

By Commissioner GARLAND :

Q. Are not these pipes made largely by machinery?—A. No, sir; it has been attempted in many instances in England, Scotland, and America, but has never been successful. They are formed first by the hand, and afterwards molded in a machine. Like all other manufacturers, we are desirous of having a foreign market. Another disadvantage of our labor under is that we have to use imported clay. If we had the clay here we might do better. But to pay \$5 duty per ton on clay, and bring it in to compete with the English, makes it impossible for us to get any profit out of it.

By Commissioner BOTTLER :

Q. If you had the clay duty free, would you not have to reduce the price of labor in order to compete with the cheap labor of the Continent?—A. No, sir; we could not reduce the price of labor, but we would be put in a better condition to compete with these other markets than at present.

Q. Would the getting of your raw material free of duty enable you to compete successfully with Europe?—A. That is a question of time. I think it would add materially towards it; it would be a stepping-stone towards it.

Mr. WILLIAM MASTERS, of New York, representing the same association, stated that he indorsed all that Mr. Baneman had said, and did not desire to make any additional statement.

H. SCHWARTZ.

NEW YORK, *October 5, 1882.*

Mr. H. SCHWARTZ, representing the firm of L. Toplitz & Co., of New York, importers of Scotch caps, addressed the Commission as follows:

I want to speak in regard to the tariff on worsted and knit goods. We are importers of worsted knitted caps, which are not a luxury, and which are not even made here; but they are subject to a duty of 100 per cent., in fact, in regard to some of them, the coarser grades, the rate of duty is as high as 150 per cent. They are classified as worsted and knitted goods. The wool is the least material in the goods, and there is the leather peak and lining, and batting inside, not one of those articles being subject to a duty; but, owing to the fact that there is some wool in the article, we have to pay this high rate of duty. For instance, we had a bill of a better class of goods, where the value of the goods was \$441, and the duty on them amounted to \$430.35—on an article which is not a luxury. I have a report here, which I made to Congress in regard to this matter, which I will read:

JUNE 16, 1882.

Hon. S. S. Cox,
Member of Congress, Washington:

SIR: We take the liberty of inclosing you a copy of one of the letters, which we sent to several newspapers here. As you will perceive, from the contents of this letter, it refers to the additional duty which Mr. Kelley, of Pennsylvania, moved to have put on the woolen knitted goods. The Supreme Court has decided that the way the law reads now, in reference to knitted goods, there is *no error*, and as there has been a Commission appointed by Congress for the revision of the tariff, everything regarding the tariff should be left to that body. We are importers of woolen knitted caps, which is not an article of luxury, but a necessity; they are only worn by laboring men, and, up to the decision of the Supreme Court, we were compelled, by the collector, to pay from 90 to 120 per cent. for these goods, which we can prove you by the following:

We paid, in Europe, for some kinds of woolen caps, 10s. sterling,	
equal to \$2.43	\$2 43
Add to this a commission of 2½ per cent., on which we have	
also to pay duty, would make	\$0 06
Duty, 35 per cent.	88
Weight, 3½ pounds, at 50 cents.	1 75
	2 69

Which will plainly show you that the duty

on this article was over 100 per cent.	5 12
----------------------------------------	------

We are now paying duty, according to the decision of the Supreme Court, 35 per cent., which, in addition to shipping expenses, commission, insurance, &c., which is also 15 per cent., therefore a protection for the so-much-abused home manufacturers of 50 per cent., therefore not so bad as they appear to make it. There is a certain style of cap worn by the poorest laborers in the coal mines, but we cannot import these at the rate of duty formerly imposed upon it; the price of this cap is 6s.

sterling, equal to \$1.48, and, owing to the coarseness of the wool, they weigh 6 pounds to the dozen, and the duty would, therefore, be over 150 per cent.; while fine goods of light weight, manufactured of the finest quality of wool, and which could be considered a luxury, would be only 45 per cent. You will see from the above facts that, if Congress should see fit to advance the tariff on this class of goods 50 per cent., it would be a great injustice.

We have no doubt you will use your influence in preventing as much as possible the passing of any bill for increase of duty; we think that importers have some rights, too, as they help to sustain the government, while the so-much-abused home manufacturers only sustain their own pockets.

We remain, respectfully, yours,

L. TOPLITZ & CO., New York.

The caps which are made in this country are cloth caps, and this class of cap does not interfere in any way whatsoever with them; besides, owing to the pound duty, there is hardly an entry of these goods made where the importers do not suffer great trouble and inconvenience because of their gaining in weight by being damp, and so on. If there is any change in the tariff on these goods, they ought to be put under one rate of duty of 50 or 100 per cent., or whatever rate of duty you decide upon, and have no pound duty to it. This cap is only worn by laboring men, and in that view also the duty is too heavy. The present duty is 35 per centum and 50 cents a pound; while on the fine French caps, which cost about 30 to 35 francs a dozen, and which weigh only a pound and a half, there is only about 40 to 45 per cent. duty; and on this common article the duty runs from 100 to 150 per cent.

By Commissioner GARLAND:

Question. I understand you to say that that cap cannot be made in this country?—Answer. Yes; it can be made here, of course; but they now bring over the shell, which is this woolen part by itself, and put in the leather part here, and the lining inside and the batting inside to make the shape of the cap. That is that they are doing now, owing to the compound duty, and the wool itself does not weigh so much as the lining, and this makes the cap heavier.

Q. Is this article knitted?—A. Yes, sir; it is knitted on a frame.

Q. Is that not done in this country?—A. One party in Utica made some on a machine which came from the other side. He knitted some caps, but most of them are brought over here.

Q. Then they are made here to some extent?—A. Some of them; but so few that they are hardly worth mentioning.

Q. What does that cap cost a dozen here now?—A. About \$6 a dozen by the quantity; but they have to go through about four hands before they reach the wearer.

Q. I thought you said they cost \$2.43 a dozen?—A. The ones I was referring to do, but that is another cap altogether.

By Commissioner McMAHON:

Q. What recommendation do you make?—A. I make the recommendation that if there is from 35 to 40 per cent., in addition to about 15 per cent. for expenses, for commissions, insurance, cartage, freight, &c., it would be a sufficient protection.

Q. You recommend 35 or 40 per cent., then, in lieu of the present duty?—A. Yes, sir; but at any rate take away the pound duty.

Q. That would be practically taking away the pound duty?—A. Well, it was 35 per cent. until recently, when Congress changed the law. We brought a law suit against the government, claiming that these articles ought not to pay more than 35 per cent., as specially provided for, and we won that suit. That is the knit-goods suit that I refer to. Now Congress has passed the law over again.

Q. And you want that changed, as I understand?—A. Yes, sir; I want it changed either one way or the other; and, at any rate, take the pound duty away; it is a continual annoyance.

Q. Who does it annoy?—A. It annoys not only the importer but also the examiner in the custom-house.

Q. Why should it?—A. I will tell you why: For instance, a case comes in which is ordered there for examination. If there should be a pound over in weight he has got to order in the whole lot and see whether the other lots are a pound less; while very often the goods get a very little damp, and they are packed in paper, and owing to that the cap is a little heavier in weight than when it left Europe. Very often that is the case.

Q. What is the general variation where there is a difference?—A. Sometimes it may be 3 pounds, and sometimes 5 pounds; sometimes it has been 15 pounds or over.

Q. Do you account for that by dampness, all of it?—A. No, sir; They weigh them in Scotland by the stone, they do not weigh them as we do here, and there may be a variation on account of that.

Q. A variation of 15 pounds?—A. Yes, sir.

Q. Which would make about a stone?—A. Yes, sir; but an error of that kind might easily be made, as I say it is only a common article, and not an article of luxury; it is only intended for workmen. I would like to show you another article coming in free of duty, while the raw material pays a duty of 30 per cent.

Q. What article is it that you refer to?—A. It is called sparterie. It is an article with cotton, or muslin, in it and comes in free of duty; and the other article, without the muslin, pays a duty of 30 per cent. When there is no muslin in it they call it "willow sheet."

By Commissioner BOTELER:

Q. It is used for bonnets, is it not?—A. Yes, sir; it is made in Bohemia.

By Commissioner GARLAND:

Q. What recommendation do you make with reference to that?—A. I have no recommendation at all to make with reference to it. I only wish to call your attention to it.

Q. Do you think both of these articles should pay a duty?—A. Yes, sir.

By Commissioner McMAHON:

Q. I understand your proposition to be that these caps, having paid 50 cents a pound and 35 per centum ad valorem duty under the decision of the collector, were made to pay 35 per centum alone under a decision of the Supreme Court; that the last Congress passed a special act to correct an error in the law in conformity with which error the Supreme Court made its decision, and that you now ask this Commission to recommend to Congress to report that it was an error to correct the error. Is not that a statement of your case?—A. No; I ask the Commission to ask Congress to reduce the duty on these goods, that is all. I have nothing to do now with the error. The letter which I have read was a

letter which I sent to Washington, at the last session of Congress, before this error, as you call it, was rectified. I do not call it an error.

Q. The last Congress passed an act to correct an error, and now you ask the Commission to say to Congress that the correction of that error was an error?—A. So it is; it was an omission. But I have nothing to do with that.

Q. Very well, I will pass that matter. I understand you to say that there is considerable difficulty between the importer and the government as to the weight of these caps. Is that difficulty shared by other importers besides yourself?—A. Yes, sir.

Q. You know that, in the appraiser's office, if the weight of the package varies from the invoice weight, the examiner is obliged, of course, to call in the remaining packages to verify the invoice?—A. Yes, sir.

Q. Has it always been your usage to give the weights of each package separately?—A. Yes, sir.

Q. For some years did you not pass your invoice at the custom-house in New York with your weights given in a lump?—A. Yes, sir; but as soon as I was told I should have each case separate, I gave each case separate.

Q. You were forced to do that, were you not?—A. Yes, sir; I was told that it should be done. I was protesting at the time against the weight of the goods.

Q. There were variations discovered between the actual weights and the invoice weights on your goods?—A. Yes, sir.

Q. Did you make any mistake against yourselves in those cases?—A. Yes, sir; in some of them; but at the time I had a law-suit against the government for the weight duty. I was claiming all the time that these goods did not pay any weight duty; and finally it was decided that they should not pay any.

THOMAS G. SHEARMAN.

NEW YORK, *October 5, 1882.*

MR. THOMAS G. SHEARMAN, on behalf of the Brooklyn Revenue Reform Club, addressed the Commission as follows:

MR. PRESIDENT AND GENTLEMEN: The Brooklyn Revenue Reform Club, which Mr. A. A. Healy and myself have the honor to represent before you to-day, is an association composed of both free traders and moderate protectionists, who all agree in the necessity of tariff reform, though they may differ as to its extent or methods, and who still more decidedly agree in the desire to have the questions involved in such reform thoroughly discussed, with an honest desire to have the truth ascertained and the right verdict rendered.

If we cared more for the ultimate success of the most radical doctrines held by our members than for the present relief of the country from a part of the burdens now imposed upon it, we should not oppose, before this Commission, the monstrous and greedy demands which are reported to have been made upon it by the various "interests" which have appeared to demand an increase of taxes for their own profit, at a time when all men, not crazy with selfish schemes, admit that taxes ought to be reduced by \$120,000,000 to \$150,000,000 per annum. If the arguments of the iron-ore producers, who want to shut out foreign ores, of a kind which are not and probably never can be found in this country; of the Iowa wool-growers, who cannot keep their own sheep alive and want to kill off the sheep of other lands, better suited to wool raising; of the South Carolina rice-growers, who are willing to testify that they employ two negroes for every grain of rice that they grow; of the quinine millionaires, whose 10,000 men in buckram have sunk to 352 men, women, and children; of the peanut venders, who boldly demand a fresh bounty upon the manufacture of bogus salad oil, to be sold in imitation bottles with forged labels—if these arguments should prevail with this Commission and Congress, and, like the Hebrew king of old time, our rulers should add to our yoke and chastise us with scorpions instead of whips, the certain result would be to break down the whole system of so-called protection and to bring about a rapid change in the direction of free trade, with far less regard to vested interests than would now be conceded by general consent.

But we prefer to take such a course as may (if our views are allowed any influence) help to relieve the country from some of its present burdens, even at the risk of postponing the day of complete deliverance. We therefore submit a few points for the consideration of the Commission, in opposition to all the demands which have been made for an increase of tariff taxes. And in doing this, we shall not, for the most part, raise any issue between the policies of free trade and protection, understanding, as we do, that the Commission was framed with the deliberate intention of excluding, not only every free trader and advocate of a tariff for revenue only, but also everyone whose mind was not thoroughly made up in favor of a tariff for protection, whether it produces revenue or not. Many excellent and eminent men have held such opinions; and whatever we think of a party which purposely shuts out from representation on such a body one-half or more of the

American people, we recognize the perfect right of the Commissioners to hold such views and to carry out the understanding upon which they were appointed.

PROTECTION MUST BE LIMITED.

First. We submit that, under any sensible theory of protection, a tariff which undertakes to protect everything and everybody is simply suicidal. By enhancing the cost of everything it reduces the protection given to each class. To attempt to protect all classes equally is as absurd as to grant a bounty of 10 per cent. on the amount of his taxes to every tax-payer. Tariff taxes, levied for protection, are in substance the same as bounties. They must be distributed sparingly and with discrimination, or they do no one any good.

But most of the schemes which have been lately urged upon this Commission ignore this well settled fact. You have been implored to levy higher and still higher duties upon agricultural products and raw materials, as well as upon every conceivable form of manufacture. The free list is complained of; and every man who raises a peanut or thinks that some day he is going to find a piece of chalk or iron pyrites under his farm, insists that a new tax shall be levied for his benefit. Under the pretense of "developing the resources of our country," a heavy bounty has for years been put upon the destruction of our forests; whereas, if the government is to play the paternal part at all in such matters, it ought to pay a bounty upon the importation of foreign timber, so as to save our own trees from the devastation which is now going on. Of course we do not believe in paying bounties at all; but we do maintain that wood of every sort should, on any rational protective theory, be placed upon the free list.

The production of any other raw materials, while not so disastrous to the country as the wholesale destruction of our forests, is nevertheless often attended with permanent injury. The advantages of coal and metal ores of various kinds are of course great; but their production is attended with certain disadvantages which should make us very willing to draw large supplies from other countries, if they can be obtained at cheaper rates. Coal and ores, once taken out of the ground, can never be replaced; and we are really exhausting our resources while we talk about developing them. The vast amount of these resources makes no difference as to the principle; and indeed the amount of anthracite coal in our country is known to be very limited. Such productions are not proper subjects of encouragement under any truly protective tariff.

FREE WOOL.

Protection, to be at all effective, must be confined to manufactures, and even among these, to such branches as can reasonably be selected for special encouragement. If, for the sake of sustaining half a dozen manufacturers of dye-stuffs, heavy duties are imposed on dyes, our cloth and print makers are directly burdened to an extent which shuts them out of foreign markets. The present duties on wool have made exports of woolen goods impossible; while they have raised up in Texas, New Mexico, and California more formidable competitors than Vermont and Ohio had before. They have not benefited the class of farmers who alone procured their enactment. Iowa Congressmen actually supported the wool tariff of 1867; and the only result, so far as Iowa is concerned, has been to reduce the number of sheep in that State by over one million. It is utterly impossible to carry on any real woolen manufacture here

without a large importation of foreign wool; and if it were admitted duty free, the manufacture would increase so largely as to increase the demand for native as well as foreign wools. A sound protective theory, as well as sound common sense, irrespective of the question of protection, demands that wool should be placed on the free list.

RAW MATERIALS MUST BE FREE.

Nor will it suffice to reduce the duties upon raw materials to low rates. A duty of 10 per cent., or even 5, on the materials which a manufacturer must use, is generally sufficient to prevent him from competing in foreign markets, if not at home, with British manufacturers, who import the same goods duty free. A striking example of this was afforded by the leather trade a few years ago. There used to be a duty on hides of only 10 per cent. While that duty was exacted, the exports of American leather were insignificant. Within one year after that trifling tax was abolished, American leather began to be largely exported; and this trade has constantly and rapidly grown ever since. Our manufacturers must be absolutely relieved from every burden in the way of taxation upon their materials before they can gain any foothold in the markets of the world. This is emphatically one of those cases concerning which a great philosopher has well said that "half measures do not only produce half effects; they produce absolutely no effect whatever."

PROTECTION REQUIRES A LARGE FREE LIST.

The necessity of a large free list has been recognized by all rational protectionists. Hon. William D. Kelley, in his first address to our club, dwelt strongly upon this point, and boasted that he had been the means of placing more articles upon the free list than any other member of Congress. The demand for a reduction of this list comes from persons who do not comprehend the A B C of the protective theory, or who are bent upon securing a bounty for themselves, regardless of the fact that their success will destroy the protective system as a whole. If we sought for the early overthrow of all protection, regardless of the cost, we should second these selfish demands; for the material reduction of the free list would bring about the speedy abolition of the whole protective system.

But the removal of duties on raw materials alone is not enough to make a tariff truly protective. Any scheme which extends over a multitude of articles necessarily defeats its own ends. As already suggested, a bounty to everybody is a benefit to nobody. The present tariff attempts the impossible. It tries to protect every kind of production. The result is that it burdens all, and benefits only a few, and these more by some lucky accident or secret trick than by virtue of any avowed design. Protection, to be effective, must select certain interests, and nourish those only. The working of the present tariff is forcibly illustrated by the fact that, while it was devised more in the interest of the makers of the lower forms of iron than probably of any other one class, its result has been to increase the proportion of foreign iron used in this country to more than three times what it was under the tariff of 1857. Under that tariff, with a duty of 24 per cent., only one-twelfth of the iron used here was imported; under the present tariff, averaging 40 per cent. (but on many things 60 to 70 per cent.), one-fourth of all our iron has recently been imported.

We do not disguise from the Commission that, in our opinion, all

taxes which are levied for the purpose of so-called protection are simple robberies under the forms of law. But if we are to be robbed, we honestly prefer that the money stolen from us shall benefit some of our fellow-citizens, and that it shall not be utterly wasted by a system which, after taking the money out of our pockets, pick so many holes in the pockets of the gentlemen who have kindly relieved us of our cash, that it finally all runs into the sea. We pray you to select a few classes as the objects of our enforced charity, and not to plunder them after they have plundered us. We want to see some persons receive and keep our money, so that we may hold our hats for the few pence which they would naturally be willing to throw back to us out of our dollars. At present it is almost impossible to find any class which can be proved to have derived any great benefit from protection in the last ten years, taken together. They all plead that whatever has been conferred upon them by one section of the tariff has been taken away by another.

FREE BOOKS AND PAPERS.

Among the manufactured articles which ought to be admitted nearly or quite free of duty we mention books and other printed matter, especially newspapers. American printers are sufficiently protected against the bugbear of foreign competition by the absence of international copyright. The tax on foreign books and papers only hinders the spread of enlightenment and international acquaintance; and it is a serious burden on students and literary and scientific men, who are generally poor, while their studies enable practical men to gain wealth. At the very least, all books coming through the post-office from abroad should be allowed to pass free of duty, without the present limit as to value. A large number of books on science, philosophy, art, medicine, theology, and law, not to speak of more general literature, are constantly published in Europe, which are not reprinted here. They are often of more value to students of special subjects than any which are printed here. A tax upon them is a tax on light and knowledge, and a hinderance to the progress of civilization and the useful arts.

On what possible theory of protection should a duty be imposed upon books in German, French, or other foreign languages? It certainly is not needed for revenue; and such books, at least, should be admitted free in any quantities. Neither can the duty on newspapers be needed, either for revenue or protection. They are now admitted free through the mail; but why should not the newsboys of New York have a chance to sell the London papers as freely as the Liverpool boys now sell New York papers?

Photographs, engravings, and all other pictures on paper should be admitted free of duty. They are the only works of art which the poor can have; and the duties are not needed for any purpose of revenue or protection, while it is of great importance to encourage everything which helps to educate and refine the masses of our people. Duties might justifiably be remitted from all works of art, on account of their beneficial influence upon taste and manners; but certainly this should be done so far as the cheaper class of productions are concerned.

By a very unjust discrimination, and, as we think, contrary to law, copies of statuary are taxed much higher than originals. This, again, is one of the many unjust discriminations made in favor of the rich, for it is only the very wealthy who can afford to buy original works of art, while persons in very moderate circumstances can buy copies, if not burdened with excessive duties.

THE TARIFF TO BE SIMPLIFIED.

Second. We heartily indorse the demand for a simplification of the tariff, the abolition of all mixed specific and ad valorem duties, the abandonment of those finely drawn distinctions which have given rise to so much litigation. We add to such demands the request that, in accordance with our first proposition, the tariff be simplified by confining it to a few classes of manufactures which shall be deemed worthy of special encouragement.

The evil results of the complicated system now in force have been set before you with sufficient clearness by officers of the Treasury; but we beg leave to call special attention to some points which seldom attract public attention. The complexities of the tariff have given rise to an immense amount of litigation, all of which is in the hands of a small number of lawyers who give special attention to this branch of business, taking the cases on speculation, and making enormous profits with little effort and generally little legal ability. They form a class by themselves, having an immense pecuniary interest in keeping the law entangled and incomprehensible. Whenever a new tariff law is enacted, it somehow happens that it raises new and doubtful questions, which the Treasury officials invariably decide in such manner as will bring in the largest tax upon each article. An appeal follows the courts, which is not decided for years. Meantime the duty is collected at the highest rate, and the importer, of course, adds this duty to his price, and it is paid in full by the consumer. At the end of five or six years the courts decide that the duty collected was excessive. Sometimes the government refunds the excess, which is then divided between the importers and their lawyers, neither of whom is really out of pocket on the whole affair. The consumers, who are the real sufferers, never get back a penny. Sometimes the government officials, seeing this, openly urge Congress to refuse payment of these claims, which is a bald repudiation of a just and adjudged debt, putting our government on a level with that of Turkey or Mexico. If the latter course is to be adopted, let us openly prohibit all recourse to the courts, and announce at once that the United States government intends to take whatever sums its minor officials see fit to charge, without regard to even its own laws or judicial decisions. For what inducement can there be to importers to contest unjust Treasury decisions, if restitution is to be denied at the end of litigation, on the plea that they have made up their loss in some other way? And yet the result of the other course is to rob the people at large of great sums for no public benefit, and without the pretense or possibility of restitution.

The only complete remedy for these grievous wrongs consists in (1) making the duties simple, clear, and plain, and (2) providing that all serious doubts in the interpretation of the tariff laws shall be decided against the government, leaving Congress to rectify the law, if its intention has been misconstrued. This is the old common-law rule, and it is still older common sense. Congress frames the law; not the taxpayer; and it is the business of Congress to state clearly how much money it wants.

AD VALOREM DUTIES.

Third. We indorse the suggestion of Mr. Moore that duties should be ad valorem rather than specific. We agree with him that the danger of fraudulent invoices can be avoided by official valuations. We suggest that these valuations can be made twice or even four times a year, and

publicly announced, just as the value of foreign coins is now fixed by the Director of the Mint every year, under authority of law. Very few articles need be left for valuation to the consciences of importers; and those would be such as do not compete with domestic goods.

Specific duties inevitably bear more severely upon the poor than on the rich. All indirect taxes operate in that direction, because they are levied in proportion to what men spend in support of their families instead of their accumulations. It is peculiarly unjust and even cruel to aggravate this inequality by making the cheaper classes of goods, with which the poor must be content, pay as heavy a tax as the superior qualities which only the rich can afford. Yet this is the inevitable result of every specific duty. The attempts to remedy this injustice by adding an ad valorem duty only slightly diminish the inequality, while greatly adding to the complications and embarrassments of the tariff. Nothing but a purely ad valorem tariff can meet the difficulty. For such a tariff Henry Clay publicly expressed his preference; and we surely need no higher protectionist authority.

RELIEF FOR 700,000 IMMIGRANTS.

Fourth. It is a disgrace to our republican government that its legislation should be so largely and openly controlled by great "interests." But we recognize the fact that it is, and that the greater part of legislation consists of a scramble on behalf of various persons or classes strong enough to command a hearing, and each seeking to gain some private advantage. Of course every advantage thus conferred upon the applicants for legislation is gained at the expense of the great mass of toilers, whose interests are never represented in the lobby, except when a few of them clamor for some work on a rotten capitol or useless boulevard, in their turn plundering millions for the benefit of a few hundred. So universal is this custom that the very act of Congress under which this Commission sits has been widely understood as designed only to give a hearing to persons who have some avowedly selfish interests to subserve; and we ourselves feel some hesitation in appearing to state facts and arguments which are not designed to put money into our own pockets.

But to be a little more consistent with the apparent intention of Congress in creating this Commission, we beg leave to represent the cause of one special interest, which has never yet found a voice to speak on its behalf. We plead for the 700,000 poor immigrants who will land on our shores during the coming year, and for the millions who will follow them. Why must these poor things be tormented and plundered by custom-house officials, who hate to do the work as much as we hate to see it done? Why must a poor fellow with only two pairs of breeches in the world be forced to pay a heavy tax on one of them? Why cannot a poor Irish woman who has saved a new pair of stockings until her arrival be allowed to take them off the ship without paying 85 per cent. for the privilege? What "interest" demands that a poor creature who has brought a piece of cloth to make a single dress for herself should be robbed of it by nine custom-house officers, as happened not long since—the poor fellows feeling bitterly ashamed of their work, but urged on from behind, like Egyptian soldiers, by a small army of spies? These are real instances out of thousands of similar transactions which make law and government odious in the eyes of the poor, and doubly odious in the eyes of those who are not poor themselves, but have hearts to sympathize with the poor. And even among the richer classes, is it not

a paltry business for a government to compel its reluctant officers to pull about a lady's dresses to see whether they are dirty enough to warrant the belief that they have been "in actual use?" Our laws, as now interpreted, put a penalty on cleanliness and a bounty on filth. There is not the slightest exaggeration in this picture. The only reason why it is not seen more frequently is simply that the officials, to their credit, sicken of their duty.

We ask that every immigrant be allowed, in addition to the articles now admitted free, to bring a reasonable amount of goods of any kind for family use without hinderance. We suggest a limit of \$250 as not too much; but if this will ruin the Treasury, let some other value be prescribed. In addition to the general and obvious reasons in favor of such a rule, we should be disposed to urge the notorious fact that, in the absence of such a privilege regularly conferred by law, the great majority of cabin passengers take it without law, so that scarcely one oath in ten which is extorted from them is strictly true. But the multiplication of oaths by recent legislation, regardless of the impossibility that half of them should be true, warns us that the average legislator rather enjoys forcing people to commit perjury.

In addition to the reasons of substantial justice and good policy which, as it seems to us, call for this change, there are some minor considerations of convenience. Under the present system, everything, however small, which a passenger acknowledges to be subject to duty, must be produced for official inspection, valued by an expert, and formally taxed. The trouble of doing this is often so disproportioned to the amount collected that the officials are justly impatient at the waste of their time. One of our number was present when a gentleman was forced to hunt over his baggage to find a single pair of gloves, which he had not worn, and which were therefore pronounced subject to duty; while another person, who had less than five dollars' worth of photographs, not within the strict form of the oath, which were scattered over three trunks, was told by the officers that he must pull everything out until he found them, before he could be allowed to pay the one dollar which was to be levied upon them. He went to work amid a low rumble of genuine custom-house oaths from the disgusted officers, who could not comprehend that any man of sense would hesitate to tell one little lie rather than pay a revenue tax.

ABOLITION OF OATHS.

Fifth. We hope that the Commission will consider it within their province to consider the whole subject of custom-house oaths. They are entirely useless, because no dependence whatever is placed upon them, and the custom-house officials are always required to examine and appraise goods themselves; and it is the unanimous testimony of the advocates of protection that custom-house oaths are almost uniformly false. This assertion is continually made by the advocates of specific duties; and the belief of the universality of perjury in custom-house oaths is the only justification that can be assigned for specific duties. Certainly the total absence of reverence and solemnity in the administration of such oaths is eminently calculated to bring them into contempt, and to tempt men into perjury. It is safe to say that not one in a thousand of such oaths is administered with the slightest solemnity or dignity, and not one in a hundred is either read by or to read the person making it. We have ourselves watched the administration of such oaths in a multitude of cases, and can speak with knowledge upon this point. Some of us have witnessed scores of persons making oath to the truth of statements on

papers which they were refused permission to take into their hands, and were not allowed any opportunity to read. Some of these oaths are in a form entirely unauthorized by law and even plainly contrary to the statute. The ingenuity of the Treasury Department is constantly exercised to devise sworn statements which shall deprive importers of even such small privileges as the tariff laws allow them; and the subordinate officers, while acknowledging the justice of complaints made on this ground, dare not pass an oath with the slightest alteration.

The requirement of an oath from every passenger coming into this country is of a very recent date, and was due partly to the narrow-minded clamor of a few importers who fancied that their trade was injured by smuggling, and partly to that unwise passion for uniformity which is apt to infect revisers of statutes. It is ineffectual for any good purpose, is very demoralizing in its influence, degrading to the proper solemnity of an oath, and in every way injurious and useless.

We respectfully submit that a real service would be done to religion and morality by the total abolition of custom-house oaths and the substitution of simple declarations, so far as any such are worth having, with the same provision for the criminal prosecution of false declarations as is now provided for perjury.

A REVENUE TARIFF POSSIBLE WITHOUT PROTECTION.

Sixth. We have thus far dwelt upon points which we hope may not be without weight in the minds of the Commissioners, having purposely avoided every proposition which, in our judgment, is inconsistent with the fundamental doctrines of protection to home industry, as taught by Alexander Hamilton and Henry Clay. We now beg to trespass a little upon the time of the Commissioners in order to state clearly our own position, and to answer some of the questions which we observe have been put, in other places, by some of the Commissioners to free traders appearing before them, and which did not appear to us to be fully answered, although upon this point we may be misled by imperfect reports. In the first place, we will answer the oft-repeated question: "What kind of a tariff could free traders propose that would not be protective and yet would raise as much revenue as ought to be raised by means of a tariff?" The Commissioners will please note that we do not propose to answer the question: "How can money be raised by a non-protective tariff which shall be sufficient to meet *all* the government expenses?" Those expenses are so large that the necessary sum could hardly be raised by any tariff. We do not feel called upon to burden ourselves with the preparation of any tariff scheme which should relieve home-made whisky from taxation. We believe that the mass of the American people, whether free traders or protectionists, are heartily agreed that so long as imported sugar is taxed seventy per cent., home-made whisky and tobacco shall not go free. We therefore assume that the present internal-revenue taxes should be substantially continued, and shall only allow for a reduction in internal revenue of \$20,000,000 to \$30,000,000 at the most. The surplus revenue of the United States for the current year cannot, as we are advised, be less than \$180,000,000, and no one pretends to put it at less than \$150,000,000. We maintain, therefore, that the tariff should be cut down by at least \$130,000,000, which would leave only \$68,000,000 to be raised in this manner. This revenue could be raised by duties upon eight articles, of which only one would be in any reasonable sense a protective duty. These articles are sugar (including molasses), coffee, tea, cocoa, intoxicating liquors, tobacco, fruits, and

spices. These articles would be divided into eleven classes, and we append a table showing the amount of each imported in the fiscal year ending June 30, 1881, and the amount of revenue which would be produced by a duty somewhat lower than is now imposed upon each, except in the case of articles which are now admitted free of duty for the sole purpose of maintaining enormous protective duties on other articles. We give the figures only in round thousands of dollars.

PERMANENT TARIFF.

Articles.	Imports, 1881.	Duty.	Amount of ty.
		<i>Per cent.</i>	
Sugar.....	\$84,281,000	45	\$38,826,000
Molasses.....	7,123,000	30	2,137,000
Tea.....	21,004,000	20	4,200,000
Coffee.....	56,784,000	20	11,356,000
Spirits.....	2,070,000	100	2,070,000
Wines.....	6,071,000	40	2,428,000
Beer, &c.....	758,000	30	227,000
Fruits and nuts.....	12,805,000	25	3,201,000
Tobacco.....	6,271,000	00	3,762,000
Spices.....	1,700,000	50	850,000
Cocoa.....	1,082,000	20	216,000
Total.....			69,403,000

In the above schedule of duties there are but two articles on which the duties are in any sense protective. Those are sugar and molasses. But inasmuch as by far the larger part of the sugar and molasses used here is of foreign origin, the greatest proportion of the tax paid upon these articles goes into the Treasury of the United States; unlike the tax upon iron, cottons, and woollens, more than three-fourths of which goes into private pockets. We do not, therefore, feel called upon to devise a tariff scheme more free from all elements of protection than this. It might indeed be completely deprived of its protective features; but we do not think that perfect consistency can be expected in the preparation of so clumsy an instrument for collecting a national revenue, as the best of tariffs must always be.

Recognizing, however, that so sweeping a change as would be in the adoption of such a tariff as is here suggested would be deemed by a great majority of the community unjust to vested interests if adopted suddenly, we should not propose it for immediate enactment, even if we supposed that the Commission would listen to it with favor. But, in deference to public sentiment, we should propose for some years to come to supplement this general scheme by a duty of 25 per cent. ad valorem on all manufactured iron, steel, cotton, woolen, silk, and linen, which, upon the basis of the importations for the fiscal year 1881, would yield a revenue of nearly \$40,000,000, and which, therefore, during that period would make it unnecessary to impose any duties on tea, coffee, and cocoa, and would leave a large annual surplus applicable to the payment of the public debt. This, in our judgment, would be a fair and liberal compromise between the advocates of free trade and protection, and one which is more liberal to the protected interests than they will get at the end of a few years' agitation, when the eyes of the people are opened to the impositions which have been practiced upon them for the last twenty years.

PROVISIONAL TARIFF.

Iron and steel.....	\$46,439,000	
Cotton manufactures.....	31,219,000	
Woolen manufactures.....	31,156,000	
Silk manufactures.....	32,056,000	
Linen, &c., manufactures....	16,159,000	
Total.....	157,029,000	25 per cent. = \$39,257,000
Total of both tariffs.....		103,660,000

ALL TARIFFS OBJECTIONABLE.

Seventh. This is the only opportunity that Congress has ever afforded for a free and public statement of the wishes and beliefs of their constituents upon the question of free trade. And, therefore, without intending to weary the Commissioners by an argument to which, as we are aware, they cannot consistently yield, we beg to state a few of the reasons why we are opposed, not only to protective tariffs, but to all tariffs whatsoever.

PROTECTION IS ROBBERY.

1. As to all *protective* tariffs, we hold them to be simply robbery under the forms of law. We by no means accuse those who believe in the doctrine of protection of any intention to rob or to sympathize with robbery. Some of us have in our own time been firm believers in protection; although none of us ever knowingly benefited personally by the system. We perfectly understand that the great majority of its supporters act from patriotic motives, and that many of them maintain it from the belief that it is good for their country, while convinced that it is not good for themselves. Nevertheless, we respectfully insist that the honest mistake of a good man who unknowingly assists one man to plunder another does not change the character of the action, although it may vindicate the character of the man.

Every protective duty is designed to take money out of the pocket of one citizen in order to put it into the pocket of another who has not legitimately earned it. It is taking the property of one person for the private use of another; and this has been condemned in so many words as simple robbery by the Supreme Court of the United States, in a comparatively recent decision. Taxation is the taking of private property for *public* use, and is justifiable upon every ground of morals. But a protective duty is imposed for the very purpose of making the amount taken from us for public use as small as possible, and compelling us to pay to the protected producer, for his private use, as large an amount as possible. This scheme has been carried out with so much success that, for several years, the United States were entirely deprived of revenue from several important manufactured articles, upon which large amounts of duties would have been collected had they been fixed at moderate rates; while the home manufacturers profited to an immense amount by reason of the prohibitory duties imposed upon these goods. Of these, steel rails are a notable example. When an attempt was made to reduce these duties, about three years ago, a number of railroad presidents signed a memorial to Congress praying for the retention of the \$28 tax on high patriotic grounds; although that tax injuriously affected the railroads which they managed, and had for several years produced only a contemptible revenue to the United States of a few hundred dollars per annum. These patriotic railroad presidents were almost all, if not all, the owners of large amounts of stock in rail-making mills, and were

simply taking from the corporations over which they presided a profit of about \$20 on every ton of rails laid upon their roads. Hence their patriotic views and the self-denying air with which they appeared before the public as preferring to suffer some loss of dividends rather than see the odious foreigner allowed to dump his rails upon our sacred soil. These railroad presidents served their respective corporations at very moderate salaries, as well they might, when the profit which they derived from furnishing rails alone amounted in some cases to more than ten times the amount of their salaries. Now we have no doubt that many stockholders in these corporations admired the patriotism of their presidents, and heartily indorsed their self-denying memorial to Congress. But this does not alter the moral quality of the act; nor does the sympathy of ignorant stockholders in a corporation or citizens in a community, even if they were a majority, transform the robbery of the minority by their aid into an innocent act.

INDIRECT TAXES UNJUST TO THE POOR.

2. But there is a radical objection to all tariffs and all systems of indirect taxation. All such taxes, from their very nature, bear with tremendous hardship on the poor, who constitute the great mass of every community. They are assessed upon the expenditure of each person, instead of his realized property or even his income. Carefully compiled statistics show that nearly 95 per cent. of the American people, prosperous as they are compared with others, do not earn more than \$500 a year to each working person, and average less than \$400. It can be demonstrated by a simple calculation that the existing methods of indirect taxation consume eighty per cent. of all that this vast mass of people are able to save from their earnings; while the same system takes less than twenty per cent. of the savings of a prosperous merchant, banker, or New York lawyer, such as the delegates who now attend before the Commission, and less than two per cent. of the savings of several railroad presidents.

Probably two-thirds of this enormous discrepancy is due to the protective features of the tariff; but under any system of indirect taxation the poor will always pay three or four times their just share. Although ourselves members of the favored class, and well aware that, under direct taxation, we should bear a far larger share of the public burdens than we do now, we earnestly condemn this injustice, and hope to live long enough to see it brought to an end.

INDIRECT TAXES CORRUPT THE GOVERNMENT.

3. Another serious objection to all indirect taxation is that it continually leads governments into extravagance and corruption. It does this in two ways: by concealing from the people the real amount which they pay in taxes, and by raising up private interests which can afford to spend millions rather than to permit taxation to be reduced.

Under direct taxation every man knows just what he pays; and he is naturally interested in keeping extravagance out of the public finances. Under indirect taxation no one knows exactly what he is paying, and vast sums may be wasted without exciting any strong opposition. Of course this is an argument in favor of such taxation among those who want to plunder the Treasury, but it ought to be an almost conclusive argument against it among all honest men.

Again, direct taxation can be and is reduced, instantly upon its being

found that it is in excess of the public needs. No one is injured by such reduction, and the rate may vary every year without disturbing commerce or manufactures. But indirect taxation breeds a swarm of "private interests," which depend upon the maintenance of these taxes for their special profits, and bring influence and money to bear in support of taxes which are not needed for any public use. Thus the internal tax on matches has so changed the whole basis of their manufacture, that the persons who in the first instance pay the tax are the bitterest opponents of its repeal. And it is notorious that the tariff has for years been kept at a rate enormously in excess of the needs of government by the struggle of persons who theoretically are tax-payers, but who practically are tax-eaters. An unhealthy, unsound business grows up around each tariff tax, the managers of which are terrified by the least opposition for reduction in the taxes nominally levied for the public benefit, but actually kept up for mere private advantage.

No better illustration of this can be given than the state of the Federal Treasury to-day. With an utterly unnecessary surplus of over \$150,000,000, rice-growers, salt-makers, silk-makers, watch-makers, pipe-makers, potters, peanut peddlers, iron miners, iron-makers, wool-growers, men who have little chalk farms, and men who have none but expect to find one soon, clamor for an actual increase of taxation, willing that the people at large should be taxed millions of dollars if only these greedy, grasping creatures can gain a few more sixpences. Thank God that there are at least two classes of business men, and those the very ones most universally abused and suspected of selfish motives—lawyers and stock-brokers—not one of whom has come forward to ask for any share in this general scheme of public plunder.

UNFORESEEN EFFECTS OF INDIRECT TAXES.

4. Still another grave objection to all indirect taxes, and especially to protective ones, is that their unforeseen effects are always more or less injurious, and frequently most disastrous. The mysterious consequences of any interference with the course of nature have long been a favorite subject of study to scientific men; and during the long struggle for life of our late honored President, all the nation became familiar with a striking illustration of them. It was observed that the injury to his spine caused more pain in his feet than anywhere else. Just so the interference with natural laws, caused by indirect taxes, is sure to produce results which no human wisdom could foresee. Monopolies arise where least intended by the legislature. Industries which were meant to derive benefit are suddenly ruined. That which was meant as a bounty to one class turns out to be for the exclusive benefit of another. Whole branches of manufactures are destroyed or prevented from ever coming into existence by taxes which were never meant to have any such effect.

Let us give a very few illustrations. In Great Britain the malt tax has always been regarded by farmers as a burden falling almost entirely upon them. But when the genius of Mr. Gladstone devised a means of relief from this tax, which the duller wits of the farmers' chosen friends had never discovered, it was found that the methods employed to collect the malt tax had prevented brewers from using any substitutes for malt; whereas, when the tax was repealed, substitutes for malt were at once made available to such an extent that the farmers now complain that the remedy was as bad as the disease. The excise duties on soap hampered the manufacture to such a degree that no good common soap

was ever made in England until the tax was removed. The duties on paper prevented the application of paper to many uses now familiar. So, in our own country, the imposition of an internal-revenue tax of 5 per cent. on manufactures, although accompanied by an increase of 50 per cent. in customs duties, drove large branches of manufactures entirely out of our country, except for urgent and instant demands, because it was found that the customs duty was paid only once, while the excise duty rolled up again and again with each successive step of manufacture. The worsted manufacture in America was created by the low duties on wool imposed in 1857; it was nearly killed by one of the later tariffs intended to help the wool manufacture generally, and was revived by further legislation. Under free wool it would always have prospered without help. The taxes on sugar and tin-plates prevent us from exporting milk, although milk is cheaper here than in the countries from which we now import condensed milk. But they get the sugar, without which the condensed article cannot be made, free of duty, and our manufacturers do not. The present tariff on wool was devised for the special benefit of sheep-owners in Vermont, New York, Ohio, and Iowa, and without a dream of benefiting Texas, New Mexico, or California. But there are fewer sheep in the first four States together, than there were when the new tariff was adopted; and all the benefit of the wool tariff has gone to the Southwestern States and Territories, which never asked for it and do not now want it.

We thank you, gentlemen, for your polite attention, and hope that you may be able to adopt some part of our earlier suggestions, and that in no case will you increase any of the duties now levied, and which are conceded to be already far in excess of any needs of the public revenue.

I beg to submit, for the consideration of the Commission, the following schedule of specific suggestions:

AMENDMENTS TO THE UNITED STATES REVISED STATUTES.

I. Section 2779 to read as follows:

In order to ascertain what articles belonging to persons arriving in the United States are to be exempted from duty, due entry thereof, as of other merchandise, but separate and distinct from any other merchandise imported from a foreign country, shall be made by the owner thereof, or his agent, with the collector of the district in which the articles are intended to be landed, expressing the persons by whom or for whom such entry is made, particularizing the several packages and their contents, with their marks and numbers; and the person who shall make the entry shall subscribe the same, and may be required by the collector to take and subscribe [an oath] a solemn declaration in the following form:

"I, A. B., do solemnly, sincerely, and truly declare that the foregoing entry contains, to the best of my knowledge and belief, a just and true account of the contents of the several packages therein mentioned; that such packages contain no merchandise whatever other than wearing apparel, personal baggage, professional books, implements, instruments, and tools of trade, occupation, or employment, except other merchandise, not exceeding in value \$250; that they are all the property of [naming the person], who has arrived or is shortly expected to arrive in the United States, and that no part thereof is directly or indirectly intended for sale."

II. Section 2800 to read as follows:

Whenever the person making an entry under the last section is not the owner of the articles specified in such entry, and the duties on such articles, when imported as ordinary merchandise, would exceed \$100, he shall give a bond, with one or more sufficient sureties, to the satisfaction of the collector, in a sum equal to such duties, upon the condition that the owner of the articles shall, within one year, personally make [an oath] a declaration such as is prescribed in the last section.

III. Section 2801 to read as follows:

On compliance with the two preceding sections, and not otherwise, a permit shall be granted for landing such articles. But whenever the collector and the naval officer think proper, they may direct the baggage of any person arriving within the United States to be examined by the surveyor of the port, or by an inspector of the customs, who shall make a return of the same; and if any articles are contained therein which ought not to be exempted from duty, due entry of them shall be made and the duties thereon paid; and when baggage so examined is in the immediate custody of the owner, the collector and the naval officer may, if they think proper, dispense with the entries required by the two preceding sections.

IV. Section 2805 to read as follows:

All [oaths and] declarations to be taken under the provisions of this chapter may be administered by the collector or officer to or with whom the report of entry is made, or by any person authorized by the laws of the United States or of the particular State to administer oaths; and they shall be reduced to writing and subscribed by the person taking and by the person administering the [oath or] declaration.

V. Section 2505.—For “wearing apparel,” &c., substitute as follows:

Wearing apparel in actual use, and other personal effects (not merchandise), professional books, implements, instruments, and tools of trade, occupation, or employment, of persons arriving in the United States, and, in addition thereto, all other articles belonging to any such person not exceeding in value \$250; but this exemption shall not be construed to include machinery or other articles imported for use in any manufacturing establishment for sale.

Insert as follows:

Books in print or manuscript.
Newspapers and periodicals.
Photographs.
Pictures on paper.

If all books are not admitted free, then insert:

Books in other languages than English.
Books, single copies, not intended for sale; and all such books received by mail shall be delivered without entry.

VI. “Strike out the word “oath” wherever it occurs, and substitute “solemn declaration.”

REDFIELD PROCTOR.

NEW YORK, *October 5, 1882.*

Mr. REDFIELD PROCTOR, of Sutherland Falls, Vt., addressed the Commission as follows:

MR. PRESIDENT AND GENTLEMEN OF THE COMMISSION: The producers of American marble ask substantially a continuance of the present duty upon marble, with only such slight modifications as are necessary to simplify the collection of duties, prevent evasions, and carry out the real intention of the law. With this brief preliminary statement, I will read the paper I have prepared:

“The undersigned, producers of American marble, respectfully submit the following statement. It refers mainly to the duty on ‘veined and all other marble in block, rough or squared, not otherwise specified,’ as veined Italian blocks are the important item and in a great measure govern the duty to be fixed on other items:

“This duty should not be reduced on account of—

“First. The importance of the interest.

“The capital invested in the production of American marble in the States of Vermont, Massachusetts, Connecticut, New York, Pennsylvania, Maryland, and Tennessee is at least \$12,000,000; two-thirds of this in quarries and one-third in mills and other improvements.

“There are also valuable deposits, which have been partially developed, and will be largely used in a short time, if the present tariff is not reduced, in the States of Virginia, Georgia, Alabama, California, Iowa, Missouri, Colorado, and no doubt in other new States.

“We estimate the number of workmen engaged to be 6,000, of which number we think one-half should be classed as skilled laborers, being engaged in operating and managing machinery.

“The amount of annual production is about 2,200,000 cubic feet, or over 20,000 car-loads, and the value \$4,500,000. This is five times the number of cubic feet and three times the total value delivered in our port, duty paid, of all marble imported per year.

“Second. The protection of labor.

“It is a great fallacy to call block marble raw material. The value of block marble represents almost entirely labor. The raw material in the mountains in Italy is of little value, but the cost of the blocks is measured by the labor required to blast them out from the mountain, prepare them for market, and move them to the seaboard.

“In this country also an undeveloped marble quarry is of little value, and it is fair to say that the present value of our quarries represents what has been expended in developing them.

“We estimate 80 per cent. of this value as labor, 15 per cent. machinery, and 5 per cent. as marble in the ledge. It cost from \$40,000 to \$75,000 to get the first salable marble from a Vermont quarry.

“The number of days’ labor required in quarrying a block of either Italian or American marble is from two to four times greater than is required in sawing the same block and preparing it for market by the (American) mill-owner.

“Third. The duty protects our skilled labor and the use of machinery against the cheap common labor of Italy.

"We are obliged to use expensive machinery, even under the present tariff, to compete with the cheap labor of Italy.

"The marble there is blasted out, tumbled down the mountain, and roughly dressed by hand, and loaded on carts to be drawn to the vessels, not even a derrick being used until it reaches the sea-port.

"Here it is cut from the quarries entirely by machinery. We estimate the value of the machinery used for quarrying marble alone in this country to be \$1,200,000. Large companies have been formed and do an extensive business in the manufacture of this machinery alone. There are different kinds of machines used in quarrying, and most of the valuable ones were invented and first introduced here at the quarries; but they are adapted to other uses, and are even now extensively used in quarrying limestone, sandstone, and other building stones, and also in mining operations in the Pacific States.

"Our quarries require skilled labor to manage this machinery. We pay for labor of all classes an average of \$1.75 per day. The Italian quarrymen pay less than one-third of this, and they have no capital in quarrying machinery. They are, however, now introducing improved machinery in marble mills and shops, and doubtless will soon do so in quarries. When they do this, our present protection will come far short of putting us on an equality with them."

In regard to this question of labor, our late consul at Carrara, Italy, Mr. Welsh (that consulship having been within the last few months attached to the Leghorn consulate), prepared an article for Scribner's Magazine, which was published in the June number. He gives the price of labor for the men who prepare the blocks of marble at from 25 to 35 cents a day, and of the workmen who do the blasting at 45 cents a day, a day's work beginning at sunrise and lasting until sunset. Our cheapest labor is \$1.35, and the average is \$1.75 a day. He also gives in his article the cost of living of the Italian workmen. He has to travel 5 or 6 miles, perhaps, to his labor, and carries with him (as I can testify from personal observation during the last few months) nothing but a piece of bread for his dinner; many of them have for breakfast only a piece of bread, and for supper some vegetables or cauliflower; wine and meat being great luxuries, and so, even, is macaroni. I have within the last month brought some of the most skillful carvers from Carrara, paid all their expenses, and agreed to give them \$2 a day during the winter, and \$2.25 or more as soon as spring opens. They were getting 70 cents a day at home. We are paying American laborers \$2.50 to \$3 a day, and they will be able to earn this amount of wages as soon as they learn our language.

"Fourth. Protection cheapens the price of the lower grades of marble, which are used by people of small means for cemetery work, and are also used for building.

"The American quarries, while producing some marble better, and commanding a higher price than the veined Italian, have much that is not adapted to the best work, but which, owing to the formation of the deposit, must be quarried in order to get the better grades.

"This cheaper marble is sold at prices which would not pay for production alone, and can only be produced where some portion of the marble commands a higher price. The Italian averages about the same as the best half of the American. (See price list.)

"A reduction in tariff checking the production of this better marble would reduce the production of the cheaper, and enhance its price and prevent its use for building and many common purposes.

"Importations are mainly controlled by three firms, and if the pro-

duction of American marble was checked, these firms could control the price, and the reduction of their duty would merely increase their profits and probably eventually enhance the price of Italian.

"To show the working of the present tariff and its effect on the price of the lower grades of marble, we give the list price for a series of years of No. 3 Sutherland Falls and Rutland marble, of which grades the largest amount is used :

Years.	No. 3 Sutherland Falls.	No. 3 Rutland.
1866.....	\$2 35 to \$3 00
1870.....	2 00 to 2 25
1872.....	1 75 to 2 25	\$1 75 to \$2 50
1873.....	1 50 to 2 00	1 75 to 2 25
1876.....	1 00 to 1 75	1 75 to 2 00
1877.....	1 00 to 1 50	1 50 to 2 00
1878 and 1879.....	1 00 to 1 50	1 50 to 2 00
1880.....	1 00 to 1 50	1 00 to 2 00
1881.....	1 00 to 1 50	1 00 to 2 00
1882.....	1 25 to 1 75	1 25 to 2 50

"This does not fully represent the actual reduction, as we give better marble for the same grade. The price of better grades has also been reduced, but not in so large a percentage.

"It is true by accurate statistics that the average price of our entire production of all grades at the present time is at least 40 per cent. lower than in the years 1867 to 1873. The classes of marble which come nearer being a necessity are made cheaper by the duty.

"Fifth. Marble is a proper subject for duty.

"Italian marble is an article of luxury. We produce marble so nearly like the veined Italian that it is used for the same purposes. The arts, manufactures, or the people at large would not suffer if Italian was not brought in at all; only those engaged in its importation and sale would be losers; and under the present tariff their business is brisk and increasing.

"Sixth. The duty does not restrain trade and is not above the proper point for revenue. The importations prove this. They have increased under the present tariff.

"Large importations were made in 1864, before the present tariff took effect, to avoid the increased duty, and to such an extent that in July, 1864, there was on the docks in New York a supply of Italian marble six months ahead of the demand.

"The revenue from this source for the year previous to the present tariff at the port of New York was \$43,390.40, but under the first year of the tariff, ending June 30, 1865, it was \$81,855.21, or nearly double, notwithstanding the excessive importations to avoid it. From July 1, 1865 to January 1, 1867, it was \$198,064.60.

"We have no complete returns previous to 1867, but from 1867 to 1874 there was a steady increase of importation of from 294,000 cubic feet in 1867 to over 450,000, or more than 50 per cent. for the seven years.

"In 1877, 1878, and 1879, importations were somewhat reduced, but not so much as was the production of American marble, by the hard times. Nor was it reduced so much as the increase had been for the seven previous years.

"Since 1879 the importations have been steadily increasing, and last year were about the same as they were before the panic of 1878. The

present year imports are increasing, as all the importers agree. The following attached slip is cut from the Marble Reporter for September, and was furnished, as we are informed, by an importer, and we presume represents the facts:

*“Great increase of Italian marble.—*In looking over a list of exports from Leghorn, we notice the following in Italian marble: Total from January 1, 1882, to July 31, 1882, 16,560 tons, against the same time last year, 8,740 tons; being nearly double for the seven months of 1882. The mills are all crowded with orders, and prospects for a good fall trade are very flattering.

“Seventh. The rise of our currency to par value has been a practical reduction of the duty. When the present tariff went into operation, gold was at a high premium, which afforded much higher protection.

“Eighth. The freight paid on Italian marble is no protection to us, for the reason that our freights average about the same to Boston, New York, Philadelphia, and Chicago as they do from Italy to those points; while to Baltimore and southern points, or to California, we pay more.

“Ninth. Reducing the duty would not help American manufacturers of Italian marble. Absolute free trade would be but little help to offset cheap Italian labor. In fact the United States are the great consumers of marble, using the whole of our production and being also probably the largest consumers of foreign marble.”

We have always heard from importers that we use more Italian marble than any other country. This article which I have referred to gives the total production of Carrara marble at 150,000 tons a year, and says that of that amount 25,000 tons, or one-sixth, is sent to the United States. But our government returns here show that from 35,000 to 40,000 tons are annually sent here.

By Commissioner OLIVER:

Question. How many cubic feet is that?—Answer. Something over 400,000 cubic feet of this veined Italian marble.

Q. You state that the product of the American quarries is about 2,000,000 feet a year.—A. Yes, sir; about that; but not more than one-half of that is really competing with Italian marble. Some of the men engaged in the foreign trade have claimed that the duty ought to be reduced so that they could manufacture marble in this country; so that they could bring in the Italian marble and manufacture it here. I want to say to you that that is an entire fallacy; it is utterly impossible. Free trade would not help them to do that. With a large premium they could not compete with the cheap labor of Italy. We are the great consumers of marble. Even people in moderate circumstances in this country are consumers of a great deal of marble, which is not the case elsewhere in other countries.

“The West Indies and South America use very little. It is the trade of this country that is sought for by Italian producers. The effect of free trade in marble in England has been to stop mills and lessen the work there and transfer it to Italy.”

That I have directly from the London dealers. Fabricotti's mills have stopped as well as others; and the quarry-men of Italy told me that they could not even afford to saw it in London, but bring it all in there in the slab.

“Tenth. We have invested our money and gathered a large force of employes on the faith of a governmental policy which protected us to a

certain extent against almost the cheapest labor in the world. It would be manifestly unjust to deprive us of that protection.

"Our investments are several times larger than those of American capital in the importation of Italian, and our capital is local and restricted in its use, and, being mainly invested in quarrying, is of little value except for this business, while theirs would suffer little, even from a restrictive duty, as it could be used for other purposes.

"Eleventh. The results of the protection have been greatly to the advantage of the country in many ways. Besides what we have referred to, it has led to the development of many new enterprises in marble and is of greater importance to them than to those whose trade is well established.

"The business is now going on prosperously for the Italian importers as well as for the American producers, and a reduction of the duty would disturb trade, do harm in all ways and good in none.

"We ask further that so far as practicable where the duty is a compound one the ad valorem part should be changed to its equivalent specific duty. In the case of veined blocks we ask that the duty be made 75 cents per cubic foot specific, which is nearly an equivalent of the present duty, and veined blocks are so nearly of uniform value that a specific duty is just and equitable. They are almost universally imported by the cargo, each cargo representing the average production of the quarries. It cannot evade specific duty. It has in the past, by undervaluations, evaded a just ad valorem duty. This point of specific duty is admitted by the importers and requires no argument.

"The duty on manufactures of marble might, without substantial change of the amount, be made partly specific, by case measurement to guard against undervaluation, and we would suggest \$3 per cubic foot and 30 per cent. ad valorem."

"Pedestals should not be rated as part of the statue, as they now are under a ruling of the Treasury. They are very rarely works of art, and we believe frauds have been committed by importing large monuments as pedestals at 10 per cent. and selling them as monuments. See report of Special Agent Bingham to Treasury Department.

"We submit herewith schedule of present rates with amendments we would suggest.

"Want of time prevented our getting the signatures of producers in other States or of all in this State, but we speak from some knowledge of their views and necessities and have no doubt they would concur."

This is signed by a dozen or fifteen firms in Vermont. I wish to submit with that a statement of the present classification of and duty on marble, with a memorandum under each class of what we would recommend.

CHANGES RECOMMENDED IN THE CLASSIFICATION OF AND DUTY ON MARBLE.

White statuary, brocatella, Siena, and verd-antique, in blocks, rough or square.

• *Present duty.*—\$1 per cubic foot; in addition thereto 25 per cent. ad valorem.

We recommend a specific duty at least the equivalent of the present compound duty, and that the classification be enlarged to embrace "Bardiglio," "French blue," "Belgium black," "Lisbon," "Egyptian,"

“Griotte,” Vert Moulin, Siam Colin, Breccia, Bungard, &c., and all other ornamental marbles known as “colored variegated marbles.” We suggest \$2 per cubic foot as a fair equivalent of the present compound duty.

Veined marble and marble of all other descriptions not otherwise provided for, in blocks, rough or square.

Present duty.—50 cents per cubic foot, and in addition thereto 20 per cent. ad valorem.

We recommend a specific duty of 75 cents per cubic foot, this being nearly the equivalent of the present compound duty; the “importers” having heretofore expressed a desire for this duty in preference to the present one.

Sawed, dressed, or polished marble, marble slabs, and marble paving tiles.

Present duty.—25 cents per superficial square foot not exceeding 2 inches in thickness. If more than 2 inches in thickness, 10 cents per foot in addition to the above rates for each inch or fractional part thereof in excess of 2 inches in thickness, but if exceeding 6 inches in thickness such marble shall be subject to the duty imposed on marble blocks.

We recommend that the last clause limiting the classification to slabs 6 inches in thickness, or under, be stricken out, and all sawed marble be subjected to the above duty.

All manufactures of marble not otherwise provided for.

Present duty.—50 per cent. ad valorem.

We recommend a specific duty of \$3 per cubic foot, inside case measurement, and 25 per cent. ad valorem. The Wood tariff bill made this 75 per cent. ad valorem.

I make that suggestion on the strength of the government returns, which show that for recent years the duty of \$1 per cubic foot and 25 per cent. has amounted to nearly \$2 per cubic foot, and has been constantly rising; showing that the tendency is to import more and more of the higher-priced fancy marbles. These marbles do not specially compete with ours, as ours are of the staple kind. But America has a richer collection of these variegated marbles than all the rest of the world. I believe there are quarries in Maryland, and in other States, where they have verd-antique that is far ahead of anything produced in foreign countries, and I think in Missouri, near Saint Genovieve, and in Tennessee, also, if the mines could be developed, we have a marble far superior for these purposes to any foreign marble. We ask this particularly in order to obtain simplification. These other kinds or classes of marble are not included in the present law, but should be. They belong to the class of fancy variegated marbles used for highly ornamental work, and they should be included with brocatella, sienna, and verd-antique, instead of being left to come in under the clause of ordinary veined Italian, which includes all other descriptions not otherwise provided for. That general provision takes in marble which should properly go in the other class.

Veined marble is the great item which I have been referring to. The present duty is 50 cents a cubic foot, and 20 per cent. ad valorem. We recommend a specific duty of 75 cents per cubic foot, this being nearly

the equivalent of the present compound duty; we think it is a cent or two less. The importers have heretofore expressed a desire for this duty in preference to the present one; that was near the close of the session in the last Congress. The importers had been subjected to some trouble, as they claim; several cargoes were seized—two in Boston and two here—charged with being undervalued. The marble had been mostly sent on consignment, and there was some uncertainty about the valuation. I do not claim that they assented to that as a satisfactory duty to them; but they assented to it as the equivalent of the present duty, and admitted that it might be a cent or two less. But it did not vary enough, so that all parties said it was a fair equivalent of the present duty.

Sawed, dressed or polished marble pays a present duty of 25 cents per superficial square foot, not exceeding 2 inches in thickness; if more than 2 inches, 10 cents per foot additional for each inch in excess. If it exceeds 6 inches in thickness, it is subject to the duty imposed on marble blocks. We recommend that this last provision in regard to slabs in excess of 6 inches in thickness be stricken out and all sawed marble be subject to the same duty.

There is no kind of reason why slabs exceeding 6 inches in thickness should not be subject to the same duty as thinner slabs. The tendency of the trade is constantly to the use of thicker marble, and in sawed marbles all come in under the same class.

All manufactures of marble not otherwise provided for pay a duty of 50 per cent. ad valorem at present. We recommend a specific duty of \$3 per cubic foot inside case measurement, and 25 per cent. ad valorem. The Wood tariff bill made that 75 per centum ad valorem.

There are some other points mentioned, which I have not read, and one is a ruling which I believe now prevails in the Treasury Department, that pedestals shall be treated as part of a statue. They are very rarely works of art, but mere manufactures; and, as we believe, frauds have been committed on the revenue by importing what were really monuments, and what were sold as monuments, as pedestals of statuary. I would refer you to the report of Special Agent Bingham, of Boston, to the Treasury Department in regard to these violations of the law. I meant to have had an exact copy of his report made, but I was not able to get it. I believe that he proved that such violations of the law had occurred. So far as the rate of wages in Italy is concerned, the government reports corroborate what I have quoted here from our consul.

By Commissioner BOTELER:

Question. Do any of our quarries produce statuary marble of sufficient fineness and in sufficiently large blocks for the use of the sculptor?—Answer. Yes, sir; it is considerably used and would be much more, except for the fact that artists reside in Italy on account of the skilled labor they are able to obtain there. Mr. Mead and Mr. Powers have both expressed to me the highest opinion of Vermont marble for statuary purposes, and I ask them why they did not come to America and use it. They replied that they must have men to do their work from their designs, who had been trained to the business from youth, and they could not find such men in this country. Our marble is quite as white and fine looking; but it is not quite as hard. Mr. Mead has executed some life-size statues in it.

By Commissioner GARLAND:

Q. You spoke of exporting marble, I believe. Is there any marble exported from this country now?—A. Very little of it, I said, had been

done. We have sent some to Australia. Australia uses more marble probably than all South America, and they are supplied mostly from Europe. We have sent several shipments to London within the last two years, several cargoes, but there is no prospect of building up any business there, for the reason that America consumes as much marble as all the rest of the world together.

Q. What I wanted to ascertain was the comparative prices; how it was that you could export. Was that marble sold at the same price which you get for marble here?—A. Yes, sir; it was, because it was a little different class of marble. It came in as a white marble adapted, for instance, to nice mantel work, and was between the price and quality of Italian statuary and Italian veined marble. It was a white marble which we could sell at a little less price than the highest Italian statuary marble. What was sent to London was in slabs mostly for mantel work, tablets in walls, &c. But there has been no trade established, and there is but little chance of establishing it.

Q. Why?—A. Because they can get mantels so cheaply from Italy that it covers pretty much all the ground.

Q. That was the very thing I was endeavoring to ascertain; whether you were enabled to meet competition in those markets at prices that would pay you?—A. No, sir. The amount of trade is so much less in any foreign country than it is in this, that it is not worth competing for now.

By Commissioner OLIVER:

Q. For what uses do they import marble, generally?—A. This great item of veined blocks is used largely for marble mantels, furniture marbles, for monuments, and for cemetery work. I think the use here for the latter purpose is rather diminishing. It has not been found to stand our climate as well as the American marble, and the same is true in regard to foreign granites.

Q. What is the product of the American quarries used for?—A. We, perhaps, furnish as much as the foreign quarries do in thin marbles for furniture and mantels. We supply more for cemetery work, and probably supply about the same amount that would grade with theirs; that is, of the same price. Besides that, we supply a great deal of this cheaper marble for ordinary cemetery work. Then, too, we supply an immense amount of building marble; probably one-half of the total production of the country goes into building marble; none of that is brought in. That is sold here at a price that would not pay for the freight from Italy. The quarries in Maryland, Pennsylvania, and Connecticut, and also those up here at Tuckahoe, Westchester County, and in Western Massachusetts and Vermont, supply an immense amount of building marble.

Q. Is all that included in your estimate of 2,000,000 cubic feet?—A. Yes, sir. The class which would compete with the Italian would be just about half our production.

By Commissioner PORTER:

Q. It has been stated to us that should the duty on marble be fixed at 50 cents a cubic foot, it would undoubtedly benefit the marble business of the country generally. What is your opinion in regard to that subject, as to whether it would or not be a benefit?—A. I have stated that case as fairly as I can already. I have said that I think it would merely add 25 cents a cubic foot to the profits of three or four firms engaged in importing Italian marble. That business is mainly controlled

by one firm here and one firm in Boston. A member of one of these firms, residing in Italy, was our consul at Carrara; but, some cargoes of marble having been seized here, and the question of undervaluation arising, he was either removed or resigned, and Mr. Welsh was appointed in his place. The result of Mr. Welsh's appointment seemed to be an increase in the valuation of the importations. The business of these importing houses is increasing under the present duty. The importers admit that at present their imports are large and their business flourishing.

By Commissioner UNDERWOOD:

Q. You have said that the American artists who are abroad do not use your marble for statuary, although it is as good as the Italian marble, on account of the fact that the skilled labor which they require cannot be procured in this country?—A. I stated that Mr. Larkin G. Mead, the artist, and Mr. Powers, of Florence, gave me that as a reason, last winter.

Q. They are Americans?—A. Yes, sir; both of them.

Q. What I want to ascertain is this: whether there is any reason why that skilled labor cannot be brought to this country, and other skilled labor trained here for the purpose of working this statuary marble into statues?—A. That, perhaps, may come about in time; but on account of the higher cost of living here, and the higher rate of wages, we cannot compete with foreign labor in this branch.

Q. Is there any other reason, except the cost of living, why laborers could not be brought here and our laborers trained, if you have marbles suitable for statuary? I have an idea that it ought to be formed and fashioned here by the artists. Now, could not the skilled labor necessary to assist in doing that be brought here and our workmen trained to do it?—A. It would be a work of many years to train our workmen. As I have stated, I have been trying to bring some of them here. I have just brought to this country half a dozen of the best workmen I could select in Carrara.

In reference to the use of American marble in statuary, I will state that Mr. Mead's heroic size statue of Ethan Allen in our Vermont State house is made of Vermont marble, and it is quite as white, and probably whiter, than if made of Italian marble, and it stands exposure to the weather better. The Italian productions have to be covered to protect them from the weather. Perhaps some of the members of the Commission may have noticed some of the Italian statuary about the Capitol at Washington. There is one figure on the east front of the Capitol, a very large one, I do not recollect the subject now; but it is nearly all in pieces. In Carrara they cover the statuary with sheds, because the sun and water (there is no frost to speak of there) has such a bad effect on it. The most of our marble is a little softer and will not stand the sharp work of the chisel on the fine lines of statues—the eyelashes and the beard, for instances—although the layers are growing harder as we go into the earth, and some of them are about as hard as the foreign marble. There is a bust by Greenough in the Boston Latin School, on Warren avenue, Boston, or in that part of the city, and I have heard the opinion expressed that the marble was superior to any Italian marble that was ever bought. I do not claim that, for all statuary purposes, it is quite equal to the Italian marble; it is not quite so hard, but, as far as looks are concerned, I think it is quite equal. All the ornamental mantels of the country, and all works of that kind that you see here, are almost exclusively made of American marble.

Commissioner UNDERWOOD. I am not satisfied with the reason given by these artists for not employing American labor.

The WITNESS. Mr. Mead's words to me were these: "We have here workmen who can take our models and execute them so that we have no anxiety on our part. They are trained from the time they are able to handle a chisel, and the business is handed down from father to son."

Commissioner OLIVER. That is to say, it is a business that has descended in families for hundreds of years?

The WITNESS. Yes, sir.

By Commissioner UNDERWOOD:

Q. Is there any physical or intellectual defect in our people which would prevent their being trained to do this same work?—A. No, sir; but I suppose the reason is that there are other kinds of business here that will pay better.

By Commissioner GARLAND:

Q. It is a question of wages, I suppose, rather than anything else?—A. Yes, sir; these Italians cling to their own country, and dislike to leave it; and when they come here and have accumulated about a couple of thousand dollars, they want to go back to their warm sunny climate and to their macaroni. They do not like our style of living.

W. B. HOYT.

NEW YORK, *October 5, 1882.*

The following supplementary statement of changes in the existing tariff, recommended by Mr. W. B. HOYT, assistant appraiser, New York, was ordered to be printed:

Name of article.	Section of tariff.	Present rate of duty.	Proposed rate of duty.	Reasons for proposed changes.
Buttons, lastings, &c...	1357	10 per cent.	Various.....	The difficulty of determining when certain fabrics are so cut "as to be fit for buttons exclusively", affords opportunity for fraud on the one hand, or for unjust classification on the other. The interests involved are not large, and this section might be eliminated.
Bonnets, hats, &c.....	1200	40 per cent.	40 per cent.....	The distinction between the articles named and caps is so indefinite that "caps" should be inserted after "hats". Insert "similar" before "material" in the third line.
Embroidery.....	1264	35 per cent.	Various.....	Under the operation of this section the legitimate duties on the fabrics named may be avoided. I can see no satisfactory reason for its continuance in any form.
Feathers, ornamental and artificial flowers.	1271	50 per cent.	50 per cent.....	Bird skins, with the feathers remaining upon them, are largely imported. To prevent ambiguity, insert after "ornamental", in the first line, "and bird skins with plumage".
Flowers, natural.....	1577	Free.....	20 per cent.....	When evidently imported for ornamental uses they might be subject to a duty of, say, 20 per cent.
Fur.....	1283	35 per cent.	35 per cent.....	Strike out "or of which fur shall be a component material". This sentence embraces too much.
Gloves, kid, &c.....	1287	50 per cent.	Valued at not more than \$5 per dozen, \$2 per dozen; valued at more than \$5 per dozen and less than \$12 per dozen, \$4 per dozen; valued at more than \$12 per dozen, \$7 per dozen.	The ad valorem rate is doubtless the most equitable, but in view of the almost insurmountable difficulties in the way of obtaining an expert knowledge of the value of gloves at the various ports, it may be deemed desirable to adopt a specific duty. The scale proposed would, in my opinion, be about equivalent to the present rate.
Grasses, for ornament..	1816	20 per cent.	20 per cent.....	Natural flowers, grasses, and moss are imported for ornamental purposes, and, when so imported, they should be subject to the same rate of duty, say 20 per cent.
Hats, materials for.....	1300	30 per cent.	30 per cent.....	Substitute "similar" for "other" in the fourth line. The present form is too wide in its scope.
Gutta-percha.....	1204	40 per cent.	} 35 per cent.....	It is often difficult to discriminate between india rubber and gutta-percha when manufactured. To prevent ambiguity these might be embraced in one section, say "articles composed of india rubber or gutta-percha, 35 per cent."
India rubber.....	{ 1307 } { 1310 }	Various....		
Knit goods, and articles made on frames.	{ 1163 } { 1238 }	Various, 35 per cent.	}	The whole of section 1238 should be eliminated, when the articles therein named would be appropriately classified under other sections of the tariff.
Moss.....	1674	Free.....		

Name of article.	Section of tariff.	Present rate of duty.	Proposed rate of duty.	Reasons for proposed changes.
Sparterros	1750	Free	30 per cent.....	Sparterros is a willow sheet, lined with cotton cloth, and should be classified with other materials for making or ornamenting hats, in section 1200.
Woolen and worsted cloths, dress goods, &c.	{ 1162 } { 1163 } { 1166 }	Various.	Valued at not exceeding 40 cents per pound, 20 cents per pound; valued at above 40 and not exceeding 60 cents per pound, 30 cents per pound; valued at above 60 and not exceeding 80 cents per pound, 40 cents per pound; valued at above 80 cents per pound, 50 cents per pound, and in addition thereto 35 per cent.	In lieu of sections 1162, 1163, and 1166, I suggest one section for "cloth, dress goods, and all other manufactures composed wholly or of not less than 20 per cent. in value of wool, worsted, the hair of the alpaca, goat, or other animal (except horse hair), whether woven, knitted, or felted, and not otherwise provided for", with the rates of duty named.

GEORGE M. WESTON.

NEW YORK, October 5, 1882.

MR. GEORGE M. WESTON, of New York, addressed the Commission as follows :

I do not propose in the brief time necessarily given to me by the Commission to undertake to point out all the current errors in respect to foreign commerce, but to notice only a few which are most frequently encountered in the discussion upon that subject.

It is often said that what nations import is purchased and paid for by what they export, and that foreign trade is merely a direct exchange of domestic for foreign merchandise. Such a description of international commerce, if it is a correct one, would make it a purely barter trade. Indeed, the persons who so describe it do not hesitate to characterize it in express terms as being a barter trade; nor do they hesitate to say that it is accompanied by all the conditions of that species of trade, and among others by the condition that merchandise cannot be exchanged abroad except to nations from whom an amount of merchandise equal in value is received in return.* In the case of our own country, for example, the practical instruction which is properly deducible from this account of foreign trade, and which is actually deduced from it by such persons, is that we can dispose of goods only to those nations from whom we will accept goods in exchange, and that we can increase our sales to any particular nation only by increasing our purchases from it. In this instance, as in all instances, those who begin by an enormous use of words, and by confounding things wholly different and distinct, thus end with conclusions which are contrary to the common observation and knowledge of mankind.

The exchanges of trade are of two kinds. The first are direct exchanges of one commodity for another, which is barter. The second are indirect exchanges, through a medium of exchange which is called money. Of the first species of exchange, more common formerly than now, we still have some examples in barbarous regions, as in the exchange on some parts of the African coast of rum, beads, bits of mirror, and brass jewelry for palm oil and elephants' tusks. But in the great bulk of international trade, the use of money long ago superseded the practice of barter; direct exchanges of one commodity for another are unknown; and merchandise is sold for money and purchased with money. With this abandonment of barter, and it is proper to note that this abandonment is much more nearly universal in international than in

* There can be no buying without selling. * * * Every commercial transaction requires two parties, and if one party positively refuses to take what the other has to offer no exchange can take place.—*Westminster Review*, April, 1882.

The Englishman recognizes the truth * * * that all trade is barter, product being given for product, service for service; that to sell, one must buy; and in supplying Chili with cotton cloth he takes his pay for his cloth in what Chili has got to pay with. The American manufacturer, on the other hand, * * * by the act of his government is not allowed to take his pay *directly* in what Chili has got to sell, and as a consequence has not and * * * never will have any considerable trade with Chili. Thus, the commodity which Chili has mainly to sell is copper ore. * * * Congress, since 1869, has imposed rates of duty on copper and copper ore, * * * which have made the importation of either of those commodities into the United States practically impossible.—*Why we trade, &c.* (1878), by David A. Wells.

domestic trade, we escape all the injurious incidents and conditions of barter, among which none is more injurious than that of being compelled to buy of those to whom we sell as much as they buy of us. The invention of money, or the practice of using money, gives freedom to trade, and enables both sellers and buyers to seek the best markets for the transactions they desire to make. Those who have merchandise to dispose of are no longer limited to customers of whom they can advantageously purchase something. And those who wish to obtain particular commodities are no longer limited to obtaining them only from those to whom they can advantageously sell something.

It is undoubtedly true that, subject to certain well-understood exceptions, the proportional magnitude of which is not great, the aggregate merchandise exports during any considerable period of years of any nation must be accepted abroad at a valuation equal to the valuation of its aggregate merchandise imports. The exceptions grow out of the differences of the conditions of nations, as being either debtor or creditor nations, or as they may produce either less or more of the monetary metals than the supply needed for their own uses. A nation like England, using large sums as the annual proceeds of foreign investments, may and must find the balance of its foreign merchandise trade always unfavorable. The Australian colonies, with a production of gold far in excess of their monetary wants, are in the same predicament, because it can only be by a permanent adverse balance of their foreign merchandise trade that their superfluous gold can be drained away; but only in such exceptional cases, and only to the extent which is determined by the nature of those exceptions, can the foreign merchandise trade of any nation be always one way; that is to say, either constantly favorable, or constantly unfavorable.

But it no more follows that international trade is a barter trade, because, as a general rule, the aggregate merchandise imports and exports of nations must, in the long run, balance each other, than that the internal trade between individuals of the same nation is a barter trade, because as a general rule the total amount of services and property of all kinds furnished by each individual to all others must be balanced, in the long run, by the total amount of the services and property received by such individuals from all others. The rule exists with equal certainty in both cases, and the exceptions are the same in character and extent in both. But nobody ever speaks of the internal trade of countries in which exchanges are conducted through the medium of money as being a barter trade, and we know very well that in such countries there are always numerous persons who never purchase anything from those to whom they dispose of either their services or property. Men sell their services and wares for money, and buy with money wherever and of whom they suppose the best bargains can be obtained.

In short, the assertion that in modern times either international trade or trade between individuals is a barter trade is directly opposed by the common knowledge of mankind that the use of money has almost entirely put an end to the practice of barter, and rather more completely so in international transactions than in those which occur between the citizens of the same country.

I do not propose to introduce statistics for the unnecessary purpose of showing as a matter of fact that the world has long since emerged from the state of barbarism and now conducts its exchanges mainly by the use of money and very little by barter. But while the fact needs no proving in that way, it may be usefully illustrated by the condition of our own foreign commerce.

The quarterly report of the Bureau of Statistics for the three months ending December 31, 1881, contains tables showing the merchandise imports and exports (including re-exports of foreign goods) of the United States for the calendar years 1880 and 1881, to and from the various countries with which we trade. Following is a statement of the annual average of the trade with certain countries for the two years, as that may be more satisfactory than a statement for a single year.

Annual average of the trade for 1880 and 1881.

Countries.	Exports to—	Imports from—
England	\$377, 043, 530	\$172, 100, 390
Scotland	33, 145, 882	17, 592, 823
Ireland	54, 088, 110	6, 110, 352
Denmark	5, 328, 055	280, 200
Belgium	33, 115, 817	15, 150, 570
Holland	20, 480, 300	0, 503, 008
Russia	15, 058, 225	2, 607, 300
Spain	13, 012, 520	0, 035, 003
Portugal	4, 082, 737	825, 014
Sweden and Norway	2, 081, 441	1, 232, 000
Germany	65, 349, 500	55, 401, 708
France	84, 038, 514	70, 135, 500
Italy	0, 888, 840	11, 727, 014
China	4, 240, 048	22, 270, 054
Japan	1, 748, 215	13, 408, 184
British Indies	1, 093, 811	20, 430, 023
Dutch East Indies	2, 150, 597	6, 701, 534
Cuba	11, 142, 917	04, 012, 205
Porto Rico	1, 847, 147	4, 452, 405
Dutch West Indies	051, 120	2, 144, 020
Central America	1, 473, 400	3, 700, 035

Our trade with very few countries shows an equality, or any near approach to equality, between merchandise imports and exports. The general fact is inequality in that respect, and in many cases the inequalities are enormous. The figures show at a glance how certain it is that our foreign trade is carried on by barter.

By the course of commerce as now existing the great bulk of our exports are to Europe, from which continent we import comparatively little, and we make use of the money credits thereby obtained in London (the European money center) to pay for the excess of imports over exports in our trade with the West Indies, South America, and Asia.

There is not so much as the one hundredth part of our foreign trade which is carried on by direct exchange or barter. Substantially the whole of our sales are for money, and substantially the whole of our purchases are made with money. We sell always to those who will pay the best price, and without reference to whether they buy little or much from us, and there is no foreign nation which is, or possibly can be, influenced to buy of us because we buy of them. Brazil does not take manufactures from us, because we take great quantities of its coffee, nor do China and Japan take one dollar's worth the more of our cloths or hardware because we are great customers for their teas. Europeans take our agricultural staples, cotton, wheat, corn, pork, beef, and cattle, only because they can make better bargains with us than with anybody else for those things, and they buy none the less because they sell to us comparatively little of other things.

The proverbial saying that there is no friendship in trade has fewer

exceptions in international than in internal commerce. In the latter men deal often directly with the same persons for long periods of time, and there are various motives of personal comity and local interest which induce them, other things being equal, or substantially so, to buy of those to whom they sell. But those motives do not operate at all in foreign commerce, and, furthermore, the business of importing and exporting is largely conducted by distinct classes of merchants, who are often ignorant of each other's operations, and always totally indifferent to them. The merchants who send cotton, wheat, petroleum, tobacco, and breadstuffs abroad for sale, or who fill orders from abroad for such articles, are not the merchants who import tea, coffee, silks, or hardware. The great houses in New York which buy satins, velvets, silks, and ribbons in France pay for them by bills on Paris or London. They never trouble themselves about the staves, potashes, naval stores, or tobacco shipped from the United States to Havre or Marseilles, or with inquiries about the balance of trade between France and this country. It is of no consequence to them whether France buys little or much of us. They buy with money, and wherever they can make the best bargains with money. If they get better bargains in silks and ribbons in France than anywhere else, it is there that they will make their purchases of those articles. This is true of foreign trade in all its ramifications.

The ambiguities and generalities of human language are a fruitful source of error. We speak of selling to England and buying of Chili, but neither of them as a country ever sells anything abroad, and rarely buys anything abroad, unless it is some appliances for war, like the cargoes of mules lately bought of us by British Government agents for use in Egypt. Our transactions of buying and selling are with individual Englishmen and Chilians, or with individual persons, whether of those nationalities or not, who reside and carry on production and trade in those countries, and in most cases those persons from whom we buy are not the persons from whom we sell.

The fact that Brazil sells us a vast amount of coffee certainly gives the Brazilians a good deal of money to spend, but it in no degree compels them to spend that money in purchases from us, nor does it give them any effective inducement to do so. It can only be very artless persons who can imagine that the Brazilians are so grateful to us, on account of our large purchases and large consumption of their staples, that they will go out of their way to buy manufactures, breadstuffs, or lumber from us, rather than from others. If they trouble themselves to think about it at all, they know that we buy no coffee of them which we could get elsewhere on better terms. They have no more reason for being grateful to us than we have for being grateful to the Englishmen and Frenchmen, who have bought so much cotton of us during this century, but who have been all the while trying to stimulate cotton-raising in Guiana, Egypt, Brazil, India, the Soudan, and elsewhere, in order to get what they want on better terms.

In the case of Brazil and of all the South American, African, and Asiatic countries, and of some European countries, the control of their importations is not in their own hands, but of foreign mercantile houses, who are quite free from any national predilections in matter of trade, and who never fail, in buying for the supply of their customers, to buy in the cheapest market. The business of importing at Rio Janeiro is carried on very little by Brazilians, but mainly by Englishmen, Frenchmen, Germans, and merchants of other nationalities. If Brazilians can be principally supposed to be governed in their purchases by good will

towards the United States, as the principal purchaser of their coffee, the foreign mercantile establishments at Rio Janeiro, whether they are mere agencies or are trading independently and for their own account, are influenced by no such romantic feeling. In purchasing such goods as can be profitably sold in Brazil, they go always to the countries in which such goods are obtainable to the best advantage, whether such countries buy much or little of Brazil, and without reference to any sentimental preferences which imaginative persons may suppose to be entertained by the Brazilians themselves, for particular countries, and it is true not only of Rio Janeiro, but of Buenos Ayres, of Valparaiso, of Vera Cruz, of Canton, of Smyrna, and of the trading ports of the greater part of the world, that their exterior mercantile operations are conducted mainly by strangers, who are exclusively occupied with the advancement of their own immediate personal interests.

It may be said that although foreign trade is not conducted by barter, and although there is no necessary equality, either simultaneous or on an average of years, in the sales and purchases between us and any particular country, there must nevertheless be, not within short periods, but in the long run, an equality in our commercial intercourse with the world outside of us, taken as a whole, and this fact imposes upon our exterior traffic, as effectually as actual barter would impose them, the conditions that we must buy in order to sell, and that we can only sell as much as we buy. But there are essential differences between a concurrent equality of merchandise exchanges between us and each foreign country by itself, and an equality on a long average of such exchanges between us and all foreign countries taken together. We might be persuaded in respect to some particular country that access to its markets for some special description of our merchandise was so advantageous that we could afford to pay for such access by purchasing largely of such country, or that an increased importation of some special description of its commodities was so advantageous that we could afford to stimulate it by the surrender of tariff revenue upon them. But we could never be persuaded that it is for our interest to swell the aggregate mass of our importations from the world as a whole, and especially at the direct cost of giving up tariff revenue, without reference to the character of the commodities imported, and merely because such increased importations would cause equivalent exportations at some subsequent time, with no possible means of foreseeing either to what quarters they would be made, or of what they would consist, or whether they would be profitable transactions, or be made under circumstances of sacrifice and disadvantage. In fact, the sort of exportation which is forced by a previous excess of importation is almost invariably a losing business. It is only by draining money away, and thereby reducing prices, that an excess of importation eventually causes an increased exportation, and it is thus true that exports in excess of imports following and resulting from a previous excess of imports must occur under a falling and unprofitable range of prices. Without doubt the average equilibrium is finally restored, but always on losing terms, to countries which embark upon a policy of stimulating imports as a means towards, and a basis for, subsequent exports.

EXPORTS TO PARTICULAR COUNTRIES NOT INCREASED BY REDUCING OUR TARIFF ON THEIR PRODUCTS.

It is said by many persons that we can stimulate our exports to particular countries by inviting large importations of the merchandise

they have to sell, by the method of reducing our duties on them, or, still more effectively, by the method of taking off our entire duties. In addition to the idea that foreign trade is a barter trade, and that we can only sell to any country as much as we buy of it, these persons have the further idea that we can induce countries to buy of us as a matter of good will, by a generous remission of taxes upon what they sell us. But, upon whatever their theories may be based, they find no support in the actual facts of our foreign trade. The European nations, upon whose goods we levy nearly the whole of our tariff revenue, are the principal receivers of our exports, and the balance of our commerce with them is largely and uniformly favorable, whereas the South American and Asiatic countries, a large portion of whose products are admitted into our ports duty free, buy very little of us, and the balance of our commerce with them is largely and uniformly adverse.

For the year ending June 30, 1881, our total merchandise imports were \$440,173,081 dutiable, and \$202,491,547 free, of which last \$5,373,077 came in under the reciprocity treaty with the Sandwich Islands, and \$4,957,482 were articles produced or manufactured in this country, and exported but brought back from a failure to find satisfactory markets. Of the remaining \$192,150,988 of free goods, \$139,591,196 came from Mexico, Central America, the West Indies, South America, Asia, and Australia. I have not access to the figures of the free importations from the British North American Provinces, or Africa, but it is plain that the free importation from Europe must have been absolutely very small, and still smaller relatively to the total importations from that quarter. Our free list is made up mainly of tea and coffee, and of raw materials not produced in Europe.

The larger items on the list of free imports for the year ending June 30, 1881, were the following:

Coffee	\$56,784,391
Hides and skins (except fur skins)	27,477,019
Crude India rubber and gutta-percha	11,054,949
Raw silk	10,888,204
Tea	21,004,813
Fur skins	2,826,494
Medicinal and tanning barks	2,345,667
Cocoa	1,044,813
Cutch and terra japonica	1,699,510
Gums	3,169,826
Indigo	1,535,530
Nitrate of soda	2,356,183
Unmanufactured wood	3,330,333
Dye-wood in sticks	1,676,147

For the year ending June 30, 1881, our merchandise trade with certain countries was as follows:

Countries.	Dutiable im- ports from.	Free imports from.	Total im- ports from.	Exports to.
China	\$3,900,237	\$22,317,729	\$25,218,016	\$5,447,080
Japan	754,851	13,463,249	14,217,600	3,937,511
British India	6,776,002	11,236,204	18,012,206	858,069
Dutch East Indies	2,153,467	5,096,344	7,249,811	1,728,766
Central America	169,577	2,090,209	3,159,786	1,772,240
Venezuela	38,744	6,563,043	6,611,787	2,768,604
Brazil	8,324,928	44,457,608	52,882,536	9,252,415
Uruguay	902,352	8,262,311	4,164,063	1,612,612
Argentine Republic	1,078,162	4,591,078	5,669,240	2,427,893
Dutch West Indies	93,580	2,500,796	2,594,376	940,418
Total	24,191,450	116,478,571	140,670,021	30,746,224

Of the imports from the above-named countries about five-sixths are admitted into our ports duty free, and the amount so admitted in 1880-'81 was absolutely very large, being \$116,478,571. Yet they buy very little of us, and the balance in our trade with them of that year was against us to the great amount of \$109,923,796. Certainly the free admission of so many of their products inures mainly to their benefit and is of very little advantage to our home consumers. In the Commercial Bulletin of September 30, 1880, a free-trade New York City journal, the following appears in the letter of its Rio Janeiro correspondent:

The duty on coffee in the United States was removed in 1872, and prices here went up in corresponding ratio.

The same thing, in a greater or less degree, happens in all cases of the reduction or removal of our duties,* but if any feeling of gratified good will is thereby excited among the foreign recipients of our favors there is no known instance in which they have manifested it in any form which is active and useful to us.

The products of Brazil are nearly all of them taxed upon their admission into Great Britain and France; and in the latter country heavily, but notwithstanding this the Brazilian purchases of merchandise from Great Britain and France are large. In 1880, the latest year of which the figures are accessible to me, Great Britain imported from Brazil \$25,601,051, and exported to Brazil \$32,516,620, thus buying of the Brazilians about half what we buy, but selling to them about four times as much. In the same year French imports into Brazil were \$15,766,161, while Brazilian exports to France were \$18,648,488, the French thus buying less than one-third as much as we do, but selling twice as much. In 1880, in its trade with the Argentine Republic, Great Britain bought \$4,314,775, but sold \$12,366,823; and in its trade with Venezuela it bought \$965,046, but sold \$2,083,553. But it is useless to multiply illustrations of the plain truth of either of the two following propositions:

1. The use of money has long ago, and almost everywhere outside of Africa, superseded barter in international trade, so that there is no necessary equality of purchases and sales between countries having dealings with each other.

2. That the course of international trade and the variations in the balances of it are not influenced by sentimental reciprocations of favors, but by the interests of the merchants who conduct it, and who can never have any other motive in any transaction than the realization of the greatest possible profit to themselves as individuals.

The utmost possible effect which can be produced upon our trade with any particular country, from the reduction or remission of duties upon any of its products, is to increase the exports and consequently the purchasing ability of such country. But the benefit of that increased

* In a lecture (April 18, 1878) before a New York free-trade club, Professor Freeman said:

"These articles [tea and coffee] are natural monopolies, and a tax laid upon them, especially on tea, would fall, for the most part, on the producers of them. The removal of the tax produced no appreciable decrease in their price."

It being the doctrine of his school that tariff taxes fall wholly upon consumers, he was compelled to attempt some explanation of a fact which he could not deny, that the repeal of our tea and coffee taxes inured to the benefit of the foreign producer. His explanation has not even the merit of ingenuity. Tea is raised on a great scale in three different countries, China, Japan, and India, and coffee more or less in perhaps twenty countries. If either was raised in only one country, that would not make it a monopoly or give it any of the features of a monopoly, if the production was carried on freely, as it ostensibly is, by innumerable competing individuals.

ability, instead of inuring exclusively to us, would be shared with us by other commercial nations, and probably in about the same proportions existing before between our exports and the exports of other commercial nations to such country.

An illustration may be found in the case of Chili. The annual average of our merchandise trade with that country during the two years ending June 30, 1881, was \$1,600,896 of exports and \$1,605,403 of imports. In 1880 (the latest year of which I have the figures) the merchandise exports to Chili were \$9,341,023 from Great Britain and \$3,897,815 from France. This shows quite a large importing capacity on the part of Chili, while its actual imports from the United States are very small. The American theorists who have adopted the doctrine that foreign trade is carried on by barter insist that Chili can increase its purchases from us only as it increases its sales to us, and that the true remedy is take off our duty on copper, which gives our market for that metal to our home producers to the exclusion of Chili. During the year ending June 30, 1881, of our total merchandise imports (\$1,435,970) from Chili, \$1,245,529 were duty free, nearly the whole of it, \$1,228,624, being nitrate of soda. It is certainly true that our tariff practically excludes copper importation from Chili, and it is probably true that the abrogation of our duty on copper would cause an export of Chilian copper to this country. To whatever extent it had that effect, the purchasing power of Chili would be augmented, because there would be to the same extent a new market for its copper. In the case of coffee, which we do not produce, and which would not be excluded from our markets by any duties which have ever been imposed or are ever likely to be imposed, the removal of the duty has not increased the exports and purchasing power of Brazil, while it must be admitted that the coming into our markets of copper, previously kept out by a duty, would have that effect upon Chili. But it is gratuitous and without reason to assume that this added purchasing power of Chili would be exclusively directed toward this country. Manifestly Chili could and would buy more, but, other things remaining as at present, the proportions in which it now buys of the United States, Great Britain, France, and other countries, would not be changed.

RECIPROCITY TREATIES IN GENERAL, AND WITH CANADA IN PARTICULAR.

It is because mankind know that it is not true either that foreign trade is a barter trade, or that a country has one efficient inducement to purchase where it sells, or where its products are lightly taxed or untaxed, that international trade arrangements, sometimes by means of concerted and concurrent legislation, and sometimes by reciprocity treaties, have so long formed a considerable part of the diplomatic history of nations. Whatever form such arrangements may take, the principle is always that of stipulations in advance that abrogations or reductions of duty, or the imposition of favorable preferential duties, on one side, shall be paid for by favors on the other side esteemed to be equivalent by the negotiating parties. In other words, the principle is always that of making sure, by an express bargain, of a *quid pro quo*, or of so much for so much.

Doubtless there may be bargains of that kind equal and fair to both parties, but our own experience in such negotiations, happily not extensive, has been uniformly a disastrous one, and is likely to be even more so hereafter, and especially in the case of attempted reciprocity arrange-

ments with the countries situated on the American continent or its adjacent islands. The superiority of our population in numbers, in wealth, and in consuming and purchasing power, is overwhelmingly great in comparison with the population in any of them, and the existing disparity is all the time an increasing rather than a diminishing one. The diplomatist must be astute beyond any example we have yet had in our history who can devise a reciprocity interchange of markets between us and either of those countries which shall not be a losing bargain for the United States.

The same line of argument made use of to persuade us to take off the duties on Chilean copper, and to consume it in preference to consuming our own, was employed in vain to reconcile us to the reciprocity treaty of 1854, which admitted duty free the lumber, bituminous coal, wool, hay, potatoes, barley, cattle, sheep, &c., of Canada, to the growth and production of which this country is by nature equally well adapted. But it was too plain that, even if it was true, as it really was not, that the Canadians would expend in this country the money obtained by selling those articles here, we could increase our sales to them only to the precise extent of the inevitable simultaneous diminution of our sales to the home producers of the same articles. The reciprocity treaty did not increase the quantity of lumber, hay, potatoes, &c., consumed here, but only caused our buying more of them abroad and exactly as much less at home, and caused exactly as much less to be produced at home, and with a corresponding diminution of the numbers, buying power, and actual purchases of home producers. Nor did we gain anything on the score of cheapness, because it turned out that Canadians naturally preferred and were able, instead of selling at their own home prices, to sell at our home prices.

In a monograph entitled "Why we trade," printed in 1878, David A. Wells points out how "sparsely populated" Canada actually is, although "so favored by nature," abounding in lumber, "the natural habitat on this continent of the combing-wool sheep," "growing the finest barley," "raising and grazing the finest of cattle," and fitted in other respects to attract immigration from "Europe as well as the United States." In respect to the province of Ontario in particular, he complains that it could easily support twelve millions of people, whereas it had only two, and that the annual ratio of the increase of its population, which was 4.38 per cent. "during the operation of the reciprocity treaty," fell after the repeal of that treaty to 1.61 per cent. He concludes that an interchange of commodities between the United States and Canada would "augment the present aggregate trade to the extent of many hundreds of millions per annum."

But, upon a large view, there is no good reason for believing that the aggregate population of that part of North America which is north of Mexico has been changed at all, either by the Canadian reciprocity treaty of 1854 or by its abrogation. The controlling factors of the magnitude of that aggregate population have been all along, and still are, its natural increase and the immigration from Europe, neither of which is affected by the particular condition of the commercial relations between Canada and this country. What those commercial relations may affect, and do actually affect, is the proportion in which the aggregate population of Canada and the United States is divided between them. I quite agree with Wells that, if the reciprocity treaty of 1854 had been kept in force to the present time, the population of Canada would have been much greater than it is, but the population of the United States would have been by so much the less. The tendency of free trade would have

been to stimulate emigration from the United States to Canada, whereas since the repeal of the reciprocity treaty there has been a constant and large flow of immigration the other way. Of the persons living in the United States, when the census of 1880 was taken, 717,084 were born in British North America.

We certainly can have no objection to the expansion of Canadian population, and, in fact, should receive benefit from it. But it should be left to come in the natural course of things, and not be stimulated at our expense. We have no occasion to seek Canadian markets for either cattle, sheep, wool, hay, potatoes, or grain of any kind, but shall do best to purchase all those things of our own fellow-citizens, who will be sure to buy of us in return, and whose profits add to our own national wealth and yield tax contributions to our own government.

Without doubt, we can increase importations of lumber by a reciprocity treaty with Canada covering that article and making it duty free. But we can only do it at the loss to our own revenue of whatever is now collected upon imported Canadian lumber, with no gain in cheapness, as we know by experience, and with a corresponding loss of lumber trade with our own States, and especially with our Southern States, whose forest wealth is so abounding. We can by the same method of reciprocity increase our sugar trade with Mexico, just as we now increase it with the Hawaiian Islands, and with the same results of loss of revenue and loss of trade with the domestic producers of the same article. In these cases, and in all similar cases, we add nothing to our aggregate trade, but merely change the parties with whom we trade, under the strange delusion that foreign trade must be presumed to be more advantageous than domestic trade, whereas the contrary presumption is the plain result of both reasoning and experience.

REASONS FOR PREFERRING DOMESTIC TO FOREIGN TRADE.

In a country like the United States, territorially as large as Europe, with all the climates outside of the inter-tropical, and with such a boundless variety of natural resources, the *prima facie* presumption is against the profitability of foreign trade. The cases in which it is profitable are exceptional, and they must be an extremely insignificant fraction of our total commercial transactions, internal and external. Inasmuch as we get both sides of the profits of domestic trade, and only one side in foreign trade, it is manifestly against our interest to import anything which we can produce at home as cheaply or substantially as cheaply, or anything which we can expect to be able to produce as cheaply or substantially as cheaply, after the lapse of a reasonable time for the establishment and development of the requisite industry; or anything like wool, iron, lead, or salt, for which we have natural adaptations, and the home production of which is at the same time important and necessary to national safety and independence, even if some degree, not excessive, of permanent dearness, as compared with importations, may be not improbable.

The reasons for this preference for home to foreign trade are well known, and have long commended themselves to the judgment of mankind. I will refer now to only two of them. The first is, that any superior cheapness of a foreign commodity is liable to be lost by the occurrence of wars, either those to which we might be parties, which would increase the difficulties and expenses of importations, or those to which the countries supplying us might be parties, which would impair their powers of production. The second is, that when we import for con-

sumption anything which might be produced at home we create no additional trade, but merely substitute foreign for domestic transactions, and to whatever extent we may increase sales abroad in payment of what we buy abroad, by so much do we necessarily diminish sales to our own people for what we should otherwise have bought of them. It is certainly true that if we should decide to stimulate our import for consumption of, say, two million dollars' worth of Chili copper, by remitting duties on it, we should either cause an ultimate increase of two millions in our exports to Chili, or, what is more probable, an equal ultimate increase of our exports elsewhere, to be applied through indirect channels in payment for the augmented purchases from Chili; but it is also certain that our sales would be two millions less to home producers of copper, because the home production would be reduced by that much, and with a corresponding reduction in the numbers and purchasing power of those engaged in it. In other words, we should have substituted for a trade of which the profits of both sides and of the whole transportation are now securely enjoyed by us, a nearly equal amount of trade of which there will fall to us only the profits of one side and of such small share of the freighting involved in it as we can hold against the competition of all the carrying nations of all the world. We are constantly lamenting that a large and increasing portion of our foreign trade, in and out, is carried on in foreign bottoms, but we never have occasion to make such a lamentation in respect to our domestic trade.

DIFFERENCE BETWEEN THE FOREIGN TRADE OF THE PRESENT AND FORMER TIMES.

There are certain traditional ideas which mankind have of foreign commerce as a source of opulency, which are misleading, because they overlook the essential difference between the kind of commerce in which the United States and nearly all commercial countries are engaged in these modern days, and the kind of commerce which principally created the wealth and splendor of the trading cities of the ancient world, of the mediæval ages, and indeed of times as near to us as the epoch when the Dutch supremacy in Oriental traffic fell before the superior fortunes of the English.

The exterior commerce of the nations at the present day is the indirect exchange by each country, through the medium of money, of commodities of its own production or manufacture for commodities for its own consumption obtained from other countries. There is no commercial nation now dealing on any appreciable scale in a mercantile way with the commodities of other nations; that is to say, buying them to sell again to others, except Great Britain. Even in that case, although British importing of foreign goods for re-export is absolutely very considerable, it is overshadowed by its vast imports for home consumption. And since the opening of the Suez Canal has given to the cities on the Mediterranean and Black Seas a greater proximity to the farther East than London and Liverpool enjoy, the business of England as an *entrepôt* for the receipt of Asiatic goods for distribution over the continent of Europe tends to decline.

During all prior times, as far back as history or traditions go, the cities on the Mediterranean and its connected seas, and of Western Europe, which have been pre-eminently flourishing and opulent in commerce, became so from dealing as mercantile intermediaries, receiving the spices, rich stuffs, "barbaric pearl and gold" of farther Asia, and distributing them at enormous profits to other nations and cities. Such

was Palmyra or Tadmor, of the Syrian chant, founded according to some accounts by Solomon. Ruined temples and countless Corinthian columns yet standing over vast spaces attest its greatness at a remote antiquity. Pliny describes it as being in his time a city of merchants, trading between the Parthians and the Romans. We know from both sacred and profane history how rich ancient Tyre was, and we know from what principal source its wealth came, from the method taken by Alexander the Great to inflict upon it an irretrievable destruction. That method was to found in Egypt the city still bearing his name, to command the Asiatic trade coming by the way of the Red Sea, and thus forever prevent the building of a new Tyre upon the ruin he had made of the old one. Alexandria continued to be either an emporium or on the transit line of the Red Sea trade until the beginning of the sixteenth century, but in the mean time another part of the traffic from farther Asia reached Bagdad, by the way of the Euphrates, passing thence either to Trebizond, on the Black Sea, and thence to Constantinople, or to Asiatic ports on the Mediterranean. Later on, Italian cities, pre-eminently Venice and Genoa, became the points of distribution through Europe for the merchandise of Asia, and at what prices to ultimate consumers may be imagined from the statement of Prof. J. E. Thocold Rogers (*Agriculture and Prices in England*), that Asiatic spices in British markets were "*once worth half their weight in silver.*" Of the source of oriental merchandise, after it fell under the control of Venice and Genoa, Rogers says, in the same book:

The distribution of the produce was, it appears, generally effected by carriage over the Alpine passes to the few cities of Southern Germany and of the Rhine. In the fifteenth century, such towns as Nuremberg and Ratisbon, Mayence, and Cologne were at the height of their opulence. * * * The trade of the East enriched the burghers of the low countries till, after a long and tedious travel, the abundant spices of the East, increased in price a hundred fold by the tolls which rapacity exacted and the profits which merchants imposed, were sold in small parcels by the grocer, or apothecary, or purchased in large quantities by wealthy consumers at the great fair of Stombridge, or in the perpetual market of London. * * * The stream of commerce which passed through Egypt as far as Antwerp—slender rivulet as it was by the side of what we know now—had been marvelously fertilizing to all who lived upon its banks.

The whole course of trade was changed by two nearly simultaneous events, the passage of the Cape of Good Hope by the Portuguese navigator, Vasco di Gama in 1497, and the complete establishment, by the conquest of Egypt in 1517, of the barbarous, violent, and anti-commercial power of the Turks over all the routes by which the merchandise of the Indies had before reached Europe. From those events dates the decline of the Italian cities, and the rising of the Asiatic colonizing and commerce of the Portuguese, of which the insignificant trading port at Gove is now the solitary remaining monument. It was that commerce which was the principal source of the luxury and magnificence of Lisbon which so affected the imagination of contemporaries while they wondered, and the engulfment of which, by the earthquake of 1755, so excited the horror and compassion of mankind and served so long as one of the most striking illustrations of the instability of human fortunes.

Upon the succession of the Dutch to the Portuguese, as the masters of oriental commerce, Holland became in its turn the richest country in Europe, its wealth being created and existing in its cities, which become the *entrepôts* of the trading exchanges of the world, although having necessarily little domestic trade on account of the diminutions of the Dutch territory and population. The last transfer of ascendancy in oriental commerce was from the Dutch to the English, who still enjoy

it, but in their hands it is an acendency less exclusive than that of any of their predecessors, and it also figures as a less proportional part of their wealth-producing resources.

Until about the middle of the eighteenth century it had thus been true, as far back as history goes, that cities rather than nations had furnished the conspicuous illustrations of wealth and power derived from commerce, and that the traffic which enriched them was the traffic of *entrepôts*, receiving foreign goods to be resold to foreigners. The profits were great, and of course greatest in the distribution of the rare and rich merchandise of the remote and then little-known Indies, the cost of which customers had no means of measuring. In that way it becomes naturally one of the traditional ideas of mankind that the lead in commerce followed the control of the Oriental trade, although it by no means constituted the entire traffic of the *entrepôt* cities of past times.

It will not seem strange that it should also have become one of the traditional ideas of mankind that foreign commerce is the principal source of any great opulence, and that they should fall unreflectingly into the error of overlooking the essential differences between the only kind of foreign commerce known to them until a comparatively recent period, with that trade of modern nations which bears the same name.

In the cases of individual persons, we should never confound the operations of an agriculturist exchanging his crops, directly or through the medium of money, for the supplies of various kinds which he needs, or of a manufacturer exchanging his wares, in the same way, for raw materials and for the means of paying wages to his workmen, with the operations of a merchant, who buys to sell and who sells only what he has bought. Trading is more or less an incident, and a necessary incident, of the business of agriculturists and manufacturers, but we never think or speak of them as traders. All dealings with foreigners are described by an identical phrase as foreign commerce, but there is no more actual similarity between the foreign commerce of Brazil and the Argentine Republic, which exchange agricultural staples for manufactures for their own use, or of Belgium, which exchanges manufactures for raw materials and food for its own use, and the foreign commerce of ancient Tyre, or of the Venice of the Middle Ages, than there is between the kind of trade incident to the business of individual agriculturists and manufacturers and mercantile trade.

It is, therefore, only by a confusion of ideas, resulting from a phrase which has two diverse meanings, that all the glories and splendor and magnificent opulence of the foreigners' commerce of past times, from Palmyra, Tyre, and Alexandria to Venice, and Genoa, and later on to the cities of the Flemings and the Dutch, are held up as irresistible persuasives to the utmost enlargement of that wholly different species of trade which constitutes substantially the whole of the foreign traffic dealings of all the modern nations, except England, and much the larger part in the case of that country.

The exterior trade of the present time is the indirect exchange through the medium of money of the agricultural, mining, or industrial products of our country for the products of other countries for home consumption. It is sometimes a necessity, as in the case of England, with a density of population which compels it to seek a large part of its food abroad, but it is not at all a necessity for this country, which can obtain at home everything which is indispensable. Without doubt, exterior trade is sometimes advantageous, but it is sometimes impoverishing or otherwise injurious. Whether it is the one or the other, depends upon the circumstances of each particular case, and is not a question to be

concluded for all cases by brilliant descriptions of the opulence of the commercial cities of antiquity and of the Middle Ages. To make exchanges abroad which can be made at home, never increases commerce, and oftentimes substitutes a less profitable kind of commerce for a more profitable kind.

EXPORTATION IS NOT NECESSARILY AND ALWAYS PROFITABLE.

It is more easy to persuade mankind of the inexpediency of importations in certain cases, or in many cases, than it is to persuade them that exportation can ever be inexpedient in any case. But the rule that merchandise exportations and importations must balance each other in the aggregate and in the long run, is a two-edged sword, and while it undoubtedly imposes the condition that we must sell in order to buy, it equally imposes the condition that we are compelled to buy to the full extent of our sales. The conclusion, therefore, cannot be escaped, that when we have sold enough to enable us to buy all that it is necessary and expedient for us to purchase, the only effect of further sales will be to force us into further purchases which are neither necessary nor expedient.

There is no conclusive presumption in favor of exportation in general any more than there is in favor of importation in general. In reference to both exportation and importation, what is wise must be determined by the special circumstances of each particular case.

The export of food and raw materials to be exchanged for manufactures can rarely be profitable to countries in climates which are temperate and favorable to manufacturing industry.

The existing trade between the United States and Europe is, at least nine-tenths of it, of a kind by no means permanently desirable. Naturally, Europe produces nothing which we cannot produce as well or better, and as respects manufacturing industry, its principal advantage is the start in the order of time. Temporarily, and until something better could be done, it has been convenient for us to exchange bread and meat for the wares of its artisans, but the agricultural interest will get higher and steadier prices by exchanges of food with artisans at home, and the country as a whole will then have gained the enormous advantage of substituting a domestic trade for a foreign one. In respect to raw materials, we shall get the best returns when we manufacture them ourselves. That our true policy in respect to Europe is to diminish our imports from it, is agreed on all hands,* but it is equally certain, although less obvious, that it is our interest to diminish our exports to it, and for the double reason that we can make a better use at home of most of the exported articles, and that the magnitude of our exports to it induces, and in some senses forces, the imports from it.

The legislative policy of nations in respect to foreign trade was long controlled by the ideas that wealth consists chiefly of the monetary metals; that the true wisdom is to sell a good deal and buy but little, so as to heap up more and more of gold and silver, and that exporta-

* The import from Europe of manufactures is a trade which all parties and the representatives of all shades of economical opinion in this country wish to see steadily diminished and eventually terminated. * * * Some propose protective tariffs and high duties as the best means. Others maintain that the better way * * * is by the production in this country of superior articles at lower prices, * * * with free trade or simply a revenue tariff and cheap raw material. But by whatever way it may be reached, a diminution, tending always to an extinction of imports from Europe, is universally desired in this country.—*Report (1877) of United States Monetary Commission.*

tion is profitable under all circumstances and therefore to be pushed always to the utmost possible extent. These ideas, taken together, constituted what was known as the mercantile theory, now commonly said to be exploded as a matter of science. Undoubtedly it is a theory which is no longer taught, and is in terms universally discarded, but the views which it embodies still exert a large influence upon the opinions and practices of mankind.*

An eminent public man in this country, who has been one of our wisest legislators in respect to measures affecting commerce and industry, has recently called attention to the adverse balance, \$120,000,000 of our trade with the American countries to the south of us. He characterizes it as an exhausting drain, and insists that it is an urgent and pressing duty to close it by increasing our exports to those countries. Without doubt there are many branches of our present export trade to them which can be profitably enlarged, but the existing adverse balance in our commercial intercourse with them is of itself no reason for increasing our exportations in that direction, and there can be no other rational inducement to such increased exportations than the profits to be directly made out of them. The proper effectiveness of that inducement would be equally great if the present balance of trade, instead of being adverse, was a favorable one. It is only under the ideas of the mercantile theory, still lingering and still operating upon the minds of men without their being distinctly conscious of it, that an adverse balance of trade, in any particular quarter, could be treated as being necessarily such an evil in itself as to require an immediate remedy.

It is a sufficient, correct, rough statement of the total foreign commerce of this country to say that there are heavy adverse balances in both our South American and Asiatic trades, and that these are offset by the heavy favorable balance in our European trade. If we put an end to the adverse balance of \$120,000,000 in our trade with South America, by exporting thither \$120,000,000 more in merchandise than we now do, we must either add \$120,000,000 to the present adverse balance of our Asiatic trade, which is not desirable and hardly possible, or we must diminish the favorable balance in our trade with Europe by sending thither \$120,000,000 less of cereals, provisions, petroleum, and other staples than we now do. We have no power to change the permanent proportion between our total imports and our total exports. That is fixed by commercial laws, irrevocable by any known power, and also self-executing and not to be evaded.

It is certainly true that the tendency of things, as our population and industries shall become greater, is towards an increased proportion of manufactured articles, and a diminished proportion of raw materials and agricultural staples in our exports. This tendency is an advantageous and desirable one. Nevertheless, it is best to let it work itself out by a natural and gradual development, and not hurry it by exportations

* The theoretical economists and socialists almost universally still inculcate doctrines in respect to the nature and measure of the value of the monetary metals, which, if true, fairly sustain and justify the mercantile theory, which the same persons all nominally abandon. If gold and silver have, as they teach, an inherent and intrinsic value, determined by the cost of production, either for the time being or upon an average of all past times, the more of them nations possess the richer they are, and no nation can ever have too much of them. What makes the mercantile theory absurd and impossible, is the real fact that the value of money depends in every country, at any given time, upon its quantity, and upon nothing else. As any nation makes progress in piling up the monetary metals by buying little and selling much, those metals fall in value, as indicated by the rise of the prices of everything else, and gold and silver flow away to foreign countries in spite of all attempts of legislation to retain them.

of manufactured articles, made for the mere sake of exportation, and under forcing processes of artificial stimulation. The capacity of the world to buy of us is limited, and we cannot be at one and the same time great exporters of both agricultural staples and of manufactures. It is neither wise in itself, nor just to our farming and planting interests, to diminish the foreign market for our agricultural staples by increasing the proportion of manufactures in our exports any faster than the home market for agricultural staples is enlarged.

It is by no means so clearly desirable, as many persons assume it to be, that this country should ever become a great exporter of manufactures, which can be accomplished in no other way than by forcing our prices down to or below those of the nations which sell at the cheapest rates. There is nothing attractive in any accounts we get of the actual condition of the people of such countries as Belgium and England, which are conspicuous as exporters of manufactures. Dominating the markets of the world is, in the rhetorical aspect, a brilliant and imposing phrase. But a contest of sellers in any market is nothing but a rivalry in reducing prices. Except when the natural or artificial advantages of the contestants are unequal, it is a contest in which only those can succeed who have the capacity and willingness to accept the least profit, and even they are sometimes outstripped by others who may be ready to make positive sacrifices. A contest between domestic sellers in a home market is a contest between those who produce under the same general circumstances in respect to taxation, rents, rates of interest, the degree of comfort in which laborers are accustomed to live, and current wages, so that the competition is kept in most cases within endurable limits. But in the market of the world, the production of a fairly paid labor may confront an unendurable competition in the productions of countries where laborers are slaves, or in conditions very little better than those of actual slavery.

It is the happy fortune of this country, with its amplitude of territory and boundless diversity of natural resources, to be exempt from any actual necessity of going into the markets of the world at all, either to sell or to buy, and to have the option of going into them only where the special circumstances may be auspicious. Our material condition will have reached the point of perfection when our productions shall be so exactly balanced and proportioned to each other that all our raw material, all our food, and all our manufactures shall be sold and consumed at home, excepting only that insignificantly small quantity of them which we may choose to exchange for the few things not reasonably possible to be produced here, which we have formed the habit of indulging in. This ideal perfection is not practically attainable, but we can gradually approximate it, and at any rate we can avoid any policy which will lead us farther and farther from it.

JUNIUS GRIDLEY.

NEW YORK, *October 5, 1882.*

The following communication from Mr. JUNIUS GRIDLEY, secretary of the Bermuda Ocher Company, of New York City, in regard to the duty on ochers and ochery earths, was ordered to be printed:

We desire to present our views and give our reasons why the present duty of one-half cent per pound on ochers and ochery earths should be retained.

Until the year 1871 no ochers were found in the United States that could successfully compete with the ochers imported from France, in point of color and other characteristics. Common ochers, however, were abundant and largely mined, especially in Vermont and Pennsylvania, which are extensively used by oil-cloth manufacturers for a filler in the body of the cloth where the color or tint is of no account. These ochres are so cheaply produced that no imported ochers can affect them, even if the duty were fully removed.

For more than fifty years what are known to the trade as Rochelle ochers have supplied this market with the higher grades, and until our company introduced the Bermuda ocher, these had no competitors, and, until 1876, the price was never under two cents per pound, even at periods when the duty was trifling.

In 1872 we discovered a deposit of ocher on the Appomattox River, at Bermuda, Va., which proved in every respect equal to Rochelle. Recognizing the value of the discovery, we purchased the property and erected works to mine and manufacture it, and have now nearly \$60,000 invested in the enterprise, and employ a force of 40 men. When we first put our ocher on the market in 1872, the price of Rochelle was $3\frac{3}{4}$ cents per pound; we offered ours at the outset at $2\frac{1}{4}$ cents. The result of our competition has been to reduce the price of Rochelle to $1\frac{1}{4}$ cents for large lots to first hands, and our own production to an average of $1\frac{1}{8}$ cents.

We have been obliged to contend against a strong prejudice existing in the minds of consumers, that no American ocher could possibly supplement in quality the imported article. Where it has been introduced this has been dispelled, and consumers freely admit a preference for our article, still insisting that we shall sell it at a less price than the foreign.

The consumption of fine ochers in the United States will not exceed 3,000 tons annually. Of this our sales are 1,000 tons. Since we commenced, two other deposits have been found in Virginia, and are producing a moderate quantity.

Owing to the obstacles we have met with in introducing our article, working against foreign competition and the prejudice in favor of Rochelle, we have only been able from the profits, since we commenced the manufacture, to declare a single dividend of 5 per cent. on the capital stock of our company. Our sales per annum amounting to less than \$25,000 on an investment of \$60,000, would show that we certainly need the protection at present existing.

When we embarked our capital in the enterprise we did not suppose that the imported article could be placed on this market, even if admitted free, at less than about 2 cents per pound. Had such proved to have been the case we could have had a prosperous business.

It may seem strange to your Commission that we cannot produce our article as cheaply as the imported in the face of a large duty. In explanation we would say that, unfortunately, the crude ocher of our deposit contains about 10 per cent. of sand or grit, which we are obliged to remove in order to make it salable. It has all to be dissolved or washed, the grit precipitated out, and carefully dried before it is ground and bolted; this is a long, tedious process, attended with much labor, covering a period of, say, three months, and involving an additional expense fully equal to the duty imposed on the French; while the Rochelle ochers, on the other hand, are, owing to the absence of grit to an extent which would interfere with the sale, simply mined and ground without washing. The Rochelle ochers are shipped as ballast freight, at about one-half the cost that we are obliged to pay from City Point, Va., to New York by steamer.

In conclusion would say that it appears to us that a change in the duty on this article would not be for the benefit of any one. The consumers have reaped the benefit of a lower price than before known, through our competition, and are getting their supplies now at a ridiculously low price. If the importers can sell at the present price at a profit, by placing the article on the free list, as we see you have been advised by an importer should be done, they could then sell it at the same profit at 3 cent per pound, which would shut up our works and wreck the capital we have invested in the business.

We feel that we "deserve well of our country" in developing a home product for which we were before dependent upon Europe to supply.

PETER COOPER.

NEW YORK, *October 5, 1882.*

Mr. PETER COOPER, of New York, appeared before the Commission and submitted the following statement:

GENTLEMEN OF THE TARIFF COMMISSION: The most profound anxiety for the welfare of this great and glorious country impels me to offer some thoughts on what I regard as one of the most important subjects that can be presented to the American people. My experience has compelled me to see and know that all trade with foreign nations is a kind of commercial war; it is a war of interests, as the men of all countries are trying to buy as cheap and sell as dear as they can; this they do by the use of all the arts, both fair and foul, that human ingenuity can invent. There is nothing comparable with the evils that have resulted and may result from a war of commerce. Invasion of armies is attended by waste of property, destruction of life, and suspension of all fair exchanges of the products of labor; but with the return of peace, all is as it was before. Such, however, is not the case with the substitution of foreign trade for the home commerce of the products of our own land and our own labor.

Under the artful and alluring fascinations of the powers of foreign trade associations for mutual benefit, patriotism dies out, intellect declines, and the life-blood of a nation slowly ebbs away, rendering recovery difficult, and closing finally with the material and moral death of a nation.

The great boon provided for us by the Declaration of Independence, with its Constitution and its code of laws, was that Congress shall have power to make all laws which shall be necessary and proper; to levy taxes, duties, imposts, and excises; to pay the debts, and provide for the common defense and the general welfare of these United States.

To accomplish these objects, the Constitution binds every member of the government, under the solemnity of his oath of office, to make their every legislative act an intent to establish justice by the organization and execution of all laws which shall be necessary and proper to provide a shield of protection for the lives, liberty, and happiness of the American people. This can only be accomplished by adopting a just balance in a true system of money, weights, and measures by which justice can be most conveniently established in the operations of trade with foreign nations and among the several States.

Our Constitution was intended to use the strength and power of the nation in giving protection to all the rights and interests in all and every form in which labor can be applied to promote the highest welfare of the American people. Daniel Webster has declared what all must see and know to be true, and in words of warning, as well as to what our government is bound to do, in order to secure the rewards of honest labor to the heads and hands that earned them. He says:

The producing *cause* of all prosperity is labor! labor!! labor!!! The government was *made* to protect this industry, and to give it both encouragement and security. To this very end, with this precise object in view, power was given to Congress over the money of the country.

He predicted that conditions which permitted the rapid accumulation

of property in the hands of a few, remitting the masses to poverty, would soon destroy free institutions.

The experience of a long life made me see and know how utterly impossible it is for the American people to buy anything cheap from a foreign country that must be bought at the expense of leaving our good raw materials unused and our own laborers without employment, thus compelling the millions of the mechanics of our own country to go into competition with the farmers, instead of consuming, as they now do, some three-quarters of all the agricultural products now raised in our country.

The advocates of free trade seem to be perfectly regardless of the wants of those millions of men and women throughout our country who have nothing to sell but their labor; those millions having been in the main reduced to this condition of poverty and want by a course of financial legislation so unwise and so unjust that John Sherman, when a Senator, declared that it was without a parallel in ancient or modern times. In his speech on that occasion he said:

That every citizen of the United States had conformed his business to the legal-tender clause.

His whole speech at that time went to show that the legal money which the government had paid out in full settlement for all the forms of labor and property had been actually used and consumed in the prosecution of our late terrible war for the nation's life. Senator Sherman was right when he declared that the nation's currency could not be contracted without bringing ruin to the debtor and the laboring classes throughout our country.

This cruel and unwise contraction of the nation's currency has, in connection with repeated alterations in our tariff laws, broken up the manufacturing business of thousands throughout our country, and has shown that a tariff of duties should be based on principles that will give security and stability in the manufacture of all articles that can be made out of our own good raw materials, and can be put in forms of usefulness in our country with as small an amount of human labor in this country as in any other part of the world.

This being an incontrovertible fact, there is no good reason why those great manufacturing interests of our own country should be periodically ruined, as they have so often been, by repeated alterations of tariffs. These alterations have been most successfully engineered through our Congress by the consummate skill of foreign diplomats, co-operating as they do with the great manufacturing and mercantile interests of our own and other countries, who can well afford to spend millions to break up and keep down the rising manufactures of this great and growing country.

History shows that England gave the strongest kind of protection to her manufacturing interests until they had attained to such a degree of power and perfection of machinery that enabled the English, with the help of restraining laws, which their government had passed, to prevent their colonies from manufacturing anything for themselves. This fact is shown by the following laws that were passed for the accomplishment of their policy and purpose:

In 1710 a law was enacted in the House of Commons that defined the erecting of manufactories in the colonies which tended to increase their dependence on Great Britain.

In 1782 the exportation of hats from province to province, and the number of apprentices, were limited.

In 1750 the erection of any mill or engine for slitting or rolling iron was prohibited.

In 1765 the exportation of artisans was prohibited under a heavy penalty.

In 1781 utensils required for the manufacture of wool or silk were prohibited.

In 1782 the prohibition was extended to artificers in printing calicoes, muslins, or linens.

In 1785 the prohibition was extended to tools used in iron or steel manufacture, and to workmen employed.

In 1799 it was so extended as to even embrace colliers.

All classes should gather wisdom by reflecting on the history and the experience of the past. Free trade is beautiful in theory, and will be in practice where all things are equal and peaceful in the relations of nations, and rapid transit shall go far to annihilate space.

Our government having allowed and used paper money until the day's labor has been made to cost at least two-thirds more than a similar day's labor would cost in other countries, to bring about an equality in trade, will require a tariff based on the difference in the cost that will purchase a day's labor in our country as compared with that of foreign countries.

If the farmers desire to secure for themselves a reliable market and the highest price for their product, they must use the means best calculated to effect that object—they must encourage the manufacture of the articles they consume, and have them made as near their homes as possible.

To illustrate my views more fully, I herewith give an article published by me some years ago, entitled—

THE DANGERS OF A WAR OF COMMERCE AND THE NECESSITY OF A TARIFF AND OF AN UNFLUCTUATING CURRENCY TO NATIONAL PROSPERITY.

It is now less than seventy-five years since a company, chartered by Great Britain, commenced a mercantile war on the people of Hindostan, a country with its then 150,000,000 of inhabitants, famed for manufacturing the finest quality of goods, and for being in possession of the riches of the East. History tells us that "in no part of the world has there been seen a greater tendency to voluntary association for a voluntary exchange of labor than once existed in Hindostan. * * * Each village had its distinct organization, under which the natives had lived from the earliest times down to a recent date. * * * Revolutions might occur and dynasties might succeed each other, but so long as his own little society was undisturbed, the simple Hindoo gave himself no concern about what might happen at the capital. * * * Though often overtaxed and plundered by invading armies, the country continued both rich and prosperous," until an East India company, chartered and sustained by the power of Great Britain, commenced a war of encroachments on the trade and commerce of that country. This war of commercial interests led to a war of conquest, which, after the battle of Plassey, had established British power in India. "The country became filled with adventurers; men whose sole object was to accumulate fortunes by any means, however foul," as was shown by the indignant denunciation of Burke in the Parliament of Great Britain. Fox declared in a speech on the East India bill that "the country was laid waste with fire and sword, and the land once distinguished most above others by the cheerful face of fraternal government and protected labor, the chosen seat of cultivation and plenty, is now almost a dreary desert, covered with rushes and briars, jungles and wild beasts. * * *" The misgovernment of the English was carried to a point such as seemed hardly compatible with the existence of society. They forced the natives to buy dear and sell cheap.

Macaulay says: "The misgovernment was carried to such an extent as seemed incompatible with the existence of society. They forced the natives to buy dear and sell cheap. They insulted, with impunity, the tribunals, the police, and the fiscal authorities of the country. Enormous fortunes were thus rapidly accumulated at Calcutta, where 30,000,000 of human beings were reduced to the extremity of wretchedness. They had been accustomed to live under tyranny; but never tyranny like this. Under their old masters they had one resource—when the evil became insupportable the people pulled down the government. But the English Government was not to be shaken off. That government, oppressive as the most oppressive form of barbarian despotism, was strong with all the strength of civilization. It resembled the government of evil genii rather than the government of human tyrants. * * * Under the title of Zamindars a landed aristocracy was created and held accountable for the collection of taxes."

Fullerton, a member of the Madras Council, says: "Imagine the revenue leviable through 100,000 revenue officers, collected or remitted at their discretion, according to the occupant's means of paying, whether from produce of the land or his separate property, and in order to encourage every man to act as a spy on his neighbor and report his means of paying, that he may save himself from all extra demand; imagine all the cultivators of a village liable at all times to a separate demand, in order to make up the failure of one or more individuals of the parish. Imagine collectors to every county, acting under the orders of board, on the avowed principle of destroying all competition for labor by a general equalization of assessments, seized and sending back all runaways to each other. Lastly, imagine the collector, the sole magistrate or justice of the peace of the county, through the medium of whom alone complaint of personal grievance suffered by the subject can reach the supreme court. Imagine at the same time every subordinate officer employed in the collection of the land revenue to a police officer, vested with the power to confine, put in the stocks, and slay any inhabitant within his range, on any charge, without oath of the accuser or sworn recorded evidence in the case. * * * Under this state of things, "the works constructed for irrigation have gone to ruin and the richest lands have been abandoned."

Captain Westmeot tells his readers that in many places the longest under British rule, there is the largest amount of depravity and crime. Campbell, one of the most distinguished of British poets, characterizes the course of their policy in India prophetically when he says:

"Foes of mankind!" her guardian spirits say,
 "Revolving ages bring the bitter day,
 When Heaven's unerring aim shall fall on you,
 And blood for blood these Indian plains bedew."

"The immolations of an Indian Juggernaut," says a recent writer, "dwindle into insignificance before it, and yet to maintain this trade the towns and cities have been laid in ruins." The middleman system of Ireland and of the West Indies was transplanted to those countries of the East, to which Macaulay declares that "the English Government became as oppressive as the most oppressive form of barbarian despotism." The poor Hindoo was not allowed to make salt from the waters of the ocean. Every form of tax and exaction was forced on that people in order to drive them to send all their cotton and wool to England (the great workshop of the world), to be converted and returned. Sir Robert Peel says: "The effects in India exhibit themselves in such a ruin and distress that no parallel can be found in the annals of commerce." The great city of Decca, that only seventy years since contained 90,000 houses, and exported millions of pieces of the finest quality of goods, is now a mass of ruins. The same authority says: "For the accomplishment of this work of destruction the children of Lancashire, England, were employed fifteen to seventeen hours per day during the week, and until 12 o'clock on Sunday, cleaning and oiling machinery, for which they received 2s. 9d. per week. The object was to underwork the poor Hindoo and drive him from the markets of the world." The pound of cotton, costing in India one cent, was passed through British looms and sold to the Hindoo for from 40 to 60 cents. "Thus England was enriched, as India became impoverished. Step by step British power was extended, and everywhere was adopted the Hindoo principle that the sovereign, as proprietor of the soil, was entitled to half of the gross produce." While these exorbitant local taxes were expended among its own people, the burden could be borne; when these taxes were drawn from the people and expended on absentee landlords, the burden brought desolation and premature death to millions of the people of that country. History tells us that one-half of the labor of that people ran to waste for the want of employment.

The exactions of British power in China, made to force the sale of opium in that country, are stated to cause the death annually of 500,000 of the Chinese people, besides a tax of nearly \$20,000,000. Campbell says: "The immolations of an Indian Juggernaut dwindle into insignificance before it." The ruin of Portugal was effected by the government having been induced to adopt a British commercial policy that broke up the harmony of the agricultural and mechanical interests—interests that had for so long a time made Portugal so rich and prosperous. "It is less than two hundred years since the merchants of London petitioned their government to restrain the manufacture of cloth in Ireland."

Of all the 1,700,000 slaves imported into the British West India islands, only 660,000 were found living on the day of emancipation. This was the result of a war of commerce. The planters on those islands had been deprived by law of all right "to refine their own sugar, or to introduce a spindle or a loom, or to mine coal, or to smelt their own copper," thus depriving the people of the islands of all power of association, and exchange of labor and harmony of interests, without which ruin falls to the lot of every community. The British policy that was forced on the island of Jamaica alone cost the lives of hundreds of thousands of men, in order that a few absentee owners might live in splendor on the island of England. The policy of forcing the whole labor of a community into the single pursuit of making sugar effectually prevented

the growth of towns and schools and impoverished the people and the land. All communities require the families of the blacksmith, the carpenter, mason, and other tradesmen to consume a large part of the agricultural product of the soil, to secure them prosperity, and to enable them to leave off to enrich the land that feeds them. "On the island of Jamaica, with a population of 320,000 black laborers, and with inexhaustible supplies of timber, that island has been without a single saw-mill up to 1860." Out of the amount paid to the British Government by the people thirty years since for the products of its 320,000 black laborers, the home government took no less than \$18,000,000, or almost \$60 per head, and this merely for superintending the exchanges. The negroes imported into Jamaica were no more barbarian than those brought to Virginia and North Carolina; yet, while each of the negroes imported into the latter States is represented by seven of his descendants, the British islands present but two for every five they have received. But a century since Portugal and the West Indies were England's best customers. What are they now? All impoverished by a policy that has broken up their own home commerce, and has subjected their countries to the heaviest kind of a tax—the tax of transporting their heavy products to great distances, to be exchanged for the light products of other countries.

The war of the Revolution of our country was brought on by a war of commercial interests. It was a war that showed a determination on the part of the mother country to keep her colonies entirely dependent on England for all forms of manufactured articles. Laws were enacted to prevent the colonies from manufacturing out of their own good raw materials things indispensable for their own use, and necessary to give employment to those who have nothing to sell but their own labor. The war of the Revolution was a war of resistance to a war of commerce then being forced by the mother country on the colonies. Our conquest of a country did not deliver us from the consummate power of highly-educated British diplomats, whose business it has always been to find the weak places in surrounding governments, and to so control the legislation of those countries as to make them tributary to the wealth and power of Great Britain. These diplomats, after having secured for their own manufacturing interests more perfect protection and more perfect mechanical powers than any other nation possessed, have enabled their government to gain greater advantages by their war of commerce on our own country than they could have gained if the colonies had remained entirely under their own control.

Such has been the consummate ability that foreign diplomacy has been able to exert in a war of commerce which has brought our country in debt to foreign governments to an amount the interest on which is now equivalent to a large proportion of the agricultural export of the country. This state of things must continue or grow worse, unless our government will raise its whole revenue out of duties on imports, and relieve the country from all forms of direct taxation, and by that means encourage the application of knowledge, economy, and labor in a course of efforts to supply our own wants by our own industry, out of our own good raw materials, that can be put into useful forms with as small an expense of human labor here as in any other part of the world. Thus it will enable the country to win back its independence of foreign debt by paying it off as fast as the amount can be raised from the duties on imports.

Our government can only hold its power as a free system by avoiding in future all special, partial, or class legislation, and by the enactment of only such general laws as are necessary and indispensable to establish justice. Justice can only be established "and the general welfare promoted" by the government holding an entire control over all that is allowed or intended to measure or weigh the different forms and values of labor in its course of exchange from one person to another. Hence the absolute necessity for the establishment of a just and unyielding system of money, weights, and measures. This is indispensable to facilitate the business of the country. A paper money should have been coined for our country at the close of the late war, in amount equal to the cost of the late war. That amount saved for our country a nation's life. That amount should have been made the unfluctuating measure of all values for all coming time, and *only increased per capita with the increase of population.*

Such a currency, made receivable for all forms of taxes, duties, and debts, both public and private, would always be as uniform in its purchasing power as the yard, the pound, and the bushel measure. It would be, as it was in Venice, more valuable than gold, where it lasted five hundred years without a panic. The people of our country should never forget that one of the great causes that led to the American Revolution was the determination on the part of Great Britain to force its manufactures on the colonies, to be paid for by sending raw materials to England, thus keeping them dependent by preventing them from manufacturing for themselves. This policy of England has drawn to its little island the wealth of every country that has allowed itself to become the subject of its policy and power. It is still trying to persuade the people of this country to run their plows in competition with the mighty machines in England, where a single engine is doing the work of a thousand horses. To see the folly of yielding to a British policy, we have only to look at the effects

produced on our country during the war with England. At that time, when our foreign trade was cut off, labor was in demand and money abundant; furnaces and mills were built, and all actively employed; wages were high, and our national debt small. Four years later, our country was persuaded to yield to a British policy of free trade. At once all was changed; mills and furnaces were stopped, labor went begging, our poorhouses were filled, the price of land declined, money became scarce and interest high; the rich who held mortgages became richer, and the poor and those who were in debt were ruined. At that time the American farmer had no foreign or home market for the surplus product of the country. Complaints grew and increased until things grew so bad that in 1828 our government found it necessary to adopt what I call a true American system—a system of free trade—a trade that extended to all parts of our own country, in all articles that are the product of our own soil or of American labor. By this system duties were laid on imports that soon gave new life and energy to the trade and business of the country. The public debt was soon paid off, and prosperity became universal. By degrees, between 1834 and 1842, the tariff was again repealed by the influence of southern and pro-slavery politicians, whose whole wealth was invested in cotton and slaves. The mills were again stopped, furnaces closed, lands fallen to half-price, the sheriff at work, States repudiating their debts, the Treasury unable to borrow at home or abroad, and bankrupt laws passed by Congress. In 1842 the true American system was again tried, and in less than five years the production of iron alone rose from 200,000 tons to 800,000 tons. Prosperity was again universal, mines were opened, mills were built, and money plenty, and the public and private revenues greater than ever. Once more, in 1846, the British policy of free trade was adopted by repealing our tariff, and, notwithstanding the discovery of gold in California, money was as high as ever. British iron came in and gold went out. In 1857 the culmination was reached and a crisis came on. The Treasury was again nearly bankrupt. In three years emigration fell below the point of twenty-eight years before, and our own exports fell off to a mere nothing. Such have been the effects of yielding to a policy recommended by men and nations having interests to serve that are at war with all the best interests of our own country.

A war of commercial interests is not peculiar to England alone. It has been the habit of all trading nations since "naught said the buyer." They will all continue to buy in the cheapest market and sell in the dearest as long as men do not love their neighbors as they do themselves. There are thousands of those now engaged in foreign trade whose fortunes depend on filling the country with foreign goods. There are other thousands who are holders of mortgages, who hope to buy in the property for the face of their mortgages, or for half its present value. And that they will do as soon as they can induce our government to try another experiment in what they call free trade. The policy of these persons, who are all clamorous for free trade, would deprive millions of men of their means of living by mechanical employments, and drive them into competition with the farming and agricultural interests of the country, making the mechanics competitors of the farmers instead of consuming, as they now do, ten times as much of the agricultural product of the country as is now sold in all Europe.

It would be as unwise for our country in time of war to govern the movements of armies by the advice of our enemy as it would be for our government to allow our national policy to be controlled by the advice of the trading nations of Europe, who will always consult their own interests entirely independent of any interests of ours. It is well to remember that there is nothing that can be said to be purchased cheap of foreign countries that must be bought at the expense of leaving our own labor unemployed, and our own good raw materials unused. I advocate the cause of our manufacturing interest, because they secure to the farmer his surest and best market for the agricultural products of the country, and because experience has demonstrated the fact that the surest way to maintain our independence, and cheapen goods to the consumer, is to foster the home productions of our country and give diversified employment to our people. And I advocate an American system because I desire the political power and the financial honor of the nation to be maintained and vindicated before the world. This can be most effectually accomplished by making ourselves independent as far as our own soil and climate and good raw materials will enable us to produce the articles we need; and this they do with as small an expense of labor as it would require to produce the same articles in any other part of the world. I advocate a policy that will maintain the national government and pay the nation's debt out of duties on imports. The heaviest duties should be laid on all articles of luxury and the lightest duties on all articles that will aid in securing a diversified employment to our people.

There is nothing else our government can do that will so effectually stimulate and develop all the best energies of a free people as will the adoption of a just, uniform, and unyielding system of money, weights, and measures. It is greatly to be regretted that our government failed in its very commencement to perform the most important duty enjoined by the Constitution. They should never have allowed the individual

States to issue paper money that *was to all intent bills of credit*. It has been the inflation of irredeemable paper money that has so raised the price of all property and labor that we now tempt the world to sell us everything, and we have made everything with us too dear to sell with profit in return. Free trade with foreign nations *must*, where all things have been made unequal by the use of paper money, prove, in the future as it has in the past, a delusion and a snare. It must, in the future as it has in the past, bring panic, pressure, and ruin to untold thousands made bankrupt by the change of value in all kinds of property. This must be the result of leaving our own labor unemployed and our own good raw materials unused.

After all I have read, written, and published to the world on the all-important subject of a tariff, I come to the conclusion that it should give full and complete protection to what Daniel Webster calls the producing cause of all prosperity, which he says is "labor! labor!! labor!!!"

This can only be accomplished by an amount of duties that shall equal the difference between the cost of a day's labor in our country as compared with the cost of a similar day's labor in other countries.

The difference, when carefully examined, will be found to be on an average, in this country, of from 50 to 150 per cent. more than what is now being paid for similar labor in other countries.

It will thus be seen that justice cannot be established, and the general welfare of the American people be secure, except by the manufacture of all those articles which are absolutely necessary for our consumption as a free and independent nation. Duties on all the most necessary and essential articles of industry, which our government was made to protect, encourage, and secure, should be as nearly prohibitory as possible. An amount of duties should be collected from the smallest number of articles that will furnish an amount sufficient to pay the expenses of the General Government of our country. This would relieve our people from all internal taxation for the support of our National Government.

Mr. Bonamy Price, in his book on political economy, quotes from Hon. Ward, M. P., where he says that 99 per cent. of the communications on the tariff represent individual interests and demand protection for articles they produce. Mr. Ward, Bonamy Price, and all the advocates of unqualified free trade, base their arguments on a false foundation; they fail to see that our government has allowed local banks to issue pictures or bills of credit, called money, in open violation of the Constitution, which delegates only to Congress the power of coining money and regulating the value thereof; also of regulating commerce between the United States and foreign countries.

Our government having neglected from its commencement to make necessary and proper laws to issue a strictly national currency, based on the whole property of the country, and to establish a tariff only to raise a revenue sufficient to pay the national debt, should even now begin to assert that power and carry it out to the letter; for it is yet time to do right, correct errors, and to secure full and complete protection to the useful industries and labor now employed in all the important manufacturing interests of our country; but there seems to be little hope of establishing justice when our late Congress authorized the collection and accumulation of \$150,000,000, which they tried very hard to squander without much thought of appropriating any and all surplus toward paying our enormous debt, which would not only relieve taxpayers and producers, but the toiling masses.

History could probably not show such another accumulation of revenue in any other country, ancient or modern, monarchy or republic, and any nation or people that allows it is on the high road to corruption and ruin.

I indulge the hope that the all-important questions of a national tariff, and of a strictly national paper currency, will be settled in the interest of the mass of the American people, and not, as now, in favor of monopolies of all kinds, especially banks and railroads.

I desire also to call the attention of the Commission to a few facts and figures in relation to the exports and imports of merchandise, and of gold and silver coin and bullion, during the last twenty-three years, and the influence our foreign commerce has on the volume of currency, and the relation of that volume to the industries of the country. These facts and figures should convince every intelligent man that to disturb our present tariff, especially in the way of reductions of duties on foreign imports, will be attended with great danger to the business prosperity of our own country.

From the preliminary report of the Chief of the Bureau of Statistics, published in the Bankers' Magazine for September, we obtain some important facts in relation to the value of gold and silver coin and bullion imported into, and exported from, the United States from the year 1860 to 1882, inclusive; also, of the excess of imports over exports. The total exports of coin during this period was \$932,226,125, and the total imports only \$183,608,572.

During this period the exports of coin and bullion exceeded the imports for twenty years, and the imports exceeded the exports only for three years, and the total amount of exports of gold and silver coin and bullion over the imports in twenty-three years was \$749,617,553.

During this entire period we have been under a high tariff, and a portion of the time a war tariff at that. If we have lost \$749,617,553 of gold and silver coin and bullion, which constitutes the base of our currency, under a high tariff, what would have been our loss had we been under a system of free trade, or even with any great reduction in our present rates of duties on foreign imports.

We learn, also, from this report that in the year 1881 the total exports of the country were \$902,377,346, and the imports were \$642,664,628, and the excess of exports over imports was \$259,712,718; but, in 1882, the total exports were only \$750,351,173, and the total imports were \$724,623,317, leaving the excess of exports over imports only \$25,727,856.

From these figures it will be seen that the increase in our imports during the past year has been \$91,958,689, or 12.7 per cent.; and that there has been a falling off in our exports in the year 1882, amounting to \$132,026,173, over those of 1881, an actual change in the balance of trade of \$233,684,862.

Now if such an enormous change is taking place in one year under a system of what may be called a high tariff, what, may I ask, would be the result if an effort was made to reduce the rates of duties?

The report of the Chief of Bureau of Statistics also informs us that, out of \$91,958,689 of increase in imports during the past year, \$69,809,869 were dutiable articles, and the balance on articles admitted free of duty.

From the above table, in relation to the exports and imports of gold and silver coin and bullion, it will be seen that in the fiscal year ending in 1882 the exports over imports were \$6,940,186. You will also observe from the foregoing table, that in 1881 the excess of imports over exports of coin was \$91,168,650. This shows that in 1881 we had coming into the country a balance of over \$91,000,000 of gold and silver coin and bullion, while in 1882 we have had \$6,940,186 going out of the country.

Your honorable Commission must be aware of the disastrous influence upon the business industries of our country that a reduction of the

volume of our currency always produces. To contract the currency always tends to shrink prices. If you take away the gold and silver coin and bullion, you take away the foundation upon which all other currency rests.

We have over \$700,000,000 of paper currency that is practically redeemable in coin. If any great amount of this coin is taken out of the country, will it not endanger the ability of the government and the banks to redeem this currency in coin, and be likely to precipitate a financial panic?

These facts should make your honorable Commission hesitate long before you make any alteration whatever in our present system of tariff.

THOMAS HICKSON.

NEW YORK, *October 5, 1882.*

The following communication from Mr. THOMAS HICKSON, secretary of the committee on the tariff of the Goldbeaters' Union of New York City, in regard to the duty on gold-leaf, was read and ordered printed:

We respectfully ask your consideration of the following facts relating to the gold-leaf trade, which have come to hand since we appeared before your honorable board:

In 1879, after the long period of dullness that followed the panic of 1873, we obtained a considerable advance in our wages, which we held until the spring of the present year, when our employers told us they could not afford to pay the advance any longer, as the imported leaf could be sold in this country for less than it cost to make here, and the importers were taking away their customers. It cost, then, \$6.73 to make a pack of gold-leaf here, which is now made for \$6.40, while the foreign leaf can be imported, all charges paid, for \$6.42 per pack; and we are informed, upon good authority, that the German manufacturers are willing to sell at even lower figures, hoping to drive the domestic manufacturers out of the market and make up in the future what they may sacrifice now.

In proof of our statements we submit the following facts taken from the report of the Bureau of Statistics for the current year.

In the year ended June 30, 1879, there were only 214 packs of gold-leaf imported into this country; the next year, when we were getting advanced wages, the amount was nearly double, viz, 416 packs, while in 1881 it jumped to 2,252 packs, and in 1882, we are informed by Collector Robertson, that there were imported into New York alone 4,592 packs! These figures are unanswerable; they point to the conclusion that the duty must be increased or the trade will pass into the hands of the importers, and the only interest thus benefited will be that of a few non-producers, at the expense of the living of hundreds of deserving mechanics. We must, of course, admit that when our employers suggested the reduction we were not aware of the precise extent of the importation, but we knew they were losing customers, and we were obliged to accept the present rate of wages, averaging, as I have stated in the blank furnished by you, about \$432 a year, hoping that we should soon be able to better our position.

In order to ascertain the opinion of the consumers in this matter, we have spoken with several large manufacturers who use gold-leaf, and they all say that it is not like an article of every-day consumption, which people would use in larger quantities if it were made cheaper, but that a slight increase of cost, such as is proposed by us, would not interfere with its sale in the least, and they do not believe that if it were made 20 per cent. cheaper its use would be increased by one pack a year.

We appeal to you, not as men desiring a better return for invested capital, but as hard-working mechanics who are seeking such protection for our labor as will enable us to live by it as other men do whose position in life is similar to ours.

BENJAMIN TATHUM.

NEW YORK, *October 5, 1882.*

Mr. BENJAMIN TATHUM, of New York City, manufacturer of lead pipe, &c., addressed the Commission as follows:

I shall detain you but a very few minutes. A meeting was held yesterday by the representatives of the manufacturers in order to respond to your invitation to appear before you and present our case. Mr. Howe and myself were appointed to express, in general terms, the opinion of this meeting, that it was desirable to have free trade on raw materials and a moderate duty on manufactured articles. I appear before you in obedience to the request of these gentlemen. I have this morning endeavored to carry out their suggestions, and have committed to writing a few remarks which, with your permission, I will read.

Among the declared objects of the Constitution of the United States we find two which bear on the question of tariff. The first is "to establish justice; the other "to promote the general welfare." (See preamble.)

To this end Congress is empowered—

1st. "To lay and collect taxes, duties, imposts, and excises; to pay debts, and provide for the common defense and general welfare of the United States"; and,

2d. "To regulate commerce with foreign nations and among the several States, &c."

The general welfare requires that, so far as possible, the duties on foreign goods shall be arranged with the view of their effects on the whole nation, so as to develop the resources and the national wealth, stimulate and reward the industry of the people, and secure their prosperity. These objects also concern the common defense in the means which they would contribute.

Whatever stimulates the productive industry of the whole people tends to the general welfare.

It makes no difference to the tax-payer whether he pays a given amount by direct taxation or by indirect, provided such amount goes into the public treasury, or adds proportionately to the general wealth.

The great problem to be solved is as to the raising of a sufficient revenue for all the obligations and duties of the government from the resources and industry of the people, without injustice to any class or to any section of the country.

The various conflicting interests which have been urged upon Congress in reference to the tariff clearly indicate that it must, to be permanent, be arranged and settled on some general principle which will commend itself to general approbation. The subject is so complicated and the interests involved are so vast that we cannot expect to accomplish this object without full information, great care, and sound judgment.

The absurdities and wrongs which are seen and felt in the present tariff call for immediate changes in those respects. Amongst these are the duties which are prohibitory, which raise the cost of materials to the consumer, and yet add no revenue to the public treasury. Amongst these are the existing duties upon copper, and lead, and steel.

How does the present tariff upon these conduce to the general welfare?

We do not think that the people of the United States are prepared for a tariff for revenue only, irrespective of its effects upon the national industry. If not, and if the revenue of the country is to be raised chiefly from duties upon foreign manufactures imported and consumed here, then they should be made as nearly uniform as possible.

Duties on raw material—articles which are necessary to use to meet the competition of foreign commerce—should be admitted free. There is no adequate object in levying duties on foreign ores, because the value of our own ores will depend upon the price of the metal derived from them. Home competition secures this result. The silver and gold in our ores will cause them to be mined for the sake of the gold and silver.

The present duty on foreign pig lead is 2 cents per pound—\$40 a ton! And yet no revenue is derived from it! The cost of manufactured lead to the consumer in the United States is increased, apparently to millions of dollars, without producing any revenue to the public treasury. Who then gets the benefit of this great increase?

If the duty on pig lead were fixed at 1 cent per pound, then, on principles of equity, the duty on manufactured lead should be as much more, say 2 cents per pound. But both of these may appear to some excessive, and yet many believe that they ought to be arranged at a less tariff.

Experience shows that in many cases the increase or decrease of duties do not, to that extent, increase or decrease the price of foreign goods to the consumer.

Such changes generally increase or decrease prices in foreign countries, and, to nearly the same extent, increase or decrease the price to the consumer where such changes are made. The increased demand for foreign goods increases their price abroad at the same time that a decrease of the duty reduces the cost to the consumer, so that the change is generally met half way.

If the duty were taken off pig lead the price of foreign pig lead would probably advance 1 cent per pound at the same time that the price of pig lead in this country would fall 1 cent per pound. In such case the price of lead in Europe and on the seaboard of the United States would be very nearly equal. The present price is about 5 cents per pound here, whilst in Europe it is about 3 cents per pound. If admitted free the price of pig lead here and there would probably be about 4 cents per pound.

Home manufacturers would then obtain their supplies of pig lead at about the same price as the foreign manufacturers, and the competition would lie between the cost of labor and the skill of the manufacturer in the respective countries. There would, in such case, be no revenue derived from imported lead.

From past experience it is probable that from a duty of three-fourths of a cent per pound on foreign lead, with full drawback upon an equal weight exported to foreign countries, our foreign commerce would be increased, and the general welfare of the people of the United States would be best secured, at least until the public debt shall be extinguished.

Specific duties properly adjusted encourage the purchase of the best foreign goods, whilst ad valorem duties always tempt importers to purchase articles of inferior quality to the injury of the consumer.

I have been requested to present the following paper for your consideration:

The duty on raw material should be consistent. We allude to the prohibitory duty on lead ore (virtually a duty on the import of the pre-

cious metals), while iron ore, for example, is only 20 per cent. ad valorem, which is equal to a specific rate of less than 50 cents per ton.

Custom-house valuation at \$2 per ton, equal 40 cents per ton duty, whilst lead ores, without regard to per cent. of metal, are subject to a duty of 1½ cents per pound. See the contrast.—(Marquette Mining Journal.)

On lead ore, at the best established smelters, there is an average loss of 10 per cent. of the metal in reduction, which would make the duty on a fifty per cent. ore equal to \$74.67, viz, 2,240 pounds ore of 50 per cent., metal=1,120 pounds metal; loss in smelting, 10 per cent.,=112 pounds, leaving 1,008 pounds of metal, at 1½ cents per pound, on 2,240 pounds of ore (\$33.60),=\$74.67 on a ton of metal,=3.33 per pound.

On an ore of 75 per cent. we have 1,680 pounds metal. Loss in smelting, 10 per cent., 168 pounds, leaving 1,512 pounds,=to \$49.72 on a ton of metal,=to 2.22 cents per pound on the ore.

In another light, looking at the goods manufactured from ores of iron, and from ores of lead, and we have, viz:

Iron ore.—Valuation at \$2, duty 20 per cent.=40 cents per ton.

Rolled iron, at 4 cents per pound=per ton \$89.60; duty as above of 40 cents=.45 of 1 per cent. on the market value of manufactured iron.

Lead ore.—Duty 1½ cents per pound=\$33.60 per ton.

Pig lead.—Say at 5 cents per pound=per ton \$112; duty as above is equal to 30 per cent., or nearly 70 times more duty on lead ores than iron ores, calculated on the market values of their respective products.

Being freed from this excessive and prohibitory duty, the coal producer, freighters by land and water, insurance companies, employment of capital—with the accruing profits retained at home, well-paid labor in the transmission of the crude materials into the finished product, &c., all would be benefited.

It would enable us to compete with England and the continent for sheet lead, lead pipe, leaded iron plates, solder, and the alloys of lead, for the metal trade with the East Indies, now monopolized by England, and the white-lead trade of the world outside of the United States—all of which has been sealed against our manufacturers by the reason of the prohibitory duty on the raw material working against our own people, and for the benefit of foreign labor and capital, at the same time yielding no revenue to the government.

Imported into England from Spain in 1880:

2,562 tons of ore with about	17,934 ounces of silver.
67,584 tons of lead with about	662,323 ounces of silver.
70.146 tons	680,257 ounces of silver.

Relief is asked by making the duty the same per ton as iron ore in lieu of \$33.60; or at the extreme, not to exceed one-fourth cent per pound on lead ore. When an ore contains of the precious metals gold and silver more in value than the lead, then the ore should be classed amongst the precious metals and be on the free list.

For example, say lead is worth 5 cents per pound, and the ore contains 75 per cent. of lead, then the lead in a ton of ore is of value \$84. If the ore contains gold and silver—one or both—of value less than \$84, it shall be classed as lead ore. If more in value, then it shall be classed amongst the precious metals. This is in accordance with the present ruling of the government.

A case in point.

There was imported into Philadelphia, in 1879, an article of soda, viz:

	Per cent.
Hydrate of soda	42
Carbonate.....	23
Sulphate	35

The government ruled that the duty should be as caustic soda, 1½ cents per pound, that being the most valuable ingredient.

In the importation of caustic ash, testing as high as 14 per cent. caustic soda, the rate of duty is one-fourth cent per pound, it being the duty on carbonate of soda (soda ash), and being the most valuable ingredient, viz:

14 caustic, at ¾ cents	\$0 45½
86 ash, at ¼ cents	1 29

ON THE DRAWBACK OF LEAD DUTY.

In addition to the considerations submitted in the statement relative to the existing duties upon lead ores, the provision respecting drawbacks of duty upon foreign goods exported from the United States after being manufactured, merits the attention of Congress. The drawback system was adopted to enable manufacturers to import and manufacture foreign materials for foreign commerce on as favorable terms as other nations without diminishing the revenue derived upon duties on foreign goods consumed at home. The object was to secure employment for American industry, which otherwise would be prohibited or driven away to foreign countries by our revenue system without the slightest benefit to the people of the United States. This object has been in great measure defeated by the provision which withholds 10 per cent. of the duties levied upon such articles, when the duties upon them amount to from 50 to 100 per cent.; the amount thus withheld, in addition to the custom-house charges and other expenses, is a prohibitory premium given by Congress in favor of foreign manufacturers, and against those of our own country. The effect is to injure or altogether destroy our foreign commerce in such articles, and to that extent to take the bread from the mouths of our industrious citizens.

It is difficult to understand the object of levying any duty upon articles brought to this country and then exported.

The revenue derived from them does not pay the cost of collecting. The parties concerned pay all the expenses. The business does not in any way injure or interfere with the interests of any of the people of the United States, whilst the money value derived from it would be brought into the country, and, by increasing the taxable property of our citizens, would to that extent diminish the rate of general taxation. Articles produced in this country which command higher prices than foreign goods cannot be used for foreign commerce, and therefore the policy which prohibits the use of foreign goods for that purpose and deprives our citizens of remunerative employment without benefit to any American interest, can only be described as the dog-in-the-manger policy!

The energy and ability which exist in every man form part of the undeveloped wealth of the nation. If not employed it is lost. He who gives remunerative employment to that energy and ability is a benefactor to his country and adds to its wealth and ought to be encouraged in every way and every unnecessary obstacle to his success should be promptly removed. The system of drawbacks should be carried out so as to relieve our foreign commerce as far as possible from the evils

which arise from our tariff system. Articles made of foreign goods for export should, upon exportation, have the whole amount of duty refunded; and no fees nor charges of any kind should be imposed upon them. They are equivalent to export duties which are prohibited by the Constitution. We should encourage and foster our foreign commerce by liberal provisions by which the amount levied upon foreign materials may be returned upon the export of the same quantity of such materials when manufactured irrespective of their origin. Thus a party who pays duty upon a given quantity of foreign steel, iron, copper, lead, or other materials which in its manufacture into articles for export is liable to become or is necessarily mixed with similar materials produced in the United States, should, upon export of the same quantity of such material, be entitled to the amount of duty which he shall have paid upon the imported material. Such substitution of material would work no injury to the public revenue.

PETITION OF AMERICAN ARTISTS.

NEW YORK, *October 5, 1882.*

The following petition from AMERICAN ARTISTS resident abroad, transmitted through the Secretary of State, in regard to the duty upon works of art, was ordered to be printed :

We beg to present the following petition on behalf of American artists resident abroad, in reference to the new consular regulations relating to duties on the works of American artists when sent to America.

Our reasons for desiring a revision of the laws now in force are as follows :

I. By the old consular regulations, under the head of "tariff of fees" there were no special instructions as to the amount to be paid by American artists for certificates to enable them to have their productions entered free of duty in United States ports, but it was the custom in some of the consulates, for instance that of Munich, to charge 50 cents for each oath for such purpose. By the new consular regulations of 1881, however, section 675 reads as follows :

The statute (Revised Statutes, section 2505) provides for the entry at ports of the United States free of duty, of paintings, statuary, fountains, and other works of art, the production of American artists. The fact of such productions being the works of American artists must be verified by the certificate of a consul or minister, indorsed upon the written declaration of the artist; the charges for said certificate being \$2.50.

II. But, further, by the actual existing laws, when an American artist residing abroad wishes to send his picture to America, he must pay not only \$2.50 for the certificate, but also an additional \$2.50 for the invoice. These charges we think are excessive and exorbitant; they fall heavily upon those whose studies we think the government should foster and encourage.

III. We would, furthermore, beg to call your attention to the existing law regarding frames upon the works of American artists. Under the present law an artist is obliged to pay a duty of 35 per cent. on the value of his frame, which effectually prevents him from sending his picture to America framed. This we consider not only detrimental to his artistic interests, but injurious to the cause of art.

A frame designed or chosen by the artist is actually part of the picture. No picture is finished until framed, and that under the artist's own supervision and care. Pictures being painted in the frame, that frame belongs to and is a part of the picture, as much as the paint with which the picture is painted. In order to enable the artist to finish his picture properly, he must know that the frame in which it is painted will always remain a part thereof.

We therefore beg for such a revision of duties as will enable American artists to send their works framed to America entirely free of duty.

LUMBER DEALERS' STATEMENT.

NEW YORK, *October 5, 1882.*

The following statement in regard to the duty upon lumber, signed by the principal wholesale lumber dealers of Chicago, Ill., was ordered to be printed :

The Forty-seventh Congress having authorized the appointment of a Commission for the purpose of gaining information directly from the people upon the subject of the present tariff, the gentlemen comprising the said Commission, as we understand the scope of their duties, intending to recommend to Congress amendments to the tariff law, when it shall appear to them from good evidence that the people of the United States will be benefited by such changes, we believe most earnestly that the time has come when it would be greatly to the interest and good of the people of the United States to remove the present import tax upon lumber, which may conveniently be brought to them from the Dominion of Canada. In support of this argument we would say that the wonderful growth of the United States, and especially the development of that portion lying west of the lakes, has been due to the readiness with which cheap dwellings, barns, fences, and granaries were obtainable through the plentifulness of a cheap building material, such as is found in the white-pine lumber supply. With the exhaustion of this supply the still vast unsettled prairies and fields of the West will, in a measure, cease to present inducements to the emigrant from foreign lands, the unoccupied overflow from the older States of the Union, or the inducements for development afforded by the building of railroads and other highways of commerce.

That the time is not far distant when the lumber supply of the Northwest will be practically exhausted, and that evidences of that exhaustion are even now quite apparent, will be disputed by no well-informed person.

It is but a few years since the value of standing pine of good quality averaged from as low as 50 cents to as high as \$2.50 per thousand feet; the value of the same grades of timber has risen at the present time from \$3 to as high as \$8 per thousand feet, an average value being, probably, fairly stated at from \$4 to \$5 per thousand. This value is still further advanced to the consumer in the fact that a majority of the present timber supply is remote from streams, and consequently more expensive of access.

The efforts of the United States census commissioners to ascertain the extent of the timber supply of the United States have resulted in a report, under the sanction and approval of that bureau, placing the timber supply of the three principal pine-producing States at but 81,000,000,000 feet, or an amount equal to the demands of the country for a period of eight years, based upon the present consumptive demand. Aside from the States of Michigan, Wisconsin, and Minnesota, the white-pine timber resources of the country are insignificant, and while the supply of other kinds of timber in the South and elsewhere is reported as adequate for the needs of a full generation, there is no other variety of timber which can take the place of or is adapted to the same uses as white pine, unless it be the cypress of the South, unavailable for many eco-

nomie reasons, or the whitewood (or tulip), more valuable for other commercial uses than as a substitute for pine as a building material.

Aside from the supply of white pine in the three States above mentioned, in the Dominion of Canada there exists a quantity equal, according to the opinion of many experts who have considered the question, to the present remaining supply of the United States. We believe that it is in the interest of a good and wise policy to admit this timber to the United States free from the incumbrance of a tax. We assert that this timber has cost, and does cost, those who control it for utilization a larger sum per thousand than was obtained by the United States Government from those to whom the timber lands of this country were disposed; that the cost of manufacture in Canada is not below the cost to the American manufacturer; and that the average cost of transportation of a majority of that portion of the present Canadian pine which would naturally reach the United States market is considerably in excess of the cost of placing the native product in the hands of the consumer. These combined factors preclude the possibility of any injury resulting to the American manufacturer from the admission of foreign lumber.

In support of the first proposition we assert that the liberal policy of the American Government has permitted the timber lands of this country to be purchased in fee simple at from \$1.25 to \$2.50 per acre. These lands are estimated in general to yield 5,000 feet of timber per acre, while a large proportion of them have and will yield from 10,000 to 15,000 feet per acre. The standing timber, therefore, has been sold by the government at an average probably less than 25 cents per thousand feet, including the ownership of the land, which in many cases readily sells at from \$5 to \$10 per acre after being denuded of its timber, such land being found in many parts of Michigan, Wisconsin, and Minnesota to be unsurpassed in value for agricultural purposes. From the land and timber for which the government has received, at its highest established price, \$1,600 per square mile, the manufacturer of lumber has realized, and is now realizing, 3,200,000 feet of timber of an average stumpage value at the present time, as stated by the Saginaw manufacturers in an address recently presented to the Congressional Special Tariff Commission, of \$4.50 per thousand, or \$14,400 per square mile, to which may be added the market value of the land for agricultural purposes, which, if stated at \$2.50 per acre, or \$1,600, leaves the case to be stated simply that the government has presented \$14,400 in timber to each purchaser of a square mile of timber lands. This we esteem to be fully all the protection to which the manufacturer of the United States is entitled at the hands of the government.

Comparing the policy of the American Government with that of Canada, we find that it is the policy of the latter to place its timber lands in groups of townships, which are offered to the highest bidder at public sale, at a bonus for the privilege of cutting off the timber. This bonus or privilege usually costs the purchaser not far from 35 cents per thousand feet, after which, under many and usually expensive restrictions, the government claims a stumpage duty of 75 cents per thousand on all timber actually cut, in addition to local taxes of about \$100 per year per square mile, or an average of about three cents per thousand feet, a total stumpage cost of over \$1 per thousand paid to the Canadian Government, the ownership of the land remaining in the government.

While, therefore, the American timber owner, investing of necessity but \$1,600 to secure 3,200,000 feet of timber (actually securing nearly or quite double that amount as a rule), realizes from the value of his

timber and the sale of his land \$16,000, the purchaser of Canadian timber pays to the government not less than \$3,200, without any rebate, in the value of the land, for the purpose of securing the net quantity of 3,200,000 feet of timber. The Canadian lumberman, in a country less favorably situated for railroad transportation of men and supplies to the camps, is consequently at greater expense in his preparatory work, and as the contiguity of the two nations enables a ready interchange of labor, it follows that with a larger number of laborers, bred to the work of the lumber camp, the Canadian laborer seeks work on American soil whenever the rate of wages between the two countries is greatly disproportioned, thus compelling the Canadian employer to pay nearly or quite as high rates of wages as prevail in the more extended lumber regions of this country, if he would retain his laborers.

The food markets of Canada are based in values upon those of the United States, so that in the staples which enter most largely into the business of lumbering, namely, grain for teams, flour, beef, pork and beans for the men, the average expense of camp supplies is to the Canadian operator but little if at all less than to the American. In the running of logs to the saw-mill the expenses again are not far from equal, the general comparison of streams in the two countries being, if anything, in favor of the American.

The capital invested of necessity in pursuit of this industry is greater in Canada in proportion to the extent of the work performed, from the necessity to acquire the large land limits, which alone can be obtained from the Canadian Government, the American Government selling as low as 40 acres at a cost of not over \$100, while nothing less than a township is disposed of by the Canadian Government. The number of men employed is not less, per thousand feet produced, in one country than in the other, and the capital employed in saw-mills will bear the same comparison. It would be folly to assert that greater intelligence enables the Canadian laborer to perform a greater amount of work in the saw-mill than does the American, while it is a fact that by improved methods and machinery, more generally adopted in this country than in Canada, the cost of producing lumber is greater in Canada than in the United States. In the matter of transportation the Canadian again labors under the disadvantage of being, in the main, and especially in the western portion of the province, whence must come a majority of the timber, at a long distance from markets, whereas the American operator can utilize lake or railroad transportation at his pleasure, and with but short lines and a low freight rate. The disadvantages under which the Canadian operator labors we assert to be more than the equivalent of any superior advantages he may possess, so that it may with positiveness be assumed that Canadian lumber laid down upon the docks of Chicago or any other large distributing center, will have cost the Canadian as much, if not more, than the same quality of stock has cost the American manufacturer at the same point.

Having demonstrated, as we believe, that the American Government has dealt more liberally with the American timber owner than has the Canadian, pointing to the statement of the Saginaw manufacturers, before referred to, in which by their own admission the royalty on Canadian timber is \$1.75, or nearly double what we have assumed it to be, as further evidence that our estimates are wholly within bounds, we next controvert the statement of the Saginaw memorial, in which the liberality of the Canadian Government in building piers, booms, and slides is pointed out, by referring to the general policy of the American Government with regard to navigable waters, pointing to the recent river

and harbor bill, appropriating an additional \$17,500,000, no mean proportion of which was devoted exclusively to improvements in the localities where the lumber interest is benefited to a greater extent than is any other individual industry.

Analyzing the statement of the Saginaw memorialists, we have shown that while the Canadian lumberman has paid to that government from \$1 to \$2 per thousand stumpage on the timber cut by him, the American Government has virtually presented to the lumberman of this country each section of pine land, together with the timber on the same, of a value of \$14,400, for the mere nominal sum of \$1,600, or, as he can readily realize that sum for the stripped lands, has made him a gift of the timber for his labor in clearing it. The Census Bureau reports 1,649 lumber-manufacturing establishments in Michigan, 234 in Minnesota, and 704 in Wisconsin, a total of 2,587; assuming for argument's sake that the number is 10,000, and asserting, as we believe, that no timber interests except those connected with the lumber manufacturers of the States named are to be affected by an abrogation of the tax on lumber, it would seem that after giving \$14,400 with each section of pine land to 10,000 manufacturers of lumber, it was now the duty of the government to consider the interests of the consumers of lumber, represented by over 5,000,000 persons to each 1,000 manufacturers.

These have a right to claim that the timber which has been donated to the manufacturers by the government shall be provided for their use at a reasonable modicum of profit to the manufacturer. With a yearly destruction of the forests, the timber donated by the government to the manufacturer has risen in value, until it is no uncommon thing to hear of sales of standing timber at the rate of \$8 and \$10 per thousand stumpage, while the average price, as stated by the Saginaw lumbermen, is not far from \$4.50. The average price in 1870 was below \$1 per thousand. The consumer has been compelled to pay this difference, and if values advance in the same proportion during the present decade, he will be called upon to pay to the manufacturer not less than \$20 per thousand stumpage on the timber donated by the government.

When we consider that the annual manufacture of lumber in the three States mentioned exceeds 8,000,000,000 feet, and that this slaughter of the home forests means the destruction of 2,500 square miles of timber each year, and at this rate that there is but an eight years' supply to draw from, it would seem the part of prudence to begin to purchase some portion of our supply from those who have it for sale, before the time when absolute want shall force us to buy it at the sellers' asking price.

Some gentlemen claim that there are climatic considerations that have a bearing upon this subject—that the destruction of our forests will affect unfavorably the productive force of our soil; this branch of the subject we leave with those persons interested in agriculture.

The Saginaw committee claim that the settlers, by crowding in upon their pine lands to make their clearings for farming purposes, destroy by fire all their pine forests, and for relief desire to cut off the trees as rapidly as possible, so as to save them. We seriously question this statement, not believing that the average thrifty farmer seeks the pine belt in pursuit of his occupation, but from our own knowledge believe that the forest fires are in the main brought about in consequence of the accumulation of the limbs, bark, and chips that become dry and easily ignited shortly after escaping from the lumberman's ax. Hence we should say that a good way to preserve forests from fire would be to stop filling them with bonfire materials.

The Saginaw memorialists say: "When our government can furnish lands on such easy terms as does that of Canada, free trade in lumber might be nearer just." Having shown that our government has been more liberal to the lumber manufacturer than to any other class of our citizens, and vastly more so than has the Canadian Government to its manufacturers, and having demonstrated that the cost of lumber to the Canadian producer precludes any possible danger of his entering into ruinous competition with the American manufacturer, we respectfully submit that the short supply of native stock, and the growing demands of a mighty nation, the interests of 55,000,000 people in cheap homes, and manufacturing industries needing the consumption of pine lumber, imperatively demand that all restrictions should be removed from the importation of that limited quantity which the Dominion of Canada can supply to supplement our rapidly decreasing timber resources.

For the above reasons, and many others that might be given, we must earnestly pray that all duty upon pine lumber, lath, and shingles may be removed, to the end that the people of the United States and particularly of the States and Territories to the west of us, may improve the rich prairies, and at moderate expense construct their buildings and homes from the products of the forests of Canada, as similar material grown in the United States has become so nearly exhausted and cannot be reproduced.

O. B. SMITH.

NEW YORK, October 5, 1882.

The following supplementary statement submitted by Mr. O. B. SMITH, of the firm of J. Lee Smith & Co., of New York, in regard to the duty upon paints and oils, was ordered to be printed:

Present tariff designation or commercial name of article.	Present rate of duty.	Proposed rate of duty.	Estimated total amount of reduction of duty (per annum).	Estimated total amount of increase of duty (per annum).	Reasons for proposed changes, and remarks.
Barytes, sulphate of, crude	20 per cent.....	\$5 per ton.....	\$7, 000	Found in abundance in this country; would be a protection of about 80 per cent.
Barytes, sulphate of, powdered	$\frac{1}{2}$ cent per pound.....	do	5, 000	Would be a protection of about 30 per cent.
Bone-black, powdered or in pulp	25 per cent.....	10 per cent.....	Nominal.	Used mostly by wall-paper manufacturers.
Carmine, dry, in oil, or in pulp	35 per cent.....	\$1 per pound.....	Nominal.	
China clay	\$5 per ton.....	\$1.75 per ton.....	\$15, 000	See argument of August 4, 1882; the increased consumption would make about this loss of duty.
Colcothar, dry, or oxide of iron.....	If pure, free; if impure, 25 per cent.....	If commercially pure, free.....	Nominal.	The foregoing disputed interpretation of the law now in suit.
Lead, red, dry or in oil	3 cents per pound.....	1 cent per pound.....	40, 000	See argument of August 4, 1882, before the Tariff Commission, of O. B. Smith.
Lead, white, dry or in oil	do	$1\frac{1}{2}$ cent per pound.....	200, 000	Do.
Litharge, dry or in oil	do	1 cent per pound.....	50, 000	Do.
Ocher and ochery earth	$\frac{1}{2}$ cent per pound.....	Free	\$30, 000	Do.
Oil, linseed	30 cents per gallon.....	15 cents per gallon.....	15, 000	Do.
Paris white	1 cent per pound.....	$\frac{1}{2}$ cent per pound.....	1, 000	Do.
Prussian blue	30 per cent.....	5 cents per pound.....	5, 000	Used mostly for painting petroleum barrels for export.
Sienna earth	$\frac{1}{2}$ cent per pound.....	Free	5, 000	Not found in this country, except of inferior qualities.
Ultramarine blue.....	6 cents per pound.....	4 cents per pound.....	Nominal.	Used mostly by calico and paper manufacturers; increased consumption would offset rebate in duty.
Umber, dry	$\frac{1}{2}$ cent per pound.....	Free.....	\$10, 000	Not found in this country of sufficient good quality for manufacturing purposes.
Venetian red	25 per cent.....	do	10, 000	See argument of August 4, 1882, before the Tariff Commission, of O. B. Smith.
Whiting, dry	1 cent per pound.....	$\frac{1}{2}$ cent per pound.....	28, 000	Do.
Zinc, oxide, dry or in oil.....	$1\frac{1}{2}$ cent per pound.....	1 cent per pound.....	Nominal.	Foreign cost greater than home product; used by rubber manufacturers largely.
All other paints, not otherwise provided for, dry, in oil, or in pulp.	Various	25 per cent.....	Nominal.	
			70, 000	351, 000	

JAMES M'CREERY ET AL.

NEW YORK, *October 5, 1882.*

Mr. JAMES M'CREERY, representing a committee of New York merchants, addressed the Commission in regard to the propriety of substituting specific for ad valorem duties, as follows:

I am one of a committee appointed to give the Commission the views of the dry goods merchants in this city in regard to the method of assessing the duties on articles imported through the custom-house. I suppose it is a matter of public notoriety that the importing of foreign manufactured goods, particularly those that pay a high ad valorem duty, has fallen out of the hands of the American merchants in a great measure. The business is done now by foreign manufacturers through their agents here, and where 60 per cent. ad valorem duty, or something approaching to it, is attempted to be collected from these foreign goods, there is a premium given for undervaluation. You will admit that the gentlemen who are at present examining goods in the custom-house are men of experience and integrity, and apply themselves diligently to the discharge of their duties. I have been engaged in the dry goods business thirty-six years; twenty-nine years on my own account, and during that time have imported large quantities of goods. Yet I find it extremely difficult at the present time to tell within 10 or 15 per cent. what is the real value of fine goods. I go to Europe frequently, and spend two or three months at a time there purchasing goods, and yet I find it difficult to come any nearer than I have stated to the value of certain goods. We will say that the foreign manufacturer sends to the United States goods amounting to 4,000,000 or 5,000,000 francs, or 4,000,000 marks, or a million dollars in foreign value. If he undervalues those goods 10 per cent., it gives him an advantage over the American merchant of about \$60,000. He has an agency to maintain here for the sale of his goods, and such an agency cannot be established and maintained at less than a cost of \$10,000 to \$20,000 a year; but even then there is a clear bonus given by high ad valorem duties of from \$40,000 to \$50,000 on undervaluations.

I know a good many manufacturers in Europe.—reputable men—men of high standing, and they desire nothing better than to be placed upon the same footing in the American market with less scrupulous manufacturers. The American merchant desires no advantage over the foreign agent. He simply wishes to be placed upon the same footing. The foreign manufacturer, because of the high ad valorem duty, tries to produce an article with the best possible appearance, and having at the same time the least possible intrinsic value, the intrinsic value being the standard adopted at the custom-house, and the appearance being the quality which will give his goods ready sale. The result is, that large quantities of goods come to our market for which our people pay their money, such as silks, velvets, satins, plushes, &c., which are composed largely of drugs, gums, glucose, and even iron pyrites. Such goods cannot give satisfaction. Our government should, if it is a possible thing, protect our people from the importation of such goods as these, and I think any legislation which will result in reducing these high ad valorem duties will have a tendency to ameliorate this evil.

By Commissioner OLIVER:

Question. Do you attribute the evil you speak of to the effect of high ad valorem duties alone? would not high specific duties have the same effect?—Answer. This is what I mean. A duty of 10 or 15 per cent. does not leave a large enough margin for undervaluations.

Q. Then it is only a matter of degree. A man who will swear to a lie for a dollar might swear to a lie for ten cents.—A. But if the profit is so small, it will not enable him to maintain his agency. As American merchants we desire no advantage over any manufacturer's agent. All that we desire is to be placed on the same footing. If I am placed on the same footing with the foreign manufacturer and cannot maintain my position, then I deserve to lose it. I say *high* ad valorem duties, because low ad valorem duties will not pay the expense of establishing an agency here.

The mode I would propose for obviating these difficulties, and for protecting the American consumer from inferior goods as well as protecting the American merchant from unfair competition is this: that the duties upon all goods that now pay high ad valorem rates, as far as possible, should be made specific. What the rate of duty should be, whether higher or lower, I leave to the Commission and to Congress to decide; that is outside of our object in coming here to-day. Our purpose, however, is to have the rate of duty made so plain and so specific that every man—the foreign manufacturer, the American merchant, and the importers' agent—shall stand on an equal footing. I should do that by making the duty on goods known as silk in the piece, so much per pound for black silks, and so much per pound for colored silks. Or, if that seems too great a change, so much per pound for black silks with 10 or 15 per centum ad valorem added, or so much per pound for colored, with 10 or 15 per centum ad valorem added.

By Commissioner AMBLER:

Q. Would not that operate very inequitably as regards the cheaper grades of silks?—A. The cheaper grades of goods, if they are not loaded with dye stuffs, will weigh lighter than the better class.

Q. I inquire for information. The supposition of a great many gentlemen is, that the lower grades of goods weigh proportionately more as to their value, and to put on a lower grade of goods such a duty as you suggest would be a much higher rate than on the better class. I inquire as to the effect of it?—A. The main value of a piece of silk of that tight texture consists of the actual silk of which it is composed. The lighter the silk texture is the better quality of silk it is made of.

By Commissioner UNDERWOOD:

Q. How would that operate in regard to woolen goods?—A. That could be applied to all woolen goods.

Q. Do you think the coarser fabrics do not weigh more than the finer?—A. The coarser fabrics weigh more than the finer according to the quality of the wool; but you have not one rate of duty for wool now; even raw wool pays different rates of duty.

Q. I understand that; but your idea is to go by the pound. Now to take the manufactures of woolen goods and charge a duty by the pound, would not the coarser fabrics pay a much higher per cent. than the finer fabrics?—A. You cannot, by any specific rate of duty, do more injustice to the wearer of common goods than is done by the present tariff.

Commissioner UNDERWOOD. I might not differ with you in that opinion.

By the PRESIDENT :

Q Your remarks apply particularly to silk goods, I understand?—A. Yes, sir; to silks, satins, velvets, and plush goods composed partly of silk. And that leads me to say this: Some say that it would be impossible to put a specific rate of duty on coarse mixed articles composed of silk and wool, silk and cotton, or silk and jute. But I have seen an instrument, a square, which is put on a piece of goods, and by striking it with a mallet it cuts out a square, and the threads can be taken out of that square both ways, the cotton and the silk and the woolen threads, and put by themselves, and the exact proportion of each easily ascertained, and, by weighing the different kinds on a delicate machine, you ascertain exactly how many ounces or parts of ounces of each there are in a square yard, and by ascertaining the number of square yards you can ascertain the weight of the whole; and you can ascertain in this way the rate on the silk, on the wool, and on the cotton. There is no difficulty about it, except the matter of labor and calculation; it can easily be ascertained. I give you my word as an old merchant, and as a man enjoying, I hope, a fair reputation, that the changes which I propose to you will be warmly received not only by the merchants of America, and the consumers of foreign goods in America, but by the best class of foreign manufacturers. I have met myself in Europe during the present summer manufacturers who were in a state of continual anxiety lest other manufacturers less scrupulous, should value their productions at a lower rate of duty at our custom-house than they could conscientiously value theirs; and they desire nothing better than to be put on a footing with the less scrupulous of their fellow manufacturers.

Mr. EDWARD A. MORRISON, one of the same committee of merchants, said:

I would emphasize distinctly what Mr. McCreery has said in regard to our business. I am a merchant here in New York, and have been all my life. I have been in the habit of crossing to Europe twice a year. When I first crossed over, before men knew how I did business, the first question I would be asked there would be, "How do you want your invoices made out?" I always answered, "I want them made out according to their correct cost," and sometimes there was a little surprise manifested that an invoice should be made out exactly at the price the goods were sold for. But they soon learned how I wanted to do business, and made their invoices accordingly. The result of that custom has been, that we are not able to import many of these articles of which silk is a component material. The business seems to have passed into the hands of manufacturers on the other side, and their agents on this side, and their *modus operandi* is this: You go there and ask for their prices; you want the franc price or the sterling price, and they tell you, "We don't sell these goods in franc or sterling prices; we will sell them to you for so many dollars or cents, delivered through our agent in New York." So that the appraisers in the custom-house have no means of making an exact comparison of these goods with any goods sold to American merchants. Then again, our customs laws give them a leeway, so to speak, of 10 per cent. Unless an invoice is advanced by the government at least 10 per cent. there is no penalty. So that a manufacturer can say to himself, "I can undervalue my invoice 10 per cent., and if it is only raised 9.9 per cent. then I have no penalty whatever to pay; I am only compelled to pay the correct duty in any event, and can afford to undervalue my invoices 10 per cent. and escape all risk."

The silk business is a very large one, but, even taking a small amount, say a million dollars a year, if the foreign manufacturer succeeds in undervaluing 10 per cent., the duty being 60 per cent., he has saved \$60,000, and that is his profit. In other words, he can take our orders at what it costs us to import, and still make a profit out of the United States Government by this saving which he makes. And, gentlemen, it is almost impossible for any appraiser (I know this personally) so skillfully are these goods made, to tell the absolute value of the goods imported. As Mr. McCreery has said, they are filled with starch, and soap, so much so that in black silks you can take a 12 ounce silk and weight it up to 24 ounces, or perhaps more, a result which is very disastrous to the consumer. If any of you gentlemen go to buy a silk dress for your wife, when you take hold of it, if it feels pretty heavy, you may think it is a good article. But, take it home, and by the time the soap and starch is worn out of it, it is in slits and rags, and you wonder why it has worn so badly. So that I think our suggestions will be of benefit to the consumer, and for our protection as well. We desire to have every one stand on the same footing, and if the specific duty is to be made \$3 a pound on silk we will pay \$3 a pound. These men can enter a silk worth 8 francs for 7 francs, whereas we are obliged to enter it for 8 francs or the price we pay for it. It is consigned to them, and they simply swear that, to the best of their knowledge and belief, that is the market price of the silk; while we are obliged to swear to the exact price we pay for it. So that the whole tendency of this 60 per cent. ad valorem duty is to throw the business of this country in silks into the hands of the manufacturers on the other side and their agents here, and we claim that we should be placed on the same footing, and insist very strenuously on its being done, no matter whether the duty shall be \$2, \$3, or \$4 a pound. The government has skillful men employed as appraisers, and they can easily ascertain the correct rate of duty under the plan proposed, and the business could then be conducted on an equitable basis.

In regard to the question asked as to whether this will not tend to increase the duty on low-priced silks, I will say that perhaps it will. But I do not think that ought to be allowed to stand in the way of a fair and equitable duty towards all. I do not hesitate to say here, as I have said in the public stores to Colonel Ketchum, that this duty of 60 per cent. ad valorem cannot be collected.

By Commissioner AMBLER:

Question. As a matter of course, a slight increase might not furnish a reason for not adopting the plan you suggest; but, if the increase on the lower-priced goods was extremely in disparity with the rate that the higher-priced goods were paying, it would seem to me to furnish some reason why we should be careful, at least, in the adoption of your plan?—Answer. I do not think it would be in the extreme.

Q. I agree that if it can be properly done, your plan is an excellent one. But what would be the effect in that regard; what is your idea of the result of the adoption of such a plan? If, under a specific duty of so much a pound, medium qualities of silks were paying 50 per cent., what would the lower or higher priced qualities pay?—A. I could not tell you about the exact percentage; but I think I could say this: that it would not be extreme; I think the people generally would be gainers by it, and could then buy low-priced silks, which would be good silks and wear well. But these silks which are filled with gums, which are

weighted, and changed from 12 to 24 ounce silks, never will give any satisfaction, and persons who buy them throw away their money.

Q. This loading material is destructive to the silk, I understand?—

A. Yes, sir; it is.

Commissioner AMBLER. As I understand, the cheaper silks are the lighter weight silks usually?

Mr. M'CREERY. Yes, sir; if they are not charged. Mr. Constable proposes a certain ad valorem rate to be put upon piece silks; but we do not recommend any ad valorem rate whatever; we do not presume to do that. The fact, however, of your sitting here is a proof that the American people desire tariff reform. You are here for a specific purpose.

I have a silk factory which I carry on in the State of New Jersey, and I can speak from personal knowledge when I state that the American manufacturers can supply a much better low-priced article to the American public than the foreign manufacturers have been supplying under a high ad valorem duty.

Commissioner AMBLER. If we put the rate up so that it excludes the foreign article, you may raise your prices.

Mr. M'CREERY. No, sir; I think we shall be in the same condition very soon, if the 60 per cent. duty is maintained, that the woolen manufacturers are in now. They are better off now than they were some years ago.

Mr. MORRISON (resuming). Before leaving this point, gentlemen, I desire to say that I think it is the universal opinion of the merchants that what we need is a plain simple tariff that we can all understand. Not long ago I imported some small fans, about the length of your finger, and fans are particularly specified in the tariff, I think, as paying a duty of 35 per centum. Yet the appraiser told me that he had entered those fans at 50 per centum, because he said they were toys, and that I, being in the fancy goods business, should therefore pay a duty of 50 per centum, but if I had been in some other line of business, then I would only have had to pay 35 per centum. I thought it was the most extraordinary piece of reasoning I had ever heard of in my life. But the matter was such a small one that I let it go, and didn't bother about it. Recently I have had the privilege of paying a higher duty on some cashmere embroideries on wool. Unfortunately I cut my embroideries off the wool. They then declared that they were dress trimmings, saying that I was in the dress-trimming business and they would have to pay 50 cents a pound duty, and 50 per centum ad valorem; but if I had been in the upholstering business and they had been used for upholstering work, I should only have had to pay 35 per centum ad valorem and 50 cents a pound. In other words, I paid 15 per cent. more because I am a dress-trimmings manufacturer. If I had left it on the piece, had not cut it off, then I would have only paid 35 per cent. and 50 cents a pound. It seems to me that all these inequalities should be swept away, and that we should know exactly what we are about and what we have to pay for these goods. Another unfortunate thing about that entry: the appraiser stamped it as correct, and it was stamped correct by three of them, and I never received any notice that there were any additional charges to be paid until a month afterwards, when I got a notice that I had to pay \$502.40 additional. These goods unfortunately had been sold, based on the 35 per centum and 50 cents a pound duty, and I had no redress except I might have made trouble for this appraiser, and have gotten him out of his place, but as it would bring no dollars back to my pocket, I let the matter rest. Again, if I had paid

\$502 less than I should have paid, six years thereafter the United States Government, through its district attorney, might have come down on me for that amount. Whereas they only gave me ten days in which to file a protest if I desired to appeal against the decision, and not protesting within that time, I am shut out forever. It seems to me that the importer and the government ought to stand equally before the law in this respect; not give the importer only ten days to file a protest, while the government has six years to collect its bill. I speak of civil matters, of course, and not of criminal matters.

Another suggestion I would like to make is this; that we be allowed to swear to our entries before a notary public. We are obliged now to make a journey from our places of business, a long distance away, down to the custom-house, just to nod our heads to the deputy collector, and I do not see why that should be required. It takes me fully an hour and a quarter to go from my store down there and back just simply to do that. I simply take off my hat to him, never say a word, and he nods to me and scratches his name down upon my entry, and back I go in the stage. Whereas, if we swore before a notary public, we could transact the same business in five or ten minutes' time, and I do not see that the United States would suffer any chance of being defrauded if that was done.

In regard to disputes arising between the importers and the government, it seems to me that we ought to have some kind of court to determine these questions. If, for instance, we have a grievance in which the amount involved is, say, \$250, it is not worth our while to sue the United States Government for it, and we lose a good many sums of money in that way. As the law stands at present we must file a protest within ten days. Then there is a 30 days appeal to the collector, and, after he reports, we have 90 days given to us to prove our case. So that we cannot allow four or five cases to accumulate, which would make it worth while for us to employ a lawyer to attend to, and we have to let these matters go by default, simply because we cannot pay a retaining fee of \$250 to a lawyer in order to collect \$250 from the United States. It seems to me that we ought to have a court composed of five judges appointed for life, if necessary (if that is the best way to secure proper persons to fill such positions), and let all these questions go before such a court, where we may appear by ourselves, and have a chance to get redress. As the law now stands we have no such opportunity. When we protest against certain entries, that protest is sent to the Secretary of the Treasury, and he sends it back to the appraiser, and of course the appraiser confirms his own decision, and that is the end of it; so that we are appealing really to the very man who has already established the rate. That is the practical working of it. There should be a body of men, skilled in the business, before whom we could go and present our case.

There is another point, which I have already alluded to. Under the present tariff, worsted dress-trimmings pay a certain rate of duty; but it is almost impossible for anybody to say whether an article is to be used for dress-trimmings or for upholstery work. It seems to me that all these distinctions should be swept away, and the article assessed according to the material of which it is composed.

By Commissioner BOTELER:

Q. When an article was composed of wool and cotton, what would you do?—A. I would make a classification including wool and cotton goods. And that reminds me of another point—that there are certain duties on

goods which are ascertained in this manner. If the cotton is 25 per cent. in silk and cotton goods, then it pays 60 per cent. duty; if it is 24½ per cent. it pays 50 per cent. duty. Now, you take silk gimps, which is a cotton filling wound around with silk, and sewed into various forms, for trimming. If that part of the law is literally carried out, and I import fifty patterns of silk gimps, if the appraiser does his duty he has got to analyze every single one of those patterns, and I should have to get a special delivery, and leave him to examine these samples afterwards, or wait six weeks for my goods. It seems to me such things should be left out of any revised tariff, and whatever the chief value of the article is, it ought to be classed in such a way that it can be easily determined.

Commissioner AMBLER. That is, the rate should be on the component part of chief value.

The WITNESS. Yes, sir; whatever duty was put on silk, that should be the rate. Then we know what it will be. I got a refund on these very identical goods. They have made up their minds there is 25 per cent. of cotton in value, and they have refunded the difference between 50 and 60 per cent. duty. Heretofore, I had always paid 60 per cent. on them. I also think that the force in the public store should be increased. It would be a great convenience to the importers.

Commissioner AMBLER. That is a matter of regulation which could be easily settled.

The WITNESS. I know where men have waited sixteen and seventeen days for their goods, and I have waited 14 to 15 days for mine, and all the merchants will tell you the same story.

The last point I wish to make is in regard to the salaries of the appraisers. As business men we would pay higher salaries for men whom we consider fitted for these positions than they are now receiving from the government, and the question is whether it is to the interest of the government or the merchant that these men should be paid a less sum than the merchants would be willing to pay them for the same service. There are men in the appraiser's department upon whom a great deal of responsibility rests, and a very little want of care on their part would result in very heavy loss to the government. I think the government ought to compensate such men very liberally.

By Commissioner AMBLER :

Q. Is it not a fact that the employés at the custom-house are, as a rule, very efficient in their work?—A. In the third division, in which I have had experience, I think that is true.

Q. I want to ask you a question in regard to this proposed means of determining cases between the importers and the government. You suggest a court of five judges. Have you any special reason for suggesting that number?—A. The only reason I have for suggesting it is, so that in case of vacancies by death, you would have enough experienced judges left, and the business of the court would not be interfered with seriously. If it was not for that contingency, I think three competent men would be a sufficient number.

Q. Do you not think a selection could be made of experienced men from the custom-house who could decide these cases as well?—A. It seems to me that gentlemen composing such a court should not only be men of a judicial turn of mind but men of considerable analytical power.

Q. It has occurred to me that if such a tribunal should be created, it should be largely composed of men who had experience in the custom-

house and had acquired an aptness for the determining of this class of questions?—A. I do not know that men in the custom-house would be any better fitted for such positions than men who had been engaged in mercantile pursuits. The court must partly be composed of course of men skilled in the law, but so far as the other members are concerned, I do not know why the experience gained in mercantile pursuits would not be equal to experience gained as an official in the custom-house. The only men in the custom-house fitted to take such a position would be men in the appraiser's department.

By Commissioner OLIVER:

Q. These burdens and annoyances which you and the other gentlemen of the delegation have detailed to us appear, from your account, to be almost unbearable; have you not to a certain extent become accustomed to them?—A. I never have become accustomed to them, but have always kicked at them.

Q. How many importers are there in the city of New York, approximately?—A. I could not say what the number is.

Q. The only point I wish to make concerning these troubles and annoyances which you have detailed is, that, after all, notwithstanding what you say, we have not had all told, after sitting four or five weeks at Long Branch and sending all the word we could to the people, hardly any complaint; and just now, as we are closing our sessions, when every moment is occupied and we feel hurried in our work, this complaint is laid before us when we cannot as thoroughly and carefully consider it as we would like to.

The WITNESS. We are to blame, I suppose, and it looks as though we were very indifferent about these matters. But take any public matter of this kind, or any matter that comes under our local government, and it would seem as though the people would look after their interest more; but they do not.

Q. But this is a matter that you deal with every day of your life; it is part of your business. We have left our business and given ourselves to the subject of investigating this whole question of the tariff, and now within a few weeks of the time of closing our testimony you come before us and present these matters for the first time. What reasons have you for delaying until now?—A. I do not know how it is, except that perhaps we did not have confidence in the results of your work. A gentleman said to me not long ago: "This Tariff Commission don't amount to that (snapping his fingers), and you will waste your time in going up there before them." That is all the encouragement we have had from some of our fellow-citizens and business men; they said we would absolutely waste our time in coming up here. You know the public will bear most anything until it is so bad they cannot stand it any longer.

Commissioner OLIVER. But that is not the point at all. The point is that Congress heard of your troubles and the President appointed a Commission, and they have devoted themselves continuously without stopping one single day for rest, from the time they received their appointment until now, to the hearing of suggestions from the people in regard to these matters, yet you gentlemen have not taken the trouble to investigate and find out whether we were worthy of confidence or capable of investigating these matters or not, and have neglected your own business and the public business, until now you come before us and say that you have not confidence in the Commission.

The WITNESS. I have not said that; I said that was a remark made to me by a business friend.

Commissioner OLIVER. Then it really comes down to this point: that you acknowledge you have to some extent been neglecting your own interest?

The WITNESS. Yes, sir; I think it does come down to that.

Commissioner OLIVER. Don't you think it is always fair and right to judge men by their works?

The WITNESS. I do.

Commissioner OLIVER. Very well, then, that is all I have to say in regard to the matter. I think it would have been the proper thing for you to have judged the Commission by its work.

F. B. VAN VLECK.

NEW YORK, *October 5, 1882.*

The following statement, submitted by Mr. F. B. VAN VLECK, of New York, giving the reasons why the tariff on cotton yarns, imported for weaving purposes only, and limited to two-fold yarns, should be reduced, was ordered to be printed.

Manufactured cotton fabrics come in at only 35 per cent. ad valorem duty. The yarns from which these fabrics are wholly or in large part made, pay both a specific and ad valorem duty, as follows:

Upon cotton yarn in value over 60 cents per pound and not exceeding 80 cents per pound, there is a specific duty of 30 cents per pound, which is 40 per cent. on yarns valued at 75 cents per pound and an ad valorem duty of 20 per cent., making a total of 60 per cent. duty, and averaging 60 per cent. duty on the finer and more valuable yarns, and running to as high as 70 per cent. total duty.

This discrimination in favor of foreign manufacturers against our own has prevented, and is now preventing, the extensive manufacture in this country of a large line of fabrics, embracing velvets, velveteens, plushes, and goods of similar character; galloons, braids, bindings, cords, laces, gimps, fringes, ribbons, vestings, cambries, silesias, lastings, serges, alpacas, &c.

These finer yarns for weaving purposes are not made to any extent in this country, and while no interest will be hurt here, the reduction we now seek will, if effected, greatly extend the range of the manufacturing of these woven fabrics and kindred interests in this country, especially in the production of the finer classes from which this onerous and unfair duty now excludes us, and the relief therefrom is particularly desirable as to the fine numbers of such cotton yarns, ranging from number 60 upwards.

Further, the revenue derived by the government from duty on these yarns is insignificant compared with the magnitude of the interests involved, and the material wealth which would be added to the country by the manufacture of these fabrics being established here.

Manufactures of silk, or of which silk is the component of chief value, come in at 60 per cent. "Silk in the gum, tram, thrown, or organzine," and from which silk fabrics are made, comes in at 35 per cent., as also spun silks for filling, in skeins or cops.

Cotton yarns should have at least the same relative chance, and should be admitted at a rate of duty proportionately less than the fabrics made from cotton yarns.

Some time ago, when the tariff was under consideration, the foregoing "Reasons, &c.," with a petition signed by a large number of merchants and manufacturers, were presented to the House Committee on Ways and Means.

These reasons are respectfully submitted to your honorable Board.

CHARLES MCK. LEOSER.

NEW YORK, *October 6, 1882.*

The following communication from Mr. CHARLES MCK. LEOSER, president of the Wine and Spirit Traders' Society of New York, was ordered to be printed:

I am directed by the council of this society to lay before you the following suggestions regarding the tariff on wines and spirits:

1st. *The duty on spirits.*—The present rate of \$2 a proof gallon should be reduced to \$1.50. This would be a small but grateful concession to our importing interests, and the manufacturers of domestic spirits have agreed to approve of this reduction, while this country is on the footing of the most favored nation in respect to the duties imposed on spirits imported into France. This is now the case. It is considered by this council that the duty on rum and gin might well be reduced to \$1, as the present rate constitutes an ad valorem of from 400 to 500 per cent.

2d. *The duty on wines.*—While this society does not wish to put itself on record as advocating any changes that might be detrimental to American growers, it would be advisable, if it were considered by Congress that it would not militate against the interest of the American producer, to reduce the present specific rate of 40 cents on still wines to 25 cents. It should be borne in mind that the duty on wines and spirits should in no case be made ad valorem, owing to the great difficulty in determining their values and consequent temptation to fraud. It should also be noted that facilitating of the consumption of light wines and similar beverages is probably the only way in which legislation can be really made to conduce to the sobriety of the citizen.

The paragraph in schedule D, section 2504, of the Revised Statutes, which provides that brandy, spirits, and other spirituous beverages under first proof shall not pay a less rate of duty than 50 per centum ad valorem should be repealed. This point has been submitted to the Treasury Department and by them to the New York Custom-House, and it is the unanimous opinion of all who have investigated the matter that the present statute is the result of an error in the compilation of the Revised Statutes. Its repeal would enable us to import old brandies in their natural condition, which is now impossible except at prices which place them beyond the reach of the ordinary capitalist. The practical result of the present system is that old brandies are fortified before shipment to this country, and our tariff regulations debar us as a nation from enjoying the real old brandies of Cognac in their original perfection.

4th. *Consumption certificate.*—There should be a provision, under such regulations as might be prescribed by the Treasury Department, for substituting in the place of the landing certificate a consumption certificate by the officers of such vessels, for goods consumed during the voyage aboard ships clearing for foreign parts. This would open up to American merchants an important traffic, which by the present law is thrown into foreign markets.

5th. *Abolition of consular certificates.*—The consular certificate now required by law to be attached to all invoices should be abolished when the duty is wholly specific, as in the case of wines and spirits. Such

certificates are obviously of no value in assessing duties, and the present custom is vexatious and harassing in the extreme to the merchant, while needlessly absorbing the valuable time of the consul, which might frequently be much more usefully employed in procuring and recording valuable commercial information. In addition to this it is frequently made use of by grasping officials to extort valuable considerations from shippers, and has the effect of embarrassing trade and enhancing the prices to the American consumer, and continuing the disrepute in which the civil service of the country is now held among foreign nations.

6th. *The stamp on imported wines.*—The stamp now required to be fixed to the cask containing imported wines and spirits should be abolished. It has been found not only to be of no practical use, but really an aid to the fraudulent dealer, while to the honest merchant it is frequently the source of irritating and costly delays in handling the merchandize.

7th. *Substitution of the buyers' bond for the sellers'.*—There should be a provision for the substitution, under such restrictions as might be determined upon by the Treasury Department, of the buyers' bond for the sellers' when wines and spirits are sold in bond down to a minimum limit of the amount of duty covered by the bond of, say \$500. This would cause little or no additional work in custom-houses, and be of great benefit to the importer.

8th. *Extension of the bonding period.*—The additional ten per cent. now levied on merchandise remaining in bond more than one year should be abolished for wines and spirits, and a provision of law adopted permitting them to remain in bond without payment of duty for a period of five years from the date of landing, and when they are withdrawn for consumption the duty should be paid on amount withdrawn, subject to limitations of leakage, as provided by the present law in the case of domestic spirits. This would enable our importers to purchase young wines and spirits in the countries of production and ripen them here, so that the consumer could be furnished with a better article for his money, and we should, in the course of time, be able to accumulate here such stock of fine old brandy, etc., as those for which the London docks are now famous.

LOUIS WINDMÜLLER.

NEW YORK, *October 6, 1882.*

The following communication from Mr. LOUIS WINDMÜLLER, of New York, in regard to the duties upon sheet zinc and spelter, was ordered to be printed:

I beg to submit to the consideration of your honorable Commission that the present duty upon sheet zinc of $2\frac{1}{4}$ cents per pound is equal to 53 per cent. of the present foreign value. It costs now, at the principal places of production, in Belgium and in Siberia, $4\frac{1}{2}$ cents of our currency per English pound.

Since the article is used extensively in every house in this country, for protection of floors against fire, under stoves; for covering of bathtubs, counters, &c.; for washboards; to cover floors on steamboats, I think this duty is too high, inasmuch as it enhances the price of an article of necessity more than is expedient.

It requires no skilled labor to roll zinc. The only mill in this country which, until quite recently, had the monopoly of rolling it in the United States is at La Salle, in Illinois; the product is 15,000 tons annually. The owners have amassed a fortune in a comparative short space of time, at the expense of the consumers.

The metal from which zinc is rolled (spelter) is taxed $1\frac{1}{2}$ cents per pound. Its present value in Silesia is \$3.80 per 100 pounds. The duty is therefore nearly 40 per cent. of the present foreign value. The annual product of American spelter in the United States is about 30,000 tons. The quality of American spelter is generally superior to the foreign article. Some is exported at prices showing that it is highly appreciated abroad.

I give you on the other side a list of the imports of spelter and zinc for the last ten years; they have increased lately in spite of the high duties, because the American product was not sufficient for the increased demand.

I consider the duties upon this as well as upon all other metals entirely too high. I see no good reason why the whole people are taxed for the benefit of the few producers of these necessary raw materials.

Most metals are found in this country in a state of greater purity than in other countries. For this reason, and by superior mining machinery, metals could be produced in the United States as cheap as in any country of the world.

I advocate a reduction of the duty upon sheet zinc to $1\frac{1}{2}$ cents per pound, spelter to 1 cent per pound, and upon all other metals in the same proportion. This reduction may temporarily reduce the revenue derived from these articles. It would not, however, curtail the quantity produced here, but only the profits made by the producers. The cheapening of the price would gradually increase the consumption.

They would be used extensively and for a great many purposes for which the present values are too dear in this country, but for which they have been used for a long time in England and in other countries.

Importations at the New York custom-house of sheet zinc and spelter.

IRA BURSLEY ET AL.

NEW YORK, *October 6, 1882.*

Mr. IRA BURSLEY, commission merchant, New York City, addressed the Commission as follows:

I do not represent any manufacturer, but I represent fifty millions of people who buy and use sugar. I have heard one manufacturer here to day [Mr. William Marshall] say that he is willing that the duties on the goods he makes shall be reduced, and I heartily agree with him in the views he expressed, that hemp may be allowed to come in free of duty.

I am an importer of sugar. The sugars imported into the United States last year paid, I think, \$40,000,000 in the way of duties. The present duty on sugar was imposed in 1861, under what is known as the Morrill tariff, and was subsequently raised 25 per cent., and stands at that increased figure now; the duty has never been decreased. The rate of duty paid on sugar, according to the f. o. b. cost, ranges all the way from 25 to 75 per cent. ad valorem. You have had all sorts of suggestions, I suppose, as to how these duties should be imposed. All we want to urge is, that there shall be a reduction, and leave it to the government to decide whether the duty shall be a specific or an ad valorem one. I am in favor of ad valorem duties, but certainly the duties ought to be reduced in some way. When the government gets \$40,000,000 in the way of duties out of one article it ought to be willing to see some reduction made in the rate. If the duty on sugar was put on the basis of about 25 per centum ad valorem, I suppose it would bring a revenue to the government of about \$20,000,000 instead of \$40,000,000 a year. It seems rather strange legislation that sugar should be made to pay \$40,000,000 of revenue, and tea and coffee come into the country free of any duty. A moderate duty on tea and coffee would, I think, be a fair thing, and if the duty on sugar was taken off so much as to reduce the revenue to the country, that loss could easily be made up by putting a duty of five cents a pound, say, on coffee, and five or ten cents a pound on tea—I mean a specific duty, which can be easily collected, with no chance for defrauding the government.

I am aware that one of the arguments always advanced in favor of keeping the duty on sugar is, that Louisiana has got to be looked after. Louisiana has made, say, 60,000 tons of sugar this year. Suppose they make one cent a pound profit on that, which is a fair net profit on 60,000 tons, that would be \$1,200,000. In order that Louisiana can make from \$750,000 to \$1,000,000 a year the consumer of sugars in this country is taxed \$40,000,000. I think it would be better to put Louisiana in the river and harbor bill and let them get their money out of that. I object, as an importer and as a consumer, to this tax. I think the government ought to take in view the matter of reducing it.

By Commissioner UNDERWOOD:

Question. Is there any coffee produced in the United States?—Answer. No, sir; not that I know of.

Q. Or any tea?—A. No, sir; no marketable tea. The Agricultural Bureau in Washington have attempted the cultivation of tea, but it has

not been a marketable article. The importation of coffee is about 550,000,000 pounds a year.

Q. Do you know the cost of the labor that produces the sugar of Louisiana?—A. No, sir.

Q. Do you know the cost of labor that produces sugar in the West Indies?—A. It is pretty difficult to tell what it costs for labor in a slave country; I do not know. I can tell you the cost of labor in Java.

Q. If the cost of labor in Louisiana is three times as much as in the West Indies, would it not destroy the raising of sugar in Louisiana to take the duty off it?—A. It probably would, but I propose to take up a contribution. It would destroy the industry; with free sugar, Louisiana would not raise a pound.

Q. Are you aware that a large section of country in Florida, near Lake Okechobee, is about to be opened up for the cultivation of sugar?—A. Yes, sir; I have received some consignments from there.

By Commissioner BOTELER :

Q. In view of any possible national complication with foreign countries, thus preventing the importation of sugar, would it be altogether wise in us to destroy our domestic production?—A. I think we should get sugar from somewhere, in case we paid the price for it. We might have to pay what is called a war price, but we are usually in a state of peace with foreign countries, and have been for many years, and I think that ought to be considered rather than the possibility of a war.

By Commissioner McMAHON :

Q. Is the polariscope test alone a fair test of the value of sugar?—A. No, sir; not alone.

By Commissioner AMBLER :

Q. What additional test do you regard as necessary to determine the true value of sugar?—A. I say the polariscope is not alone a fair test of the value of sugar, but the polariscope is a fairer test of the value of sugar than the eye alone. For instance, a sugar that is dark in color, say No. 7, Dutch standard, is a poor looking sugar to the eye, but that sugar may test 95 or 96 per cent. of pure sugar; while a light weight sugar, that will in some cases not test over 75 or 80 per cent., is much better looking sugar to the eye. It is very difficult to say how we should arrive at the true valuation of sugars. If you hear the refiners and importers of sugar talking together about the matter, you will get as much befogged about it as the Ways and Means Committee in Washington did; they did not know what to do.

There is another point I desire to speak upon in connection with the tariff. New York imported last year 575,000 tons of cane sugar. The tariff has worked this thing so into the refiners' hands that in this market, one of the largest in the world to-day, we have only nine buyers of sugar. The tariff is formed in such a way that not a single pound of sugar can be imported to go into use as sugar, but it has got to go through one of the 15 or 16 refineries in the United States. It is a very good thing for the refiners. It suits me well enough, because I import a low grade of sugars; but is it a good thing for the people who consume the sugars?

Q. That is occasioned, is it not, by the use of the Dutch standard of color as a test, and as a result it has been found more profitable to import a low grade of sugar?—A. Yes, sir; the United States tariff encourages the importation of a poor article. The process of making

sugar in Cuba has been entirely changed to suit the demands of our tariff. I suppose that is all fair enough in a business point of view.

By Commissioner GARLAND :

Q. What average duty do you recommend should be placed upon sugars ?—A. I should recommend free sugar, if you want my own ideas; but if that is not practicable, I would recommend as great a reduction as the government would see fit to make.

Q. You suggested a duty of five cents a pound on coffee ?—A. I did not suggest any duty except in case of the diminution of the revenue by a reduction of the taxes on sugar. If the revenue from sugar is reduced largely, of course we must tax something else to take the place of it, and I think that tea and coffee are fair articles for taxation.

Q. Do you think five cents a pound on coffee would be a fair rate ?—A. Yes, sir.

Q. What ad valorem duty would that be equal to ?—A. To-day the market value of East India coffees is 8 cents a pound and Rio coffees 9 to 10 cents a pound. On Rio coffee it would be 35 per cent., and on Java coffee it would be 25 to 30 per cent. on the f. o. b. cost.

By Commissioner BOTELER :

Q. You recommend that sugar shall be admitted free of duty, with the assurance and knowledge that if we admit it free it will strike down entirely the sugar interests of Louisiana, and also the sugar interests of the northwestern part of our country, where they are making sugar from sorghum ; in other words, the whole sugar interest of the United States ?—A. Yes, sir ; I do ; and I would strike out glucose, too.

Mr. OSGOOD WELSH, of the firm of T. & W. Welsh, of New York, commission merchants, said :

I wish to indorse what Mr. Bursley has said to you in regard to the matter of the duties on sugar. You have had a statement presented to you this morning by a gentleman who said that he represented ten thousand people who were engaged in the manufacture of corsets. That gentleman appeared for himself and in the interest of the people engaged in that industry. I appear here in behalf of fifty million of people who use sugar, the same as he did for those ten thousand people whom he represented. The duty on sugar is about 50 per cent. of its value. All the foreign sugar that is consumed in this country is refined before it enters into consumption. The law practically prohibits the importation of sugars fit to go into consumption. The result is that when a consumer buys a dollar's worth of sugar, 30 cents on every dollar expended is paid as a tax, or represents the amount of the tax. As Mr. Bursley has said, the importers and refiners, after consultation among themselves, have never been able to agree on the true way of assessing the duty on sugar. It seems impossible to do it in such a way that every one will be satisfied. England could not do it, and so she gave up imposing any duty whatever upon sugar ; at least that was the main reason, the difficulty they had in collecting the revenue on sugar. If a revenue is required, as it necessarily is, to carry on the government, it can be raised partly from tea and coffee. There is no difficulty in collecting specific duties on those articles. The trouble about sugar is that there are such great varieties of sugar of such different value, that any rule applied to one cannot be properly applied to the other ; at least it does not follow that it could be.

The question was asked just now as to the use of the polariscope,

whether it in itself gave an idea of the value of sugar. It does not. It conveys no idea whatever to the merchant, that is, simply to say that sugar tests so much by the polariscope; though by using his sense of touch and sight in conjunction with the polariscope he can arrive at an approximate idea of the value of sugar. But in itself alone it is of no value whatever. I was talking with a refiner yesterday on this very subject, and he told me that if he had to depend upon the polariscope alone, or on the sight and touch alone, he would prefer the sight and touch to determine the value of the sugar; that is, if he was to buy it and take it to his house to refine.

If the duty on sugar cannot be abolished, then I should like to see it made as low as possible. I have no especial interest to subserve in this matter. Our house has been engaged for fifty years in the importation of sugar, as commission merchants, and they have managed to conduct their business under the various tariffs which have existed during all that time.

There is one other point I would like to touch upon, and that is this. The tariff as it exists to-day prevents the importation of any sugars above No. 13 Dutch standard in color. The object of that provision was to force the importation of natural sugars, that had to be refined before they could enter into consumption, and it has worked very well indeed. In Europe the crop of beet sugar is, I think, about a million and three-quarters tons. None of that sugar can be brought to this country. It all has to be refined before it enters into consumption, and we cannot bring in any of it here because it is too light in color. It has been said to me that I favored a specific rate because it would favor the Cuba sugars. That is not so at all. I would have the tariff so arranged that we can get our sugars from the cheapest places in the world, whether they are beet sugars from Europe or sugars from Cuba, South America, or the West Indies. As I have said, of the million and three-quarters tons of beet sugar annually produced in Europe, we can get hardly any of it, because it is too light colored and we would have to pay too high a duty as the tariff exists to-day.

By Commissioner McMAHON:

Q. I will ask you one question. Are not the quotations of the prices of sugar generally throughout the world based upon the polariscopic test?—A. In conjunction with other things.

Q. I am talking of the published quotations you receive from time to time.—A. In conjunction with other things.

Q. They name other attributes as well as a polariscopic test?—A. Yes, sir.

Q. What are they?—A. The country where the sugar is grown, and the kind of sugar, with the commercial designation of the sugar, which is a designation of the method in which the sugar is made—whether clayed, molasses, or centrifugal sugar. Centrifugal sugars are boiled in a vacuum pan and then purged in centrifugals.

Q. Then, there is a sub-description which identifies the article?—A. Yes, sir. You get for molasses sugar testing 90, 7 cents; for muscovado sugar testing 90, 7½ cents a pound. The polariscopic test alone conveys no idea at all to the mind of the buyer.

WILLIAM MARSHALL.

NEW YORK, *October 6, 1882.*

MR. WILLIAM MARSHALL, of the firm of L. Waterbury & Co., New York, representing the manufacturers of bagging, addressed the Commission as follows:

Manila and Sisal hemp should be admitted free of duty, and a duty of not less than $1\frac{1}{4}$ cents per pound, or about 10 per cent., put upon the manufactured goods, which will cover the indirect duties on the material and machinery incidental to the manufacture of cordage, and place us upon a footing of equality with the manufacturers of other countries, enabling us to sell our cordage in those countries which manufacture little or none. Manila and Sisal hemp cannot be grown in the United States; consequently their admission free of duty will conflict with no established industry here. The article manufactured from these fibers, viz, cordage, cannot compete successfully in foreign countries, with that made in England, for instance, because of the duty we have to pay on the raw material. It is a fact that rope made in the city of Brooklyn can be sold for less money in China to a foreign buyer than to an American ship-owner in the city of New York, for the reason that there is a drawback of \$22.50 per ton for rope exported, of which the foreigner gets the benefit, while our home trade must pay the whole duty.

The number of vessels engaged in carrying Manila hemp from the Philippine Islands to this country, which in 1881 was 51 sail, would, if this article were admitted free of duty, be largely augmented on account of the increased consumption of hemp for the export trade.

Jute butts should be admitted free of duty, for the reason that there is no fiber produced in this country which can come in competition with them, and by a simple line of reasoning it will be seen that the burden falls indirectly on the people at large. There are but two principal products manufactured from jute butts, viz, bagging for baling cotton, and paper. The manufacturer of the bagging charges the planter enough to cover the duty he has paid on his raw material; the planter charges the mill-owner in the same proportion; the merchant, who buys the cotton fabric, pays the same duty; and so on to the consumer, who, in reality, pays the duty on every pound of jute butts that comes into the country.

Present tariff designation or commercial name of article.	Present rate of duty.	Proposed rate of duty.	Estimated total amount of reduction of duty—average of five years.
Manila hemp	\$25 00	Free ..	\$650, 000
Sisal hemp	15 00	Free ..	160, 000
Jute butts	6 00	Free ..	250, 000
Bagging	03	\$0 01 $\frac{1}{2}$
Manila rope	02 $\frac{1}{2}$	1 $\frac{1}{4}$
Sisal rope	02 $\frac{1}{2}$	1 $\frac{1}{4}$

There are many things directly and indirectly connected with our line of business on which we have to pay duties besides the raw material,

and I think it should be taken into consideration that in this country we need more commerce. I believe if you can cheapen the price of cordage you will do something towards enabling the commerce of the country to compete with foreign commerce. No doubt many of you remember very well when our commerce stood at the head of the world; there was only one English line that had more tonnage than we had. Now that has all gone, and there is but one reason for it, and that reason is too much protection; too much duties. I think that other manufacturers ought to be able to protect themselves as we have protected ourselves. To-day, if it were possible to abolish all custom-houses, I would take my chances in the world's trade with England or any other nation. I would be willing to meet the world in a fair battle for the trade of the world. Inasmuch as I know that it is impracticable to do away with custom-houses, as we must have some revenue to support the government, for one I would be in favor of keeping high duties on all luxuries, and reducing duties on all the necessaries of life. That would be the method which I would suggest.

W. J. PARSONS.

NEW YORK, *October 6, 1882.*

Mr. W. J. PARSONS, of Brooklyn, N. Y., representing the Columbia Chemical Works, addressed the Commission as follows:

I desire to call the attention of the Commission to the article of carbonate of magnesia. The manufacture of this article in the United States is only about two years old, and is, therefore, in its infancy. Until recently it was wholly imported from Europe, mostly in small blocks (not powdered), and sold only by druggists for pharmaceutical purposes. Within a few years it has come into considerable use in a powdered state as an absorbing and neutralizing base for nitro-glycerine in the manufacture of high explosive compounds. One concern in Philadelphia, two in Brooklyn, N. Y. (three in all), now make the article in a powdered state for the manufacture of explosive compounds. These three concerns employ about 40 laborers, making with their families about 200 persons, depending for their living on the manufacture.

The American article is fully equal to the best foreign, and has already replaced entirely the foreign make in the manufacture of explosive compounds, at prices far below those formerly paid by the powder companies for the imported article. It seems most desirable that this important industrial use of making explosives should be independent as far as possible of foreign manufacturers. Heretofore it is thought cake magnesia for the drug trade has not been made in the United States, but it soon will be, and the home market secured for it just as it has for the powdered carbonate for explosives.

But for the 6 cents per pound duty the American manufacture could not have been started, and if the duty was lowered at all for some time to come, the foreign makers could easily afford to drive the American manufacturers out of the business, and then would be able to make the explosive makers pay their old-fashioned prices, far higher prices than they now pay.

Nearly or quite one-half the cost of the article is labor; and in the case of cake magnesia it would be about three-quarters. All the raw materials of this article are imported and dutiable. One, kiesirite, is a by-product of the Stassfurt potash mines in Germany; it cannot be produced in this country, and, though largely used as a fertilizing material, pays a duty of 20 per cent. The other article, the highest grade of soda-ash, pays an average of about 24 per cent. of duty.

The imported carbonate of magnesia of the highest reputation sells here for about 31 cents per pound. The average selling price of all grades of magnesia is not less than 20 cents per pound, and the duty of 6 cents per pound is only 30 per cent. on the average selling price, which is a lighter duty than most articles in the list of chemicals pay. In less than three years the home manufacturers have produced a better article than the foreign, and have supplied the high explosive trade at much below the old prices.

We append analyses of the test foreign make (Jennings'), and of our own; it shows the decided superiority of the American make. We have no analysis of our two competitors, but have no reason to doubt that they are equally superior to the foreign.

Comparative analyses of carbonate of magnesia, made by Jennings, of Cork, and the Columbia Chemical Works, 66 Water street, Brooklyn, made by W. M. Habirshaw, F. C. S.

Constituents.	Jennings.	Columbia Chemical Works.
Carbonate of magnesia.....	74.63	77.19
Oxide of magnesia.....	1.82	.60
Carbonate of lime.....	1.27	.07
Carbonate of soda.....	.54	.73
Iron and aluminum oxides.....	.22	.03
Water of combination.....	21.52	21.38
	100.00	100.00
Total magnesia (MgO).....	40.81	41.03
Total carbonic acid (CO ₂).....	36.32	37.09
Weight of cubic foot in pounds.....	10.73	9.81

In view of these facts, it is respectfully submitted that unless the principle of protecting, directly or indirectly, home manufactures is abandoned, the specific duty of 6 cents per pound on carbonate of magnesia is not too great, and it should not be either lowered or removed.

Dr. S. A. GOLDSCHMIDT, of Brooklyn, who was present, said that he indorsed all that Mr. Parsons had stated to the Commission in regard to the matter.

JOHN D. CUTTER.

NEW YORK, *October 6, 1882.*

Mr. JOHN D. CUTTER, of New York, manufacturer and importer of silk goods, addressed the Commission as follows:

GENTLEMEN: I would respectfully advocate a specific duty upon silk goods for the reason that under such duty all will be served alike, disputes and reappraisements will be avoided, and the great uncertainty which now attends the importation of silk goods will be dispelled. It will also tend to render the value of silk goods more stable in this market, ameliorating fluctuations in value, loading the foreign value by a constant quantity.

The objection which is urged against a specific duty in general, viz, that it tends to bear most heavily upon the cheaper sorts, and thus discriminates against the poor man, does not apply to a specific tariff on silk goods, because silk in any form is an article of luxury, and cheap silks are, as a rule, meretricious and deserve a prohibitory duty in the interest of the public.

I further advocate a specific duty by the pound and square yard jointly. The square-yard duty is the natural complement or equipoise of the pound duty, being increased as the surface, and consequently as the labor is increased, and our duty should be levied on the labor rather than on the value or weight of the raw material. The mere mention of a square-yard duty will bring a protest from all custom-house officials and importers, for they only know it as causing intolerable and interminable calculations. But this is needless; a square-yard duty can be made as simple as a pound duty, and then all objections will disappear and it may serve its beneficent purpose.

I advocate a square-yard duty of 36 cents per square yard, or some multiple of 36, or some decimal or aliquot part of 36. I will not enlarge upon this; any one of the least experience in these matters will see at once that the amount of duty per running yard is given at once by laying the yard stick upon the goods.

I further advocate that all limits of value or of weight per square yard prescribed by the tariff be fixed upon the same principle. In fixing these weights you need not be confined to the pound avoirdupois, but may use the ounce or gram. To determine whether any article was within the limit of weight provided by the tariff, it would only have to be placed in a scale, the weight divided by the length, and the result compared with the weight of the goods.

I advocate also the following:

Raw silk, cocoons, waste silk, silk-worm eggs, free.

Combed waste or sliver, 50 cents per pound.

Choppe or spun silk yarn, undyed, \$1 per pound.

Choppe or spun silk yarn, dyed, \$1.50 per pound.

Choppe or spun silk yarn, dyed and wound, \$2 per pound.

Thrown silk, tram, organzine, or sewings, in the gum, \$1.50 per pound.

Thrown silk, dyed in hank, \$2.50 per pound.

Thrown silk, dyed and wound, \$3 per pound.

Silk fabrics in the piece: Tusset pongee or wild India silk; Shantung-pongee or wild China silk, imported from Asia (see samples), \$1.50 per pound.

China white pongee, imported from Asia (see sample), \$3 per pound.

Silk fabrics, all silk or containing more than 75 per cent. by weight of silk, \$4 per pound; 18 cents per square yard.

Fabrics containing more than 25 per cent. by weight of silk, and not more than 75 per cent., \$2 per pound; 18 cents per square yard.

Fabrics containing more than 5 per cent. by weight of silk, and not more than 25 per cent., \$1 per pound; 18 cents per square yard.

It has been suggested that in levying a duty on foreign silks some distinction should be made between the black and colored. It seems to me that opinion is entirely erroneous. The black silk that comes to this country now is very heavily weighted. I have been making a pure silk in this country, and I find in competition with that a pure silk is being sent us from Lyons. If we should levy a duty of \$4 on black silk and \$6 on colored silk, the one would be as pure as the other in the course of a few months. I have here a silk which contains less than 10 per cent. of dye-stuff. It is brought here in competition with my production. Foreign silks are coming to this country in competition with these silks, and I think it would be a mistake if you make a specific duty on colored silk different from the duty on black silk, because the black and colored will both be pure when you put a specific duty on them.

By the PRESIDENT:

Question. You are a manufacturer of silk?—Answer. Yes, sir; and an importer. I import a great many China pongees.

Q. How do the rates of duty which you recommend compare, when reduced, to the existing ad valorem rates?—A. I think they would be a little less. I think the value of a pound of silk on the other side of the water is somewhere in the neighborhood of \$8. The raw material is worth about \$6, and the rest is the cost of manufacture. The present rate on that would be about \$5.50. I have suggested \$5.

Something has been said about undervaluations. I have been during the past two or three years called upon to go to the custom-house to give testimony or to act as merchant appraiser, and I believe there could not be a more conscientious and faithful set of men employed than are now employed in our appraiser's department. It is a wonder to me how they can get through with so much business satisfactorily. I know there is no dereliction of duty on their part, but yet silks often go through the custom house at a less rate than they ought to. For instance, I was called as a merchant appraiser in a case where the goods, after being advanced, were paying a duty of 44 francs per kilogram, while the raw material was worth 60 francs. I asked the appraiser if he was aware that the goods when advanced only figured up 44 francs, and he said "Yes," but it was all that he could get. I was a merchant appraiser in a case where, after investigating the matter for three months, I gave it up. I was perfectly sure of my position, but I had my business to attend to; I had not any more time to spend on the subject.

I have been brought up in this business since I was a boy 15 years of age; and from my experience I do not think it is possible to collect the full duty of 60 per cent. on these goods. The importer of New York to-day spends half his time at the appraisers' department. He knows what is going on, and can take advantage of it. This is no discredit to the appraisers, for I admit I could not do as well as they do myself. How can they discriminate between two standards? They have to rely on something to help them. You will find, practically, that a man who has to appraise these goods will at times get to relying on the count of threads, because there must be some sort of a comparison in order to get at a

correct judgment of an article. At other times you will find that he is testing them by weight, and at other times by other methods. And the merchant who is at his elbow and can see what these different criterions are can take advantage of them; and if the criterion is weight he will try and profit by it. In that way the present tariff works unfairly, not by the dishonesty or unfaithfulness of the officials, but because it is impossible to ascertain the value of silk goods by the case. Give us a specific duty, because when we once know exactly what we have to pay we shall be able to adapt ourselves to it, and shall be relieved of a vast amount of anxiety and uncertainty.

By Commissioner AMBLER:

Q. Do you say that manufactured silk, not loaded, will average about \$8 a pound in different countries?—A. In a foreign country, in Italy, for instance, a raw silk costing about \$6 could be spun into a thread, and then woven into the cloth for \$2 or \$2.50 per pound more.

Q. And that, at the present rate of 60 per centum, would be about \$4.80?—A. Yes, sir; but with us it costs about \$3; as much as that. It would cost me here about \$6 or \$7 a pound to spin and weave a pound of silk.

Q. So that the rates you suggest would be a slight decrease on the present rate of 60 per cent.?—A. A slight one.

Q. That is, the difference between \$4 and \$4.80. I understand you to say that there would be some inequality in the fact that it would bear heavier on the cheaper quality of silks?—A. Yes, sir.

Q. What would be the possible extent of that, in round numbers?—A. I suppose silks are imported at the custom-house to-day at, say, 44 francs a kilogram. Those goods would be passed through the custom-house at \$4 a pound. If you take the gum out of it, it is worth \$8.

By the PRESIDENT:

Q. Do you think the adoption of specific duties would lead to the abandoning of the practice of loading silks?—A. Undoubtedly, and if that were done it would be worth millions to our people who are buying silks.

Q. Is there any other adulteration except the loading?—A. No, sir; I think that is all.

Q. How long has this system of loading been practiced?—A. Since the grosgrain silk came into fashion, about the time of the breaking out of the war. We formerly had glacé silk, made of plain threads each way. When they wanted this ribbed silk with the lusterless appearance, they could not keep these little threads in place unless they weighted them and made a kind of cloth. If it was pure silk, they would slide out of place, and you could put your finger through the silk. Weighting seemed to be an essential quality for the gros grain silks, which for 10 or 20 years past have been the most fashionable silks. It is not essential, but they will not go to the expense of making them properly. They put the material on scantily, and make it stay there by putting on weighting matter.

By Commissioner MCMAHON:

Q. You make four divisions, and the first one includes silks at \$3 a pound. Is that a pure silk?—A. Yes, sir.

Q. Is there any adulteration in that quality of silk?—A. No, sir; none whatever.

Q. What distinction do you make between silk fabrics and those; do you exclude those from the ordinary silk fabrics?—A. Yes, sir.

Q. Then you go on, "or containing more than 75 per cent. by weight of silk, \$4." There is a difference of a dollar on 25 per centum—difference in weight as a basis?—A. Yes, sir.

Q. Then you next take "up fabrics containing more than 25 per centum weight of silk, and not more than 75 per centum," a difference of 50 per centum by weight, and make a difference of \$2 a pound. Is not that too big a jump; don't you allow too much margin between the two?—A. I meant to make the classification in this way: First, perfectly pure silk; and in order to avoid the possibility of anybody putting in a little cord on the edge as they do in ribbons, I give a margin of 25 per centum.

Q. Suppose a fabric contains 30 per centum of silk, and 70 per centum of cotton. Do you make that pay the same rate of duty as silk which contains 74 per centum; is not that too large a step compared with the other steps you take?—A. I mean to divide it in the middle; half silk and half cotton.

Q. Should there not be five classes then, in order to approximate anything like the value?—A. Yes, sir; except for simplicity.

Q. In every other case you take 25 per centum at a step; and here in this case you take in 50?—A. You are correct. I wrote this off at my office, and I think you are entirely correct in your suggestion. I would like to say one thing further: I have talked with Mr. Kent frequently about the matter, and he advocates the ad valorem duty. A man who is a perfect expert in valuing goods can estimate them accurately; but it seems to me that the weight is the most absolute test. I take one-quarter of a square inch from a fabric, a seersucker for instance, and put it in the scales, and without the least difficulty tell to within 1 per cent. the quantity of silk and cotton contained in it in a very few moments.

Q. Is the weight alone an actual and accurate test?—A. I think it would be with regard to European silks. These cheap Asiatic fabrics are made from the thread, without other preparation. All the silks made in Europe are made from trams and organzines.

Q. The weight alone you think is an absolute test of the value of fabrics of which silk forms a compound?—A. Yes, sir.

Q. Then why do you add the rate per square yard?—A. Because the labor in weaving it is increased by the square yard; I would not say that the weight alone was a criterion for the finished fabric at all. I believe if you will bring in that square-yard element, you will be able to make one classification which will cover even lace at a pound value.

Q. Do you include ribbons also, a square-yard rate on ribbons?—A. Yes, sir.

By the PRESIDENT:

Q. Would this rate of duty apply to the spun as well as the other goods?—A. Yes, sir; it seems to me that a square-yard and pound duty together could be laid upon all at once.

J. D. T. HERSEY.

NEW YORK, *October 6, 1882.*

Mr. J. D. T. HERSEY, of the firm of Hodges, Hersey & Co., manufacturers of straw goods, New York City, representing the American Straw Goods Association, addressed the Commission as follows:

I desire to read a letter which I presented to the Ways and Means Committee five years ago. The matter has not changed since then:

NEW YORK, *December 28, 1877.*

Hon. F. WOOD,

Chairman Committee Ways and Means, Washington, D. C.:

DEAR SIR: The undersigned having been appointed a committee of the manufacturers of straw goods in the United States to ask your honorable committee to consider the interests of that branch of industry in connection with the tariff question, beg leave to call your attention to it.

The principal materials used in the manufacture of hats and bonnets are braids made of straw, chip, manila, hair, and cotton, and come mostly from Italy, Switzerland, and China, and all pay a duty of 30 per cent.

This duty is felt to be a great burden upon our business, as it is believed that our production could and would be much more largely exported and less of foreign manufactured goods imported if these braids could come in free of duty, as they do into England and other countries, which gives their manufacturers a great advantage over ours. There are about twenty-five thousand persons employed in the United States in this business, but not more than from six to nine months in a year, whereas if we could compete with other countries in prices, and thereby obtain a larger market at home and abroad, these persons could be employed a much larger portion of time and many more engaged in the business.

We therefore most respectfully beg your committee to provide for the free admission of these braids under your revised tariff bill. Fearing to trespass too much upon your time, we present this subject very briefly, but should you desire further information, any inquiries will have prompt attention.

Very respectfully,

J. D. T. HERSEY, *Chairman.*
E. F. KNOWLTON.
OLIVER CARPENTER.
H. S. W. VANDERHOOF.
GEORGE N. SMALLEY.
H. K. WHITE.

The signers of this document are all members of firms engaged in this business. There is a large amount of capital employed in the business, and, as you will see, it gives employment to twenty-five or thirty thousand people. We are excluded almost entirely from trading with Canada, from Central America, from the West India Islands, from South America and Mexico, because of this 30 per cent. duty which we have to pay on materials—on these braids which we use in the manufacture of the goods. We can say without any egotism that no nation in the world can excel us in the manufacture of finished goods and in styles; we take the lead. People come here from Canada and the West India Islands and look at our goods, and when they see them they prefer the styles to any they find in Europe, but they say the prices are too high. The Canadians come here every season, but we cannot sell them any goods except the carried-over goods, which we are obliged to sell at less than they cost us, unless sometimes we have something they are obliged to take which is in great demand and

which they cannot get supplied with from Europe. What we want is to have all braids used in this business brought in free of duty.

I would also say that the Committee on Ways and Means of the House of Representatives has considered this subject very carefully. We have also had members of Congress from our various districts examine the matter thoroughly, and the result was that they embodied in the tariff a provision reducing the duty to 10 per cent.

By the PRESIDENT:

Question. When was that?—Answer. In the winter of 1877-'78. That bill, however, never became a law; it was never passed. We would also like to have Manila hats and South American hats, such as Panama, Maracaibo, and Curaçoa hats, as well as Leghorn hats, brought in free of duty when they come in in the rough, but when manipulated and finished, we would have them under a duty of 25 or 30 per cent. We could do a great deal of business with the West India Islands and Central America, Canada, and other countries, and I have no doubt we could export to Europe many of our manufactured goods if we could be put on a par with Europe in the matter of duties. They have no duty on these materials in England, France, or Germany. There is a duty of 40 per cent. on manufactured straw goods, hats, &c., and, as I have said, the Committee on Ways and Means recommended a reduction of that duty to 30 per cent. That we do not object to; 25 or 30 per cent. is ample protection for the manufacturers if we can have our materials at the same price that they have them in England and France. We have the best machinery in the world for manufacturing these goods, and we think our labor is more intelligent than that employed in Europe. We think we can produce more goods with the same number of hands—we know we can—than they do in Europe. We beg you to give this matter careful consideration, and if you can recommend the introduction of these materials free of duty, we should be very happy to have you do so.

By Commissioner UNDERWOOD:

Q. It is the straw braids that you wish introduced free of duty?—A. Yes, sir; straw braids and cotton braids also.

Q. Are there any manufactories of those articles in this country; are they made at all here?—A. No, sir; not at present. Some years ago, when split straw was used, we braided a good deal in Massachusetts, where the most of the manufactories of straw goods are located. But of late years that is all out of fashion. These braids are made from straw which grows in Switzerland, Italy, and China, and are all very peculiar and very different from anything we can raise in this country. I do not know exactly why it is that we cannot raise it here, but it is probably owing to the climate.

By the PRESIDENT:

Q. Does the duty on braids and the other articles which you desire to have brought in free of duty benefit or protect any industry in this country?—A. I think not.

Q. You say there are no manufactories of braids in this country now?—A. No, sir; none at all of this kind which we use for the manufacture of hats.

Q. Would the admission of these Manila and Maracaibo hats interfere with any industry in this country?—A. No, sir; none whatever. It is entirely different from any goods which are made in this country.

JOHN R. WATERS.

NEW YORK, *October 6, 1882.*

Mr. JOHN R. WATERS, of New York City, representing the importers of dry goods, addressed the Commission as follows :

I appear here as the representative of several importing houses, who have authorized me to present to you their wishes in the form of the following petition :

The undersigned respectfully represent that they are commission merchants, doing business in this city, as manufacturers' selling agents.

The manufactures we handle are domestic and foreign dry goods, and it is out of our experience in the foreign departments of our businesses (which collectively pay \$20,000,000 annually in duties) that we ask permission to suggest the following recommendations to your honorable Commission :

I. That the duties on dry goods be made wholly and absolutely specific, so that the value of merchandise shall not be a factor either in the assessment or the computation of duties.

NOTE.—By means of subclassifications scaled so as to follow the various grades of each manufactured article, a sufficient discrimination as to comparative cost or value can be preserved.

II. That consular invoices be abolished.

III. That such Treasury methods be established as will allow the payment of duties by means of certified checks, and of fees by means of adhesive or other stamps.

IV. That it be allowed to transact before a notary public, or else by attorney, those formalities of an entry which now require the personal attendance at the custom-house of the consignee.

Many years' intercourse with the custom-house, and an intimate knowledge of the workings of the tariff, warrant us in assuring your honorable Commission that each of the above changes represents a much-needed reform (especially the change to specific duties); that they can all be easily effected, and that if carefully made they will place the business of assessing and collecting duties on imports on a footing satisfactory at once to the government and to the merchants.

Yours, very respectfully,

C. A. AUFFMORDT & Co.

DREYFUS, KOHN & Co.

FLEITMANN & Co.

ISELIN, NEESER & Co.

LEWIS BROTHERS & Co.

LUCKEMEYER & SCHEFER.

MEGROZ, PORTIER, GROSE & Co.

E. OELBERMANN & Co.

PASSAVANT & Co.

A. PERSON, HARRIMAN & Co.

F. VIETOR & ACHELIS.

WILMERDING, HOGUET & Co.

The firms whose signatures I have just read are all interested in domestic as well as in foreign dry goods. Their business is to sell the product of manufacturers in Europe and America. They do not ask that duties shall be put at this or that per cent. They simply ask that they shall be made specific. As far as they are concerned you may make them one thousand per cent. It is their business as distributors of merchandise, and as dry goods commission merchants, to adapt themselves to the circumstances whatever they may be. They may have their own private individual views as citizens, as to the tariff in

its political and economic aspects, but as commission merchants they simply ask that the duties may be made specific so that they may know where they are; that they may be relieved of the trouble and annoyance which they daily suffer at the custom-house with regard to the valuation of their goods. And in respect to the other minor reforms which they ask for, the need for them is evident, as it appears to them, on their face. I have prepared a little memoranda here, which, with the permission of the Commission, I will read:

REMARKS ON THE DEFECTIVE WORKING, IN ACTUAL PRACTICE, OF THE AD VALOREM SYSTEM OF LEVYING DUTIES ON IMPORTS.

The law directs that imported merchandise shall be appraised according to the actual market value or wholesale price of the merchandise at the period of its exportation to the United States in the principal markets of the country from which the same has been imported.

Now, it is impossible in ninety-nine cases out of every hundred to say, categorically what this value is. Take, for instance, fancy dress goods. There are in France several "principal markets" for these goods. These markets publish no price lists and in private do not quote uniform prices for the same article. Then, again, the manufacturer, the jobber, and the commissionaire in the same market will ask widely different prices for identical goods, and yet these men are strictly wholesale dealers and their prices strictly "wholesale prices." Again, prices in all markets will vary from day to day, and in an active market from hour to hour. Actual operations are influenced by innumerable considerations; as, for example, the magnitude of the transaction, the reputation, facilities, and necessities of the manufacturer or the jobber, the honesty or greed of the commissionaire, the experience, talent, habits, industry, taste, and needs of the buyer, or the character, standing, and credit of the house he represents. So uncertain and variable are these, that it is no uncommon thing for one buyer to pay 25 per cent. more than another, on the same day and in the same market, for substantially the same goods. So many conditions enter into the estimate of the market value of any given article, and so many difficulties confront the seeker after evidence of actual operations, that the most experienced dealers agree in declaring that, for a majority of goods, the exact market value is an absolutely unknown quantity. This impossibility of fixing the market value encourages unscrupulous shippers to forward invoices which are deliberately undervalued, for these persons know that such a practice is comparatively safe, since that which is a mere question of opinion can hardly become a matter of criminal jurisdiction.

On the other hand, this same uncertainty as to actual value places the importer entirely at the mercy of the custom-house, the custom-house having power to advance the declared value as it may see fit. Thus the ad valorem system proves in practice to be an engine of fraud on the one hand and of oppression on the other. With duties wholly and absolutely specific, these defects would disappear, because the ascertainment of duties would have regard to fixed quantities such as the number, weight, measurement, and count, instead of the value. Thus the importer could not deceive the custom-house, the custom-house could not harass the importer, collusion between importers and examiners could be effectually prevented by the daily changing of examiners to different divisions, and competing domestic interests would have a sure basis whereon to organize their production.

With regard to consular invoices, I think every person conversant

with the subject has long ago come to the conclusion that they are of no use except perhaps for statistical purposes. But the statistics which are gathered by the consuls at their various residences could equally well be collected here upon the arrival of the merchandise.

In regard to the payment of duties by means of certified checks, I desire to say that that is a subject which has been frequently agitated and brought to the notice of the Treasury Department and Congress, and yet no action has been taken in the way of satisfying the merchants on that point. You can easily see that it is a great danger for merchants to have to carry money in large quantities to the custom-house, sometimes for long distances where their banks are up town; they run great danger of losing their money. On the other hand, to transact their dealings by means of checks would be a great safeguard for the custom-house itself. I know that the handling of large sums of money in the cashier's department of the custom-house has resulted sometimes in deficits. That could be obviated if checks were taken instead of money.

With respect to the payment of fees by means of stamps I desire to say this: It is proposed to have an adhesive stamp made for that purpose, and to affix these stamps to the document whereon fees have to be paid at present equal to the fees demanded, or to give the importer the option of having the stamp printed on his documents the same as is done with bank checks nowadays.

With regard to transacting business before a notary public or before an attorney, I will say that that is a simple matter of convenience. Merchants reside great distances from the custom-house in some instances, and it takes up one-half of their time to go to and from the custom-house and attend to the routine of importations, which might just as well be done by a substitute, or the essential part could be done before some well qualified person, such as a notary public living within an easy distance of any merchant's store.

By Commissioner AMBLER:

Question. It is a fact, I believe, that goods of the same designation would necessarily differ very materially in value; is that not so?—
Answer. Certainly.

Q. How would you undertake to arrange this specific duty?—A. If I were called upon to frame a specific tariff on dry goods, I should endeavor, in the first place, to adhere as closely as possible to a rate of duty per piece or article. For instance, I should endeavor to place India shawls at so much each for duty, irrespective of their comparative value. I should endeavor to fix a duty of so much on each India shawl. Nothing can be simpler than that. Where the principle of placing a duty of so much per article or piece is not practicable, I would levy the duty at so much per pound weight. For instance, with respect to silk goods I would have silk goods in the piece pay so much per pound weight. The rate per pound, or the poundage, should be graded according to some inherent and easily ascertained attribute of the article, such, for instance, as the ounces to the square yard, or the threads to the square inch. With respect to silks, the simplest and fairest way would be to classify them by their weight per square yard, counting from one ounce to two and from two to three, and so on, and lessening the poundage as the goods became heavier to the square yard. And so I would put a poundage upon all the materials which enter into dry goods, such as silk, cotton, hemp, flax, linen, wool, hair, jute &c., and where goods are mixed in their components I would dissect them and

let each article pay proportionately according to the component materials. A satin composed of silk and cotton should pay the silk duty for the silk it contains; and the cottonade should pay the cotton duty for the cotton it contains. Each duty should be ascertained according to its classification under the head of silk or cotton.

Q. I understand there would be less difficulty in the application of that principle to silks. But take the woolens, for instance, which range from a very low to a very high price, and as to which the pound duty would seem probably to operate very inequitably. Take these cheap goods, worth about fifty cents or a dollar a yard and yet heavy, and on the other hand fine broadcloths very much higher in price and perhaps lighter or not heavier in weight. How would you get rid of the apparent inequity that would result from the pound duty in that case?—A. You cannot get rid of the principle of inequity in any tariff that you frame. It is impossible to frame a tariff that is going to be absolutely and squarely equitable and fair, and which will be satisfactory to everybody affected by it. These changes that our petition asks for are perhaps going to work greatly to our disadvantage in our business; they probably will. A change to specific duties will cause us great inconvenience and loss for two or three years perhaps, until we adapt ourselves to them. Still we are willing to undergo that loss for the sake of having the thing arranged so that it shall be satisfactory in its workings, at any rate, if not in its principles, to everybody concerned.

Q. I suppose you are quite right in saying that, there must be in any system adopted more or less inequity. But we should guard against any such effect as I mentioned a moment since. Take, for instance, the cheaper grades of clothing worth a dollar a yard. We will assume the two cloths I am about to speak of are of the same weight. The one is worth \$1 a yard and the other is worth \$5 a yard. Those would not be too great extremes, would they?—A. Well, they are rather far apart.

Q. How far would they probably range apart?—A. The ordinary imported woolens for men's wear range from \$2 to \$5 a yard.

Q. Now, suppose you impose a duty of 50 cents a pound on woolen goods (for the sake of illustration), and we will assume a yard weighs a pound, which may be the case. Cloth worth \$2 a yard would pay 25 per cent. duty while the \$5 a yard goods at the same rate would pay only 10 per cent., if I am correct in my figures.—A. If the woolens were classified into various subdivisions, according to their weight per square yard, that would tend to equalize this thing. It would not make it absolutely fair and equal, but it would make it approximately so. You never will get anything nearer than approximately under any tariff.

Q. That would possibly be liable to this objection; that the lower grades of the goods would pay the higher rate of duty, and the higher grades the lower rate of duty.—A. I do not see why it should follow. The woolens are enhanced in value according to their weight; according to the amount of material contained in them.

Q. I had not supposed so, but probably you are right. If that is the case, I can see that it is a very great aid in the direction of your suggestion.—A. The foreign wools that are imported to-day outside of the question of style, where they are fancy goods, and weighing 30 ounces to the square yard, are worth more than woolens weighing 10 ounces to the yard.

Q. Other things being equal?—A. Yes, sir.

Q. But, other things, I suppose, are not equal. One may be a low-priced goods, and the other may be goods that by reason of finish and work upon it has a very high price.—A. You cannot altogether obviate

that difficulty; but that is a very small and insignificant matter when compared with the difficulties we experience to-day under the ad valorem system. The importers could adapt themselves to the circumstances of a specific tariff, and import such goods as would give a reasonable profit under the conditions of the tariff. But to-day they do not know where they are. The custom house can put their prices anywhere they please, and the importer has no recourse. A man may buy goods at fifteen shillings, and have them put up to seventeen shillings here, and he has to submit and pay the difference. Under the specific régime he would know what the duty was in advance, and would be sure that he would not be called upon to pay more than that.

Q. It would certainly be a convenience to the importer.—A. And it would also be a great convenience to the domestic manufacturer, because he would know exactly the extent of protection which was enjoyed, which he does not know to-day. He knows that the nominal duty on silks is 60 per cent., but he does not know how much of that 60 per cent. is collected.

Q. It has been all the time assumed by everybody, I think, that goods should be graded so that there should be a higher percentage upon luxuries than upon the simpler class of goods that are needed by the common people.—A. You will admit that such is not the case with the present tariff. We pay 120 per cent. on overcoatings, and 60 per cent. on silks.

Q. I am quite satisfied it is not so now; but if the principle be a correct one, to impose duties so that the rates are higher on luxuries, we should go in that direction if we can. The suggestion I make is, that perhaps the adoption of this specific duty would, in many instances, operate still more harshly than the present duty; that it would aggravate the present inequity.—A. Of course you cannot frame a tariff off-hand, in a few minutes; it is a question that has got to be studied out. I have no doubt even a tariff on woollens could be framed that would make the subdivisions pretty nearly equitable. There are some other attributes about woollens which could govern the subdivisions other than that of weight per square yard. All those things would have to be looked into, and I have no doubt it could be done as it has been in other countries. I have no doubt a tariff framed entirely on a specific basis could be satisfactorily devised.

Q. And one that would be reasonably equitable and fair in its operations?—A. Yes, sir.

Q. That is a consummation devoutly to be wished. You mention in the paper signed by the firms which you represent here to-day, the matter of the abolition of consular invoices. It was suggested yesterday that the real objection to the present consular invoice was that it was a mere formality; if it was required to be sworn to before some notary instead of the consul it would have some actual value in determining the prices, &c. Is it your opinion that such a result might be obtained?—A. I do not see that it would. I believe that such a course is now adopted in Great Britain. I believe that the jobbers there are required to take oath before a local commissioner as well as before the consul. I do not think that such a course would help us any. The consuls in all countries certify to anything you put before them if it is on clean paper and appears to be written with neatness and regularity, and seems to come from some business house. In fact, it cannot be otherwise. There is no consul who has the time to look into these matters and see whether they are so or not. His business is entirely mechanical with regard to certifying invoices.

Q. Your judgment is that it is a mere formality, which might be dispensed with; that it is a vexation and annoyance with no advantage resulting?—A. Yes, sir; for instance, our various houses in Europe would gladly pay the consular fees to be rid of the annoyance of having the invoices certified. The delay is the chief hardship in this matter. We have to let our goods go into the warehouse for lack of the invoices.

Q. That might possibly, however, be remedied in some other way; that is, to allow them to withdraw their goods upon satisfying the collector in regard to this matter?—A. That would be difficult, because until some form of entry showing the quantities and descriptions of the goods can be shown, it would hardly be safe to let the importer have control of them. We are able to make entries to-day on invoices that are not legalized, by undertaking to present the legalized invoices subsequently. But all that creates work, trouble, and expense, and I think it is unnecessary altogether.

Q. You speak also of paying the duties on various entries, papers, &c., in a different manner from the one at present in use. Would it not be better to make one duty on the whole thing sufficient to cover the cost of it and do away with these little petty fees?—A. Of course, the better way would be to abolish fees altogether. Do you mean to add the fees to the duties?

Q. I was suggesting whether some nominal fee could not be agreed upon. Suppose, for instance, a general entry fee of 50 or 75 cents should be imposed to cover all papers and other expenses; would not that be quite as good as your proposition?—A. The reason why the present method of paying fees is accompanied by inconvenience is because the importer has to go to a desk and pay his fees, and sometimes stand in line for an hour before he can get his turn.

Q. So that, in the event even of the adoption of a uniform fee, he would still have trouble?—A. Yes, sir.

Q. It would then be better to make it a stamp-fee as a matter of convenience?—A. Yes, sir; and it would be well to let the importer cancel the stamp as well as put it on. There used to be a stamp tax on invoices paid by means of an adhesive stamp on the entry, and it was obligatory on the importer to have that stamp canceled by an officer in the custom-house, and that involved, of course, trouble.

Q. There seems to be no reason why an adhesive stamp, which could be canceled, should not be adopted now, the same as is done in the case of checks?—A. Yes, sir. I wish to draw your particular attention to the fact that the firms signing this paper which I have presented are not exclusively domestic commission merchants nor exclusively importers of foreign dry goods; they are both. No firm has signed this paper which is not doing the double business as selling agent of foreign manufacturers and selling agent of domestic manufacturers. It was thought that this petition, if confined exclusively to such houses, would carry more weight with it than if it was signed otherwise, because such houses can hardly be suspected of having any particular interest on the protective or free-trade side of the question, because their interests are on both sides. Their business is to obtain goods from manufacturers, no matter where the manufacturers are, whether in Europe, Asia, Africa, or America, and distribute them to the consumers in this country. If they cannot get silks from Lyons they will get them from Paterson; if they cannot get woollens from Huddersfield they will get them from Massachusetts. Their object is

to get them where they can get them best, and supply the wants of the consumer, the jobber, and the retailer.

It has been stated to you that if an American buyer goes to the factory in Germany or France he cannot obtain goods himself, even if he tenders the money for them. That has been held forth as proof that the manufacturer is a fraud, that he is carrying on a business calculated to defraud the government here. I should like to take this opportunity to disabuse your minds (if any of you are under that impression) of this fallacy that it is necessarily fraud on the foreign manufacturer's part. The commission house, in other words the selling agent for the manufacturers, transacts its business on certain principles. A man will solicit the agency of certain manufacturers abroad, and he makes it a condition with those manufacturers that he is to have the whole of their business in the place where he resides, or none. You will find it just as difficult, if you go to Connecticut or Massachusetts and try to buy goods directly from the manufacturers there, as in the other case. They will refer you to their agents in New York. Just so it is with regard to the foreign manufacturers. Those who have their regularly established agencies here are not allowed by the terms of their agreement with the agents to sell directly to buyers who go to them.

Q. I can readily see that the condition you suggest does exist. Still, what is your judgment as to whether there are in fact considerable efforts at undervaluation by some, at least, of the foreign manufacturers and importers?—A. I will answer that question in a broad way by saying, that everybody who has studied human nature to any extent must know that where there is a large number of employes, such as the examiners in the custom-house, and where the employes are getting, perhaps, \$2,000 a year salary, more or less, with large personal and family expenses, that there will be some of those employes to whom a \$5,000 check is going to be irresistible. That being the case, and knowing that the faults of human nature extend as well to the importers as to the examiners, we must expect and believe, even if we do not know it to be so from actual evidence, that this collusion does exist; that there are importers who are willing to pay to have their goods passed at their own valuations, and examiners willing to receive compensation for passing them. The examiner is, in point of fact, the sole arbiter in the matter. Whether an invoice shall be passed as presented, or not, depends entirely on him, and it is too great a power, in my opinion, to be safely placed in any one man's hands. A specific duty does away with all this difficulty. I suggest with regard to the defects of the ad valorem system that the specific plan does away with them, because it could be so arranged that the examiner, for instance, should examine steel rails to-day and examine woolen goods to-morrow and silk goods the next day. If there was a specific duty it would take no technical or expert knowledge to determine the matter.

By Commissioner UNDERWOOD :

Q. I would like to know more specifically with regard to woolen manufactures. What is the tariff upon coarse woolen fabrics that cost from 50 cents to \$1 a yard?—A. It runs as high as 110 per cent. It is a compound duty of 35 per cent. ad valorem and 50 cents a pound.

Q. I know what the tariff rates are, but I want to know how it works, and what per cent. of duty is actually placed upon woolen goods. The law imposing the duty is worded in such a way that it necessarily takes an experienced man to ascertain the total amount of duty. What is

the per cent. upon very fine cassimeres and broadcloth of the finest quality?—A. The duty is in the neighborhood of 70 per cent.

Q. Are there any woolen goods that run as low as 40 per cent.?—A. I do not know of any. Experience shows us that the cheaper the price of wooleus the higher the percentage of duty is.

Q. What class of people use these cheap goods?—A. Very few of them are imported at present. The importation of them is gradually being abandoned during the last five or six years, because the cheap goods made here have taken the place of them.

Q. What class of people use the finest woolen manufactures?—A. Well, such persons as yourself, and I suppose most of the gentlemen sitting here are wearing them. I suppose you have a foreign woolen suit on now.

By Commissioner AMBLER:

Q. You say that the foreign cheaper goods under the present tariff have been crowded out of the market within the last few years. What has been the effect upon the price on that class of goods? Has the result been an increase or decrease of price?—A. Naturally the result has been a decrease of the price; otherwise the importation would have continued if the foreign manufacturer had always been able to get the price he got before.

Q. Do you mean to say that this class of woolen goods that has been excluded by the 110 per cent. duty has really become cheaper to the consumer since the exclusion?—A. Yes, sir.

Q. Is that remark applicable to the condition of things before the enactment of the present wool tariff?—A. No, sir; I think it results chiefly from the cheapening of the production here, consequent principally upon the greater competition of domestic manufacturers among themselves.

Q. Do you think competition among the American manufacturers has reached this point, that this apparent hardship is not really one to the purchasers of cheap goods?—A. I do not think so altogether, because the foreign cheap article was, as a rule, better in intrinsic worth and wearing qualities than the domestic article. It was a better manufactured article.

Q. So that on the whole, while there has been an apparent cheapening, you have some doubts whether the result to the consumer has been in proportion?—A. Yes, sir.

By Commissioner MCMAHON:

Q. Your note to your first subdivision is: "By means of subclassifications, sealed so as to follow the various grades of each manufactured article, a sufficient discrimination as to comparative cost or value can be preserved." Do you mean that that scaling shall be in any case by cost?—A. In no case by cost; always by some specific value.

Q. Always an intrinsic attribute other than cost?—A. Yes, sir; and some specific line of division.

Q. If such scaling be by counting the number of threads, or number of ounces to the square yard, one or both, in the case of mixed materials, by ascertaining the quantities of the several materials, besides entailing an immense amount of labor on the custom-house officials, and necessarily an increased force, will not that open the door for as much dispute as now in regard to the question of value?—A. I do not think so. The question is one that can never be settled by any rule. It is always a matter of opinion as to what the value of a thing is; whereas

if any dispute arises as to the weight per square yard, or threads to the square inch, or some specific attribute of the goods, such dispute can easily be settled, because it is only a question of intelligent weighing and counting.

Q. You are familiar with the importation of woolen dress goods?—
A. Yes, sir.

Q. Do you not know as a matter of fact of dispute arising as to whether the goods run over four ounces per yard or not?—A. Yes, sir; but I have never known in any such case the least dissatisfaction on the part of individuals. We have had cases ourselves where upon actual weight of the goods after their arrival here they have been found to be different from the weight declared in the invoice. Sometimes particular goods acquire dampness in their transit or dry out; but a good Fair-bank scale will always settle the question.

Q. Would not a scale necessarily be a very complicated one which would attempt at all to approximate the cost?—A. I think not.

Q. Would not there necessarily be a great many gradations in that scale?—A. There might be ten or twelve gradations to each class of goods.

Q. Then, in the case of mixed materials, where an article is composed of silk, cotton, jute, or hair, there would be the number of gradations multiplied by the number of materials, would there not?—A. The gradations would be determined, I presume, by the article itself.

Q. If an article comes in composed of all these materials, would there not be that number of scales, that is the aggregate number of scales or gradations multiplied by the number of materials?—A. Yes, sir.

Q. That would necessarily complicate the matter?—A. It would be merely a question of mathematics, and not necessarily a question of greater difficulty. To-day some duties are determined by the comparative quantities of the different materials in the article.

Q. I know you are familiar with the custom-house business, and I want to get at the practicability of such a matter. With anything like the present force that the government affords for doing the work, is such a thing practicable?—A. I think it is, with about the same force as now employed. It would not take any longer to pass upon a case of goods as to its specific attributes than it does now to pass upon it as to its ad valorem duty. Take the business of the custom-house as it is transacted to-day, where the practice is to take one case out of ten, and, if it is found to be correct, to suppose the other nine are correct also. That principle might be allowed to prevail under a specific regime.

Q. I understand you to recommend the abolition of the consular invoice, alleging one reason that you are delayed in obtaining your goods on account of this requirement?—A. Yes, sir.

Q. Suppose that the consular certification be not required; would you not suffer the same delay? Suppose you have no original invoice and no consular certificate as required, would you be any more able then to enter your goods than you are now? As it is now, you can make an invoice and give a bond to produce the consular invoice. Would it not be the same thing in effect if the certificate was not required?—A. I think not.

Q. Have you not known in your experience where goods have been entered upon appraisement and the production of certified invoices thereto obtained from the consular records or the custom-house has shown that there was a very large difference and the government has

been defrauded?—A. I have heard of such cases. I have never had any come under my own notice.

Q. Then it is possible that the consular invoices are of use in cases where the goods are subject to ad valorem duties?—A. I do not see what use they are. I suppose the class of people you refer to, if they had been smarter, could have done the same thing so as not to have been found out. There are so many ways of cheating that I do not think that the preservation of the consular invoice is going to deter people from cheating, if they want to cheat, and these cases are so infrequent and isolated that it is hardly worth while to compel everybody to have invoices to detect a few fraudulent persons. It is well known that a consul will certify any invoice that is put before him, if it comes from a person known to be doing business in his district. And it is well known on the other hand that the custom-house officers here take no notice whatever of the consular certificate, and place no importance or value on it at all. Under these circumstances we ask ourselves what is the use of this consular certificate; nobody regards it; the examiners take no notice of it. They laugh when you call their attention to the fact that the shipper of these goods has sworn to their value before the consul and disregard it altogether.

Q. In regard to certified checks, I would like to ask you if you can suggest any means whereby the collector would not be subject to loss on account of forgery, &c.? Does your proposition cover the idea of certified checks on a bank?—A. Yes, sir.

Q. Would it subserve the purpose at which these firms aim if you could deposit the money with the sub-treasurer and transmit a certificate of deposit, and let the amount of duty be checked off against that?—A. I think it would hardly be fair towards persons of small capital who have not the means to have a special deposit like that on hand all the time.

Q. Would there be any safeguard on the part of the collector? He is responsible to the government for the collection of the revenue. Who is going to stand between him and forgeries?—A. Certification is generally considered in business circles to be a very good safeguard, and if the government designates the banks whose certification only they will accept, it seems to me there would be safety enough in that.

Q. Would it be any more difficult for these smaller firms to deposit their money with the assistant treasurer than with the bank? If they are going to present checks at all, they have to deposit the money first before they can get certified checks. Would not that practically answer your purpose?—A. Yes, sir; it would nearly answer it.

Q. And would it not at the same time be safer for the collector?—A. I suppose forgery could be practiced there as well as with a certified check.

Q. I will take up the question that was asked by Judge Ambler. Would there be any objection to a specified amount of fee for each entry, of fifty cents, a dollar, or ten dollars, if the fourth subdivision be complied with? That is, you complain that the importers must stand in line sometimes and wait to pay their fees. They can pay their fees at the same time they pay their duties. The importer does not need himself to go to the custom-house. If he can take an oath before a notary public, or if he can transact his business as chartered corporations now do by a designated agent, would not that do away with the complaint made as to the payment of fees? We have no complaint from the chartered corporations because they have agents specially designated to attend to their entire business, and the officers of the cor-

porations never visit the custom-house except to renew their bonds.—A. Well, even if the house delegates a person as its attorney at the custom-house it does not want to have that attorney delayed longer than is necessary in the business.

Q. Will he be delayed if he pays his fees at the same time he pays his duties?—A. Probably not.

Q. If he can pay his fee and duty together, and if he can do the business without the principal appearing there, giving security to the government in case of wrong doing, that would do away with the difficulty?—A. Yes, sir; that would meet the case.

By Commissioner BOTELER :

Q. Did I understand you to say just now in reply to a question of Commissioner Ambler's that the goods of the American manufacturer of the same price are inferior in quality to those of the foreign manufacturer?—A. No; I said that the low class of foreign woolens which have gradually been shut out from this market, were, as a rule, better manufactured than the low class of domestic woolens which have taken their place; they were more solid and better wearing goods.

Q. They were of better quality, you think, than the American goods of that class?—A. Yes, sir; I think better stock was put in them, and more care given to their manufacture.

Q. Does that obtain with regard to other goods, and cottons also, in your opinion?—A. No; I did not comprehend in my remarks any statement to the effect that any low class cottons have been shut out by domestic competition. I had reference simply and entirely to woolens.

By the PRESIDENT :

Q. Allow me to take a specific case. Do you think the American flannels are inferior to the British goods?—A. No, sir; I think not. I had reference in what I said to woolens for men's outside wear, and not to flannels.

Q. That is one of the largest classes of goods worn; and they are now supplied altogether by the manufacturers, are they not?—A. We do not deal in flannels; but I believe such is the case.

JAMES M. SHAW.

NEW YORK, *October 6, 1882.*

The following communication from Mr. JAMES M. SHAW, of New York, in regard to the duties on earthen and glass ware, was ordered to be printed :

I am in favor of a reduction of the tariff on earthenware, now 40 per cent.; on glass, now 40 per cent.; on plain china, now 45 per cent.; and on decorated china, now 50 per cent., about 10 per cent. This could be effected simply by placing the duty on the net cost of the goods, excluding all charges—package, shipping, and transportation charges, commission, &c. This would leave the tariff as now, but reckoned on the goods only. This course would simplify custom-house work and be some protection to importers and dealers in these goods, against the monopoly of the manufacturer.

There are probably one hundred manufacturers of earthenware in the country, and ten thousand workmen who get scarcely enough to support their families comfortably, and these are mostly foreigners who will stay here only while the wages are better than in England. But protection against foreign competition only benefits the few who have the means to carry on the manufacturing works.

Glassware needs little or no protection, as it is produced here better and cheaper than most of the foreign glass brought to this country.

H. B. CLAFLIN ET AL.

NEW YORK, *October 6, 1882.*

The following statement from importers and dealers in flax and jute goods was ordered to be printed:

To the United States Tariff Commission:

GENTLEMEN: In response to your invitation, the undersigned, importers and dealers in flax and jute goods, would respectfully make the following statement:

That the present rate of duty on "brown and bleached linens, ducks, canvas, paddings, diapers, crash, huckabacks, handkerchiefs, lawns, and other manufactures of flax, jute, or hemp, or of which flax, jute, or hemp are the component material of chief value, not otherwise provided for, valued at thirty cents or less per square yard, is thirty-five per centum ad valorem; valued at above thirty cents per square yard, forty per centum ad valorem." (Schedule C, Sec. 2504, Revised Statutes of the United States.)

That these rates of duty, as your petitioners believe and most respectfully aver, are a burden upon the commerce of the country and a needless tax upon the people, and that all concerned will be greatly advantaged both by a reduction in such rates, and by a substitution of one uniform rate of duty in place of the two existing rates, to the end that the class of merchandise above named, the same being more particularly specified in the first six lines of the seventh paragraph of Schedule C, of section 2504 of the Revised Statutes of the United States, may pay a uniform rate of duty, and that such rate of duty may not be in excess of twenty-five per centum ad valorem.

That the reasons why your petitioners entertain the belief that these rates of duty should be reduced and made uniform are as follows:

First. None of these goods are manufactured in the United States, excepting a few coarse fabrics, almost the entire consumption in this country being imported from abroad.

Second. Not only are none of these goods now manufactured in the United States, except as above stated, but your petitioners are of the belief that it is impossible for most of such goods to be manufactured here; because, first, while the raw material, of an inferior quality and suitable to the production of certain kinds of merchandise, is grown in this country, the absence of the necessary moisture in the atmosphere prevents the successful cultivation and treatment of such a quality of the raw material as is required for the manufacture of most of said linen fabrics; and, second, one of the processes in the manufacture of such goods, to wit, the process known as bleaching, cannot be successfully performed, owing to the like absence of moisture and certain other climatic elements, without which such process cannot be carried on.

Third. Large quantities of this class of goods are cut up and manufactured in the United States into various articles of domestic consumption and of export, the most important of which are linen shirts and linen collars. This is already a large industry, notwithstanding the existing excessive rates of duty, as above named, and your petitioners are convinced that if such rates of duty were lowered, so that these articles of wearing apparel could be produced at a reduced cost, this industry would immediately assume vast proportions, and would enable the linen shirt and

linen-collar factories of the United States not only to increase the present domestic consumption, but also to supply, almost entirely, the markets of the Dominion of Canada, of Mexico, and of the various States of South America.

Fourth. In the best judgment of your petitioners, no especial advantage is secured to the government, and only annoyance is secured to the importer by the present discriminating rates of duty. By far the largest portion of these goods pay the lower rate of duty, those paying the higher rate being but a very small part of the total importation of linens; all and parties, both those dealing in goods paying the higher rate, and those dealing in goods paying the lower rate, feel that all concerned will be benefited by a single and uniform rate.

And we therefore respectfully recommend that the rates of duty on said foregoing article of merchandise, the same being more particularly set forth in that portion of the Revised Statutes of the United States above referred to, may be reduced to a single and a uniform rate of duty upon all varieties of said merchandise, without reference to the value thereof, and that said single and uniform rate of duty may not be in excess of twenty-five per centum ad valorem.

And we further ask that the duty on the commission of $2\frac{1}{2}$ per cent. be abolished, as the system of purchasing through commission houses no longer exists.

And we still further ask, that duty be no longer charged on inland transportation, which is simply a discrimination in favor of seaport manufacturing towns.

J. H. WOODFORD.

NEW YORK, *October 6, 1882.*

The following communication from Mr. J. H. WOODFORD, of Boston, Mass., in regard to the duties upon saltpeter and dates, was ordered to be printed:

I beg to present the following, in support of the removal of duties from saltpeter and dates:

Saltpeter is imported into this country from Calcutta, and the duty is 1 cent per pound. It is used almost exclusively by meat packers and powder manufacturers. Most of the exported meat is cured with saltpeter and salt, and very large quantities of saltpeter are used by the large packing-houses in this country, thereby increasing the cost of export meat 1 cent a pound on the saltpeter used in curing it.

Nitrate of soda comes in immense quantities from Chili, and is admitted free of duty. This is used instead of saltpeter in the manufacture of gunpowder to a very great extent, and in this way it amounts to a premium of 1 cent a pound in favor of a poorer article to make gunpowder of, and of a poorer quality than the powder made from saltpeter.

Saltpeter is now only brought as ballast, and at the nominal rate of about \$3 per ton; whereas if there was no duty larger quantities would be shipped, thereby giving employment to more ships and at better rates.

During the six months ending July 1, 1882, 36 ships cleared from Calcutta for this country, with about 30,000 bags, or about 80 tons, to each ship; and this is about the average for years past.

Dates are fruit in its natural state, packed as it comes from the trees, without any preparation, and pays a duty of 1 cent a pound. The fruit comes from Egypt, Arabia, and Persia; and in those countries compose the principal article of food for the inhabitants. If the duty was removed the importation would be greatly increased, thereby supplying a cheap food for all classes, and still not conflicting with anything grown in this country. This would also have tendency toward the employment of more shipping, and would also stimulate the trade with Persia, a country to which our government is about sending a consul.

DAVID CLARKSON ET AL.

NEW YORK, *October 6, 1882.*

Mr. DAVID CLARKSON, of New York, importer of marble, addressed the Commission as follows:

The Commission yesterday heard a statement from Ex-Governor Proctor, of Vermont, in regard to American marble. I will now trespass upon the time of the Commission, and say a few words in the interest of the importers of marble.

The undersigned, a committee appointed at a recent meeting of importers of marble in the block, respectfully beg leave to submit, for the investigation of the Commission, the existing tariff as it applies to this commerce.

The clause to which we refer is as follows:

On veined marble and marble of all descriptions not otherwise provided for, in block, rough, or squared, 50 cents per cubic foot, and in addition thereto 20 per centum ad valorem.

Prior to the tariff of 1864, which now prevails, and which was procured by and for the interest of Rutland County, Vermont, in which county are located the only quarries in the United States which produce marble assimilating that imported, the tariff was, upon the clause under consideration, in act of 1861, 30 per centum ad valorem, act of 1862, 40 per centum ad valorem.

It will not be claimed, we think, that the exigency of the government requires a larger contribution from this raw material than was imposed under the tariff bills of 1861 and 1862, while it will be conceded that the interests of the vast body of consumers in the Northern, Eastern, Southern, and especially the Western States, call imperatively for a reduction in the present tariff.

In order that the Commission may be informed how the prevailing tariff, when reduced to an ad valorem rate, compares with the rates under acts of 1861 and 1862, we would state that under government regulations this marble is now invoiced under three classifications; that the present tariff reduced to ad valorem is equivalent to from 58½ to 77 per centum, according to classification.

The marble represented by this clause constitutes nineteen-twentieths of the entire importations of marble, and is known by all dealers as "white ordinary Italian marble," and easily distinguished from all other marble.

After excavation from the quarries of Italy it is simply squared into blocks averaging about 70 cubic feet, and transported from the quarries to the seaboard for shipment from the ports of Leghorn and Genoa, by sailing vessels or steamers, at usually higher freight than any other merchandise, and distributed from the principal ports of entry in the United States to manufacturers and dealers throughout the country, furnishing employment to many thousand laborers, mechanics, sawyers, and skilled workmen.

It is therefore evident that this marble is strictly a "raw material," and that it largely contributes to the industrial interests of the country.

If the committee has, upon the foregoing statement, convinced the Commission that the present tariff is excessive and not required for the

purpose of revenue, we persuade ourselves that the conviction will also follow that the protection to the one producing interest in this country is unprecedented.

Upon this latter consideration we, however, propose to amplify, and invite the closest investigation. We would preface by remarking that we would willingly accord to the Vermont interest any reasonable protection. More than that should not be expected.

For the statements we now submit we beg leave to refer to custom-house records for their verification.

The marble under consideration is invoiced, as we have heretofore stated, under regulations of the government, at values by it determined.

Classification No. 1, at 3.75 liras per palm, is equal to \$1.30 per foot.

Classification No. 2, at 3.25 liras per palm, is equal to \$1.13 per foot.

Classification No. 3, at 2.50 liras per palm, is equal to 87 cents per foot.

These values are based upon the gold value of the lira, 19.3 cents, the currency certificate of the consul being ignored by the government.

The standard of the palm measurement is, according to custom-house, fixed at 5,555 feet to 10,000 palms.

It therefore appears that under existing tariff the ad valorem rate is equal to from 58½ to 77 per cent., according to classification, or to 72 cents per cubic foot, if we assume that the importations are equally divided among the three classifications.

We cannot hesitate in pronouncing the tariff bill of 1864, as it applies to marble in blocks, as unprecedented in its protection to the one producing county in the United States. To this, however, are to be added other sources of protection, namely, the fact that there is a waste in the sawing of these blocks equal to about 15 per cent., upon which waste the government collects duty; and still further, that the ocean freight, at present \$6 per ton of 13½ feet, is equal to 43½ cents per cubic foot. We need only say in this connection that the cost of quarrying (at the quarries in Vermont) marble assimilating to the white ordinary Italian marble is, as we believe, but 35 cents a cubic foot, and for which the demand is steadily increasing and equivalent to the supply.

In concluding this memorial, we cannot doubt, from the facts herein presented for the consideration of the Tariff Commission, that a conclusion will be reached which will recognize the fact that if there is an article of commerce or of industry contained within the tariff bill upon which the tariff needs revision it is marble in the block.

We therefore, as invited, recommend the following amendment: To strike out in the clause under consideration the following words, "fifty cents per cubic foot and in addition thereto twenty per centum ad valorem," and insert *forty cents per cubic foot*.

In proposing this rate we believe we have adhered to the maxim contained in your circular, "upon a scale of justice to all interests." We have substituted a specific tariff, rather than one specific *and ad valorem*, in order to simplify the collection of the revenue, in which modification we think we have the concurrence of the appraisers generally.

All of which is respectfully submitted.

DAVID CLARKSON.
ROBERT C. FISHER.
AUGUSTUS TABER.

I do not wish to trespass any further upon your time, but I would like, with your permission, to make a few remarks based upon the reports in the morning papers of the interview Governor Proctor of

Vermont had with the Commission yesterday. He represents the large native production of this country, and he tried to convince you that the marble quarries in Vermont were the only ones which conflict in the slightest degree with the business of importing marble. We are informed that the cost of quarrying that marble in Vermont, owing to improvements in machinery, is about 35 cents a foot. According to the statement appearing in the paper this morning he represents that the Vermont quarries produce 2,200,000 feet annually, and that the value of the product is \$4,500,000. According to that showing they would be receiving about \$2 a foot upon a cost of 35 cents a foot for quarrying. That is one fact that I think needs consideration. Another fact that was made known to the Commission was that by the results of American industry in producing marble in Vermont they were able to reduce the value of imported marble from 1867 to 1873 about 40 per cent. That statement would apply to all imported articles as well as marble, because the reduction of prices from 1867 to 1873 was caused by the currency of the country appreciating to gold values. During the war marble was sold at from \$3.50 to \$6 a foot in currency. These prices were followed by the Vermont marblemen, although there was not any additional cost of production, except in the price of labor, by reason of the depreciated currency.

There is one other statement which the governor presented, and it is relevant. He speaks of the amount of duty that was collected from marble during 1863 and 1864. The inference would be from his statement that the tariff of 1864 had the effect of increasing the importation of marble. The tariff of 1863 was about 40 per cent., whereas in 1864 it was 58½ to 77 per cent., showing an increase in the revenues, but he fails to show that there was any increase in the importation. I have drawn off the figures showing the importation of marble at this port for the last ten years, as follows :

Blocks of marble imported.

	Blocks.
1872	3,975
1873	3,746
1874	5,090
1875	3,259
1876	2,686
1877	3,787
1878	2,015
1879	2,660
1880	4,319
1881	2,073

That would give an average for ten years (a decade) of 3,400 blocks—no perceptible increase; whereas the statement presented to you by Governor Proctor would show that the Vermont quarries were truly, as they express themselves, “prospering.”

JAMES C. MCANDREW.

NEW YORK, *October 6, 1882.*

The following communication from Mr. JAMES C. MCANDREW, of New York, in regard to the duty on emery ore, was ordered to be printed:

As an importer of emery ore and manufacturer of the same into grain emery, I desire to make a few observations in writing with a view to the better adjustment of the duties thereon and the alleviation of the trade, which, for some years past, has been a suffering industry and conducted at a serious loss to those engaged in it.

Emery ore as mined is imported from Asia Minor, and pays, at present, a duty of \$6 per ton of 2,240 pounds. This ore, unavoidably, has attached to it extraneous matter to an extent equivalent to a loss of 33 per cent. in its manufacture; that is to say, a ton of emery ore, when worked into grains of emery, will only produce 66 per cent. of its weight; the residue is partly flour, say to extent of 10 per cent., and of little or no value and is sold as opportunity offers, at about one-half cent per pound, which incurs a considerable loss to the manufacturer after deducting cost of making, packages, rent, insurance, and handling; the residue is dirt or total waste. Thus we have from a ton of ore as imported, 66 per cent. of grains of emery and 10 per cent. of flour.

The present existing tariff reads as follows (1265, Heyl's Digest of Statutes): "Emery grains: 2 cents per pound; emery ore, \$6 per ton; emery manufactured, ground, or pulverized, 1 cent per pound." The intention being, doubtless, that emery manufactured into grains should pay 2 cents per pound and the flour 1 cent, but, owing to the wording, emery in grain, manufactured in England and elsewhere from *free* ore, is imported at a duty of 1 cent under the description of "emery, ground or pulverized."

I respectfully submit that this is serious hardship to the trade, and request your honorable board will listen to our complaint and alleviate our trying position by placing emery ore on the free list, and providing that flour of emery and grains of emery under the title solely of "emery, manufactured," should pay a duty of 2 cents per pound.

THEODORE C. BATES ET AL.

NEW YORK, *October 6, 1882.*

Mr. THEODORE C. BATES, of Worcester, Mass., representing the Corset Manufacturers' Association of the United States, addressed the Commission as follows:

There appeared before you, a few days ago, a gentleman (Mr. William P. Copeland) representing Mr. M. Cohn, of this city, asking for the levying of a duty of 35 per centum on horn strips imported into this country to be used in the manufacture of corsets, instead of whalebones, used formerly to a great extent. In behalf of the manufacturers of corsets in this country, I appear to protest against that suggestion. This article has always been considered as a raw material, and therefore should be admitted free of duty. It may be known to you that this is a comparatively small industry in this country. The manufacture of corsets here was not begun to any considerable extent until 1871. At that time there was a duty of 32 per cent. placed on corsets of the value of \$6 a dozen, and on corsets above that value a duty of 35 per cent. The manufacture of corsets has since that time developed very rapidly, until to day, I suppose, there are not less than 10,000 or 15,000 people employed in the business. I know of no industry that has grown more rapidly than this. It is the belief of my associates that were the tariff to be reduced to any considerable extent, or abolished, and a duty levied upon horn strips, as has been asked by my friend Mr. Cohn, it would result practically in shutting up the corset manufactories of this country. We have never been able to compete with the cheap labor of Germany before, and the business was never developed until a protection was afforded by the levying of a duty on corsets and the placing of horn strips on the free list.

Now, not to seem personal or to reflect at all upon the statements made by the attorney of Mr. Cohn, it may be proper, for the information of the Commission, to state that there have been two or three parties in a small way, with small capital and inexperienced help, who have attempted to manufacture horn strips in this country. But, after failing to succeed, little by little their machinery has fallen into the possession of Mr. Cohn, it is believed, from the fact that he has offered all his machinery to the Corset Manufacturers' Association at a very low figure; instead of being \$50,000, as stated, it would perhaps not exceed \$10,000 or \$15,000 in amount. The manufacture of horn strips is peculiarly a manufacture belonging to France. Almost all the horn strips manufactured for the use of corsets all over the world are manufactured in Paris. A few are made at Cologne; but principally at Paris. It is an industry which has failed to be successful anywhere else on account of the peculiarity of the labor required; and I question whether it will ever be carried on in this country to any extent.

By Commissioner BOTELEK:

Question. How much capital is invested in the manufacture of these corsets in the United States?—Answer. I should say \$4,000,000 or \$5,000,000.

Q. And how many operatives are employed?—A. Ten thousand to

15,000, I should say. I do not believe that ten years ago there were 500 people engaged in the business. It is an industry not over ten years old in this country, and is growing rapidly.

By Commissioner McMAHON:

Q. Is there any other article than that which comes in bundles and strips for the manufacture of corsets which is commercially known as horn strips?—A. No, sir; I know of no other.

Q. It is alleged that what is known as "strips of horn" is used for glue stock.—A. I never have known of it. I have been engaged in the manufacture for several years, and know nothing of that sort being done. This same party, Mr. Cohn, a few months ago endeavored to procure, through the custom-house in New York, a decision that horn strips used in the manufacture of corsets was not the article known as horn strips to the trade; and, through his instrumentality, large invoices were stopped in the custom-house, and the matter was referred to the Secretary of the Treasury, in Washington. But, upon representations made to him by myself and others in the trade, the decision was overruled, as there was no question in the minds of the authorities as to what horn strips were, and the goods were released by order of Secretary Sherman, very much to our satisfaction.

Mr. ALEXANDER J. MAYER, of New York, said:

I desire substantially to indorse the statement which has been made to the Commission by Mr. Bates. I was formerly engaged in the manufacture of corsets. I appear before you because Mr. Cohn has undertaken, through the statements made to you by Mr. Copeland, to present a case which I believe to be injurious to the manufacturers of corsets. The same gentleman (Mr. Copeland), as attorney for Mr. Cohn, appeared before a Senate committee in Washington in 1873 and endeavored to have the duty taken off, and I furnished him with a bundle of horn strips, which were used before the committee at that time, to induce it to recommend that the duty be taken off. There is no other article known as horn strips except the one used by corset manufactures. There have been attempts made to befog people about the matter, but they have not been successful.

The corset industry of the United States has grown very largely, as stated by Mr. Bates. I went into the business in 1871 with a firm, and we did a business at that time of \$160,000 per year. In the course of five or six years we raised that amount to \$850,000. I merely mention this to show you what the growth of the business has been. Fully 10,000 operatives are directly employed in the manufacture of corsets in this country, and indirectly probably as many more. It is essentially a French industry. No other nation has ever succeeded in developing the business, although repeated attempts have been made to do so. The business has been started in Germany, Belgium, England, and Spain; but in all cases has resulted in failure. It is not a question of labor at all; labor forms the smallest item probably. It is skill and skill alone which makes it a successful business. I remember a firm in Cologne, Germany, which undertook the manufacture of horn strips in that city. They imported their skilled help from France, and went to great expense, built necessary machinery, and spent large sums of money in the business, yet after three years they failed and were sold out by the sheriff. They could not compete with France. There is something in the manufacture of horn strips that no one outside of Paris seems to succeed in. There was a factory started 40 miles from Paris, where

they attempted to make them, but they made a very inferior article. In Germany a large number of corsets are made, but the German manufacturers import the horn strips from France. In turn, a large number of merchants import cheap corsets from Germany. Horn strips are an essential feature in the manufacture of corsets. They are almost entirely a raw material. The horn is imported from Calcutta, Bombay, and Madagascar. A peculiar kind of horn only can be successfully converted into horn strips, as it requires a certain amount of elasticity to withstand the pressure. Formerly, when the United States produced whale-bone, and when it was cheaper than now, there was no occasion to use horn strips. But now that the price of whale-bone is so high it cannot be used, and these horn strips have been substituted. Three different establishments have attempted to make horn strips in this country. They undertook the business since the duty on horn strips was taken off. The protection did not serve as an inducement to those people; they knew if they could succeed in making the right article that the labor employed was the smallest part of the expense. Mr. Cohn bought up a number of bankrupt establishments here, and, now that he has succeeded, he comes before you and wishes a duty to be placed on the manufactured article, so that he may be able to sell his machinery to advantage. He has tried to get all the manufacturers of corsets to join him and buy out his machinery.

ARTHUR LIVERMORE.

NEW YORK, *October 6, 1882.*

The following communication from Mr. ARTHUR LIVERMORE, consul of the United States at Londonderry, Ireland, in regard to the duty upon potatoes, was ordered to be printed:

At the request of persons engaged during the last winter and spring in exporting potatoes from Londonderry to the United States, I beg to bring to your notice that such exportation was conducted to a very considerable extent from various ports in these islands; that the great weight and bulk of that commodity in comparison with its value render such traffic impracticable except under very extraordinary conditions of scarcity in the United States and abundance here, affecting the harvest of that article concurrently. That such conditions make the commerce referred to of great importance to both parties to it, but especially to our own people, to many of whom it presents itself as a measure of relief from want. That the existing duty of 15 cents on the bushel is under any known circumstances almost prohibitory, and that it does not operate as a protection to any industry in the United States, because it is only under the extraordinary coincidence of abundance and scarcity described that the commerce is ever undertaken or thought of.

Under any conditions, so far as Ireland is concerned, such commerce would amount to nothing more than an exchange of potatoes that exist in excess, for corn that the Irish farmers desire, but which they certainly can, at some loss, dispense with, in the process of fattening.

In brief, the exportation of potatoes from any foreign port beyond seas to the United States can never be undertaken except under conditions that entitle it to be regarded almost as a measure of relief to our people, and which secure to the same people a market that would not otherwise exist for their corn.

It is in consequence of the request of the parties referred to that I have taken the liberty of making these suggestions, and not because it seems probable that the Commission would otherwise omit to give the matter all due consideration.

W. G. CRENSHAW.

NEW YORK, *October 6, 1882.*

Mr. W. G. CRENSHAW, Jr., secretary of the Sulphur Mines Company, Virginia, addressed the Commission as follows:

A statement was made to the Commission, during its session at Richmond, Va., in reply to Mr. Joseph Campbell's testimony respecting pyrites. We now beg to hand to you on your printed form a suggestion that you make the duty on pyrites \$3 a ton. If the present tariff law was enforced, the duty would be about \$2.70 or \$2.80; but on all the pyrites coming in this year no duty has been collected on the 2½ to 4½ per cent. of copper contained in it. It has come in under the head of unenumerated ores, and has only paid a duty of 20 per cent. on a valuation of \$3, while some of the ores shipped from Spain and England have been valued at from £2 4s. to £2 8s. So that if these Spanish ores were valued at the same valuation placed on them when they get to England, they would pay \$2.70 to \$2.80 a ton. If there was a specific duty of \$3 to \$3.50 a ton there would be less chance to evade the law.

The industry in this country is a new one. There is plenty of pyrites ore in this country, and the ore we have at Taylorsville is purer than the Spanish, and is entirely free from arsenic, while all the Spanish ore has arsenic in it. I would like to file this paper with the Commission showing the value of the importation of Spanish pyrites ore into Great Britain during the last three years:

Quantity and valuation of pyrites imported into Great Britain during August and for the eight months ending August 31, 1882, compared with same periods in 1881 and 1880. See pages 10 and 11 of the last board of trade returns (August, 1882.)

	August.			Eight months ended August 31.		
	1880.	1881.	1882.	1880.	1881.	1882.
Tons.....	52,328	55,510	51,197	480,245	382,335	440,060

Equal to.....	\$11 77	\$10 70	\$10 70	\$11 53	\$10 70	\$10 94

I am requested to submit a paper on the same subject, by Mr. William H. Whitmore, treasurer of the Milan Mining Company, of Boston, in which he states the reasons for increasing the duty on pyrites:

Until the past year little if any duty has been collected on pyrites, as our sulphuric acid makers have been content to use brimstone, although the cost of the acid was thereby 50 per cent. higher than that made in England from pyrites. The Spanish companies now are trying to obtain control of the market, just at the time when the new demand is leading to the discovery and working of American mines.

As representing one of the most promising mines of New England, situated at Milan, N. H., I would present the following reasons for a reasonable rate of protection: We need it because all mining is hazardous and capital is not readily obtained for enterprises where a great monopoly is to be fought against. The Spanish mines produce mainly pyrites carrying copper to the extent of 3 to 7 per cent., which require to be roasted to free them from sulphur. I am informed and believe that during the past year the custom-house has not collected the full duty on the copper in Spanish or Canadian ores imported. The law is plain, requiring 3 cents per pound on the fine copper. There is no difficulty in ascertaining the amount of copper there by wet assay.

But by some error I am told that the copper has been estimated by a dry assay, which allows about 1.3 per cent. to escape duty; *i. e.*, if the pyrites contain 3 per cent. of copper, they pay duty only on 1.7 per cent., &c.

As to the incorrectness of dry assay, see Lunge, i, p. 100.

There is no excuse for this allowance, as the copper is really there, is perfectly salable by the actual percentage, and is really extracted. This error at least should be corrected.

But there is nothing to prevent the Spanish or Canadian miners, if all duty on pyrites is withdrawn, from importing ores with 5 or 7 per cent. of copper free of duty. These ores are pyrites, and except by assay are not to be distinguished from those without any copper.

I do not presume that the Commission will recommend free copper, and if not they ought to levy duty on just such ores.

The new market created for cupreous pyrites will have a vast effect upon mining in this country. Mines which would not pay to work for copper alone will pay if the sulphur can be sold. There is no doubt that explorations will be made and new mines discovered, whereby the price of sulphur and copper will be lessened from the products of our own mines. But, like every other industry here, this branch requires a moderate protection at the start. If the Spanish and Canadian miners can get their copper in free of duty, they will sell their sulphur at prices which will effectually stop all American mines.

I need not say that it costs more to mine a ton of pyrites here than abroad, and especially to open and develop a mine in competition with such an immense and well-established rival as the Rio Tinto. But the mines exist here, and only wait for a chance for development. The mine I represent produces pyrites equal to the best Spanish or Canadian ores, free from the arsenic which contaminates all ores from those sources. It is not a small matter to have even our fertilizers made from a pure sulphuric acid, free from arsenic. But if the American ores are shut out by a low duty on foreign ores, nearly all the commercial acid will contain an amount of arsenic which is dangerous. For this reason American mines should be encouraged.

There is no fear that the price of American pyrites will be too high. Competition here will be active and each section of our country has already well ascertained deposits of the ore. But these cheap ores cannot be worked if foreign ores are admitted free of duty.

I can only add that the 50 per cent. of iron in the pyrites, is, after the sulphur and copper are extracted, very valuable. It is especially adapted to the Bessemer system. It certainly ought to pay a specific duty. It is not like iron ore, for it costs nothing to treat. As it exists in the pyrites, so it will be found here after the washing and other treatment as pure iron, differing from pig-iron only as being in a finer shape. Yet pig-iron pays \$7 per ton.

It seems reasonable to ask for a duty of \$1 per ton on all iron or cupreous pyrites as such, being a duty on the iron therein, and also in the case of cupreous pyrites to exact the full duty of 3 cents per pound on the copper actually there. The whole system of dry assay is foreign to our customs system. It is an artificial plan by which the buyer and seller *pretend* that there is less copper in the ore and then make a higher price for the smaller quantity. At least we are entitled to have the duty fairly ascertained and paid.

I am prepared to lay before the Commission any required proofs of the fact that the Milan mine produces first-class pyrites, and I have no doubt that equal satisfaction can be given by other American miners.

I would like to add, that in one regard Mr. Whitmore seems to think a duty has been paid on the importation of these Spanish ores to the extent of 1.3 per cent. on the copper. But the custom-house officers in New York tell me that only 60 cents per ton has been charged on the ore imported here. Nothing has been paid on the copper; and if the duty is to be collected by the amount of percentage of the copper contained, every cargo must be analyzed, as it varies greatly in different cargoes. So that it would take very careful analyses and sampling to get at the principal components in the article.

By Commissioner BOTTLER :

Question. It has been stated to the Commission that this country could not be depended upon at all for the supply of pyrites, and that the quality brought from abroad was much superior. What do you know in regard to that matter?—Answer. Before taking any steps in regard to the mine I am connected with, I took two shipments of the ore to the best

burners in Manchester and Glasgow and had them burned, and I can state that they are perfectly willing to take the ore if we can let them have it at a fair price. They say it is the best ore they have ever burned; better than the Spanish. Nearly the whole supply of Great Britain comes from Spain. About 600,000 tons are imported annually. The freight from this country to England prohibits the shipments of it cheaply, and therefore I do not suppose we shall be able to dispose of any in England. We are burning it very satisfactorily at our works in Richmond.

By Commissioner UNDERWOOD :

Q. Do you know anything about the works established at Atlanta, Ga., where they are working pyrites from the Tallapoosa mine?— A. I was there last winter, and saw Mr. Pratt, who has charge of the works. They bring it from a rather inaccessible point ten or twelve miles from the railroad, so that they are laboring under great difficulties; but they are making acid from it without any trouble. The statement made before the Commission by Mr. Campbell that there was no pyrites in this country is not sustained by the facts. But the development of the mines will take a little time and capital.

LYELL T. ADAMS.

NEW YORK, *October 6, 1882.*

The following communication from Mr. LYELL T. ADAMS, consul of the United States at Geneva, Switzerland, addressed to the Secretary of State, and transmitted to the Commission through the Secretary of the Treasury, in regard to the duty upon musical boxes, was ordered to be printed:

I inclose herewith a paper signed by the principal manufacturers of musical boxes at Geneva, who are desirous of securing a reduction of the duty upon their goods imported into the United States. I respectfully request that the department will bring these documents to the notice of the Commission upon the revision of the tariff, now in session, or take whatever other measures it may think necessary to secure their consideration by the proper authorities.

The plea is founded upon the facts, first, that the present duty of 30 per cent. ad valorem practically excludes the goods from the American market, to the loss alike of manufacturer here, the purchaser in the United States, and the revenues of the government; and second, that the increased exportation expected to follow a sufficient reduction of the duty could injure no American industry as the article in question is of Swiss manufacture exclusively and for reasons given is almost sure to remain so.

I take an interest in the matter for the reason that to the best of my knowledge and I think without an exception the exporters in Geneva have shown entire loyalty in the preparation of their invoices, and that in face of the steady decline of their trade with the United States; perhaps their most important market. It would, I think, be an advantage to all concerned, and would certainly have a happy effect among the business classes of Geneva and throughout Switzerland if the prayer were granted.

I add a table showing the decrease in the exportation of these goods to the United States from the city of Geneva since the beginning of 1881. On the other hand, as appears from a second table, the total exportation from my district, to which the manufacture is confined, shows a considerable increase since 1879, when the effects of the long commercial crisis in Switzerland began to pass away. This increase is wholly in the exportation from Sainte Croix, which produces an inferior article at cheaper rates, shipped wholesale, and mostly on consignment to branch houses in the United States. It may be known to the department that this exportation has been under suspicion by the customs officers for some time, and in one case at least has led to a formal investigation and an advance in the invoice prices. The goods sent from Geneva are of the most perfect kind produced, and are almost always sold here to single purchasers at retail.

LYELL T. ADAMS,
Consul.

GENEVA, *August 29, 1882.*

The following is the paper referred to in the foregoing letter:

ASSOCIATION COMMERCIALE ET INDUSTRIELLE GÉNEVOISE.

CHAMBRE DE COMMERCE,
Genève, le 28 Août 1882.

The vast field which the United States of America offers to all commercial enterprises, is to a great extent a forbidden land to the musical-box trade, owing to the almost prohibitory duty which is levied upon this class of goods.

With 30 per cent. to add to the wholesale price of a musical box it becomes an unapproachable luxury for the class to which it would be a real boon.

Apart from this side of the question comes the vital consideration whether this high duty of 30 per cent. is necessary. Unlike a quantity of other goods, the manufacture of musical boxes has never left this country, in which it originated, and all goes to show that there is little or no probability that it will ever leave it.

So high a duty is conceivable where a national industry has to be protected and developed, but for the following reasons this consideration cannot exist in the present instance.

The mechanical portion of a musical box—the cylinder (barrel), wheels, &c., in a word, the blank is alone susceptible of being made by machinery. When we come to the truly musical and artistical portion, no machinery, however perfect, can replace the eyes and above all the ears of an expert workman or workwoman.

The marking of the music on the cylinders (piquage), the verification of the same (justifiage), both operations having to be performed from the written music, requires human intelligence to interpret the composer's ideas.

Finally the finishing (terminage), above all, needs the ears of an experienced musician to judge whether the effect produced is in accordance with that intended by the composer.

In short, three-fourths of the work must necessarily be performed by human hands. Several attempts have been made to substitute mechanical for human labor, but all alike have failed, and it is an undeniable fact that labor is far cheaper in Switzerland than in the United States.

This city being visited by vast numbers of American citizens, our retail department has given us a very good opportunity of judging how far the present tariff goes towards preventing many would-be purchasers from becoming actual buyers. The question invariably asked is, "What is the duty on your goods into the States?" On being informed of the state of the case, which makes the price of a 100-franc instrument into 130 francs, it will be readily understood that many purses remain closed, the duty destroying in their mind the real advantage of buying in the manufactory, and the consequence is, to the disadvantage of all concerned, buyer, seller, and the United States revenue, no sale is effected. All these reasons combined bear out the statement that there is but little chance of this industry ever emigrating, and that by reducing the tariff on musical boxes the United States of America, whilst conferring a favor on manufacturers and consumers, its own revenue will be benefited by an increased importation of these articles, for experience teaches that, far from being a loser by reducing import duties, all countries have on the contrary reaped large increase of this branch of revenue.

Exportation of musical boxes to the United States from Geneva and Sainte Croix (invoiced at Vevey), 1881 and 1882.

D. C. ROBBINS.

NEW YORK, *October 6, 1882.*

MR. D. C. ROBBINS, of the firm of McKesson & Robbins, New York, importers of drugs, &c., addressed the Commission as follows:

We take pleasure in acknowledging the receipt of your printed circular, inviting opinions in regard to changes that are desirable in the present tariff, in connection with the trade in which we are especially interested, as importers and dealers in drugs and chemicals, as well as manufacturers of chemical and medicinal preparations. The alphabetical list, which we submit, has been carefully prepared from Heyl's compilation of 1879. We beg to remark that in 1870 the drug tariff list was carefully considered by Congress, and a very extensive selection of articles was added to the free list, and hence there are, at present, but few crude drugs or natural products to be added to the free list. We find in Heyl's compend but twenty-six enumerations which belong to this order of products; and of these articles and classes of articles, the most important are the oils, all of which, whether known as fixed or expressed or essential, are classed in the French customs list as "matières," or natural products; or, if you please, raw materials, the last designation being used commonly while it is a very indefinite term.

The next most important subjects to be considered, after the crude list which we submit, as we view the situation, is the proper reduction that should be made upon protected chemicals, and a simplification of the duties upon medicinal goods, some of which, like quinine, for example, are free, while others pay 40 per centum duty. Indeed, it is very difficult, at times, to assign the correct duty upon these goods; and frequent disputes occur in regard to the proper status of commodities; for example: Cod liver oil has always paid 20 per cent. as a commodity of commerce; while when imported, as supposed, for medicinal purposes, it has been taxed at 40 per centum. Sulphate of quinine has been added to the free list because it is an important medicine, while all the other chemical products of cinchona bark, which are nearly as valuable, pay 40 per centum because they are medicinal products in place of 20 per centum, which is the duty on chemical preparations. We will add to these remarks upon the general subject of the tariff, that, in our opinion, altogether too much importance has been attached of late years to specific duties as a substitute for ad valorem rates. The worst abuses that exist in our protective list are in the specific form.

For numerous very excellent reasons, all revenue duties should be, as a rule, specific, and all protective duties should be ad valorem.

Our government statistics show that the average annual import quantity of all articles varies but little while prices vary greatly, and hence while specific duties are themselves preferable for the government and for the honest importer, the government can much more surely rely upon a stated revenue from specific than ad valorem rates. On the other hand all protective duties, as a rule, should be ad valorem, because all protective duties in the interest of commerce and in the general interest of the country should be reduced to the lowest possible sufficient limit for proper protection, and with the lowest necessary duties the manufacturer cannot afford to accept a specific basis. For example, quinine salts vary not infrequently more than 100 per centum in

price. The range of prices in the past has been during a single year from \$1.50 to \$3.50 per ounce, and as 10 per centum is considered to be the lowest limit for adequate protection, the manufacturer cannot afford to take his specific duty of 15 cents per ounce, as in case of an advance to \$3.50 per ounce his protection would be reduced from 10 to about 4 per centum. Quinine, by the bye, has frequently touched \$4 per ounce.

Furthermore, the question before the country in regard to revenue duties is always a simple one of more or less revenue, to be determined by the need of the government and the quantity of import of any particular article. While disputes about adequate protection can only be properly measured by Congress in general and by the country at large through the ad valorem system, experience has proved that ad valorem rates within a low limit of 10 or 20 per centum are not specially objectionable, while it is dangerous to apply very high ad valorem rates, because such rates tend to promote undervaluation and fraud in the entries of merchandise.

We notice, among thinking men and persons familiar with the subject of customs revenue, that ad valorem rates are growing in favor; but high ad valorem rates can never be safely imposed without additional legislation in regard to the valuation of goods; and we think that all foreign valuation should be discontinued, and home valuation, subject to the penalty of seizure by the government, as is usual among all European nations, should be substituted. The usage in Europe is to let the importer enter his merchandise at his own valuation, the merchandise to become the property of the government if the valuation is disputed; the option of the government being to receive the duties at the importer's valuation, or to receive and pay for the goods.

When Mr. David A. Wells, in his first report made to the Treasury Department after the war, alluded to the business I represent here, he said that while it embraced more than four tenths of the tariff list in its enumeration, and was most important in its relation to all other branches of business, it was in the most discordant state of any branch of the tariff laws, and he had not been able to find anybody who would give the matter consideration. This remark of his attracted the attention of the trade, and in 1867 the American Pharmaceutical Association appointed a committee to take up the subject and report upon it carefully. The making of the report fell into my hands. I made a report, and I have with me the only copy of it which I have left. In order to prepare myself for the work, I went to Europe and procured copies of the different European tariffs, and I presented in this report an analysis of the four principal tariffs of Europe as they applied to the drug trade—the English, French, German, and Russian. Mr. Wells saw this report of mine, and I had a correspondence with him in regard to it, and it led to a personal interview. In 1869, when he made his last report, he took the same basis and presented thirteen European tariffs in connection with the subject, for the information of the country. The conclusions I arrived at were these: That the only true basis of tariff reform lies in adopting the method of the French tariff. They divide all commodities into two great classes—*matières* and *fabrications*—materials and manufactures. They class as materials all substances which are not made by man, but which are formed by nature, and they class as fabrications all articles which are made or can be made by man. Many of the most important chemicals are made by nature, and yet they are classed as among manufactures. Another important fact is, that they place their chemical products at the end of the natural products and preceding all other

manufactures, as they should. They place very low duties on raw materials or natural products. The term "raw material" is very indefinite as we use it. But they place low duties on those, and on chemicals also they place low duties. Chemicals are the result of a scientific combination of raw materials. They are not really manufactures, as I view it. I believe in the absolute necessity of protecting the skillful mechanic of this country, and as a chemical manufacturer, I believe in low duties on chemicals.

Following this report of Mr. Wells in 1869, there was assigned to Mr. Wood, of New York, our member of Congress, the charge of this subject. He called upon myself and others, and we had a number of interviews to consult as to what should be our principle in the reduction of the thirty millions which was to take place in the revenue. In the first place, he gave us the privilege of reducing the duties on chemicals two and a half millions. We went through the entire list, and the great bulk of the free list of the present tariff is the result of that work. We used the two and a half millions as economically as we could, and put everything we could in the free list, for the purpose of simplification. But they threw out the essential oils. I do not think Congress had time to deal with the matter intelligently.

The same remarks which Mr. Wells applied to our business fifteen years ago are true to-day. While the range of subjects has been greatly limited by this work which was done, and which culminated in the bill of July 14, 1870, the same facts which Mr. Wells called attention to fifteen years ago exist to-day, as, for instance, in regard to the matter of quinine. Why should quinine be admitted free of duty, and the other alkaloids, nearly as valuable, pay 40 per cent. duty? They ought all to pay a small duty? I advocate a duty of 10 per cent. on quinine and 20 per cent. on the others. Why should one essential oil pay a duty of 200 per cent. and another one alongside of it be admitted free of duty—made free at the instance of the particular manufacturers who want it free? They should all be free, according to my opinion. In other words, what does remain of our business to be attended to is really the most incongruous and the most discordant, I think, of any other branch of the tariff.

By Commissioner BOTELER :

Question. Have you made a list of the different articles on which you recommend a reduction of duties?—Answer. Yes, sir. I have the list here.

By Commissioner PORTER :

Q. Do you not think there should be a special chemical schedule in the tariff list; that it ought to be taken from under the head of "sundries," where it is at present?—A. Yes, sir; and I have pursued exactly that plan. I have put all my crude goods together, and then the chemicals follow. It is absurd to try to make a tariff on any other principle than the one the French people have followed. The beginning of all knowledge is classification, and the beginning of all tariff reform must be in the proper classification of all articles. Here you have it. I have two of these; one of them I presented to Mr. J. S. Moore. Mr. Moore made a remark here the other day that the manufacture of quinine was a monopoly. Now, gentlemen, there are five manufacturers of quinine in this country and about thirteen in Europe. These are enough. The trouble we have to contend with is in getting a sufficient quantity of the bark. The business is a monopoly just the same as Henry Ward Beecher's preaching is a monopoly; every man can preach, but no one can preach as he

does—or, at least, so his people think. Landseer's paintings are a monopoly in the same way, because he painted better than other people could. For the manufacture of quinine there is required a combination of a number of difficult things. It requires, in the first place, theoretical knowledge to begin with, because the processes are never final, and the methods of manufacture are always improving. It also requires an intimate acquaintance with the manufacturing business. There are but few persons who have such knowledge or have time to acquire it. It also requires a large capital, which is sometimes difficult to secure; also, high commercial ability. The ablest and most successful manufacturers of quinine in this country and in Europe are not so much men of education as they are men of high commercial ability. There can be no greater mistake than to say that the manufacture of quinine is necessarily profitable. It is only profitable when it is properly conducted. The great object in view is to get the price of the bark down and the price of quinine up. We refused to join the other manufacturers in the demand for a 15 per cent. duty; we ask only for a 10 per cent. duty. We believe in the lowest protective duties that will place us on a level with the foreign manufacturer. We considered ourselves rather aggrieved and insulted by the action of Congress putting our special article on the free list, while all other articles are protected. This subject has been fully presented to you by a partner and son of mine, and I do not propose to go into it in detail except to say this in regard to what Mr. Moore told you. Mr. Moore is a good friend of mine, and we are intimate personally, and while as an employé of the custom-house he did make himself familiar with very much that pertains to the customs department, yet he is supremely ignorant of the specialties of our business. After the passage, as the result of newspaper agitation, of this "free quinine" bill, he came into my office and, in a friendly, jolly way, said, "What is this cinchonidia?" I said, "Mr. Moore, you are accepted by the press of the country as a man who knows all about cinchona products; you ought to know what it is." But I found he never had heard of it. I told him it was an article largely consumed in the Western States in the place of quinine because it was cheaper. He said, "They say the duty is left on it." I said, "Yes; we think the duty ought to be 20 instead of 40 per cent.; but it will help us out a little."

By Commissioner AMBLER :

Q. In answer to an inquiry I addressed to Mr. Moore the other day he assigned as a reason why the 10 per cent. duty, which he admitted was a very low duty, should not be levied, that 5 per cent. was about the margin of profit at which quinine was, as a rule, put on the market, and therefore 10 per cent. was an exorbitant duty, and would allow you, for instance, at any time to crowd the foreign article out.—A. Quinine is a very close article in the trade. It is usually sold at from 2½ to 5 per cent. profit; 5 per cent. is considered a large profit on quinine. In its manufacture there are large risks which have to be taken. Money can only be made in the production of quinine by extensive arrangements for the supply of the bark. The bark is the thing that controls the whole matter, and the risk of the manufacturer is very much greater than the risk of the wholesale merchant. His arrangements must be made far ahead, away off in South America or Ceylon, and 10 per cent. is not an exorbitant duty to put upon quinine; it is a very low rate of duty. Although I do not believe in free trade myself, I would say give us free trade in everything, and we will not ask for any duty on quinine. Commercially speaking, however, no country

that has only a single market can afford to adopt a purely free-trade basis. I believe free trade is a desirable thing to be arrived at, and I believe that in a bungling way we are on the right track in this country.

People talk a great deal about foreign commerce; but in the name of common sense, what amount of foreign commerce could accomplish what we desire? Anybody will take your corn, cotton, and raw products, but what we want in foreign commerce is what England has secured. We want an ability in foreign commerce to distribute the work of our skillful operatives. In this matter of quinine and bark, the great injury done to the country is, that it has destroyed our commerce in bark. It is not the five hundred people that you throw out of employment by destroying the industry, but it is the loss of the trade, for this bark is paid for by us in all sorts of commodities. This bark is found among savage and semi-civilized people, and we want the commerce of those countries, and if we cannot manufacture the bark here, it is not coming here as a subject of commerce. Manufacturers must receive the benefit of commerce with all countries if they want to derive the full advantages growing out of manufacturing industries. Our tariff law is a terrible bungle as it is; you are at work in the right direction; but I commiserate you. The work is one of the most important that can be imagined, to restore uniformity to the tariff, and as far as possible to lay a foundation for foreign commerce as an outlet for American manufactures. Our house is considered the largest house in our trade, and I know that within a few years past the competition in the distribution of merchandise has been such that very little money has been made. Every merchant will tell you that, because we have overdone—we have imported too much. The same thing is sure to follow in other manufactures. The American people are so active and energetic that they are bound to overdo the business of manufacturing if you will only give them a chance. Then we must have an outlet abroad where a portion of our surplus products can be sent. We are fusing in this country the identical elements from which the English race have sprung—the Teuton and the Celt—and we are bound to be a commercial people; it is in our bone, blood, and descent, and we have got to have foreign commerce; and the proper work of this Commission is to look carefully after the manufactures of the country, and restore, as far as possible, an outlet for the surplus in manufactures that is sure to arise in the future.

The following is the alphabetical list referred to in Mr. Robbins's statement:

Article.	Present duty.	Proposed duty.	Reduction in revenue.	Remarks.
Asafotida	20 per cent	Free	\$3, 208	A crude substance, and produced only in the East Indies.
Asphaltum	25 per cent	do	23, 853	A crude substance, and important in manufacturing.
Beeswax	20 per cent	do	283	A crude substance, and mainly exported to Catholic states for church candles.
Berries, n. o. p. f.	10 per cent	do		A crude substance, and all the principal berries are now free.
Drugs, crude, n. o. p. f. ..	20 per cent	do	20, 000	A crude substance; all drugs are crudes, and only crudes are drugs.
Emery ore	\$8 per ton	do	17, 305	A crude substance, and used in manufacturing.
Gum, resins, and rosin, n. o. p. f.	20 per cent	do	25	A crude substance.
Oils—				
Bay leaves or bay rum, essence or oil.	50 cents per ounce	do	1, 348	A crude substance, and used in manufacturing, and produced only in the West Indies.

Article.	Present duty.	Proposed duty.	Reduction in revenue.	Remarks.				
Castor	\$1 per gallon	Free	\$1,463	A crude substance; sells freely at \$1 per gallon.				
Cotton-seed	30 cents per gallon	do	0	A crude substance, and largely exported.				
Croton	\$1 per pound	do	2,542	A crude substance; used in medicine only.				
Essential, all, n. o. p. f.	50 per cent	do	46,077	A crude substance, and a cause of much dispute.				
Expressed, all, n. o. p. f.	20 per cent	do	33,177	A crude substance; the French tariff classes all oils as crude substances.				
Flax or linseed	30 cents per gallon	Free or 10 cts. per gallon.	2,905	A crude substance; an important article in manufactures, and should be free or not over 10 cents per gallon.				
Hemp and rapeseed	23 cents per gallon	Free	2,442	A crude substance.				
Laurel or bay, fixed or expressed.	20 cents per pound	do	250	A crude substance; used only in medicine.				
Lemon and orange	50 cents per pound	do	44,210	A crude substance; used in manufacturing.				
Mustard, expressed	25 cents per gallon	do		A crude substance.				
Olive, not salad	do	do	43,007	A crude substance, and a cause of much dispute.				
Olive and salad, in flasks or bottles.	\$1 per gallon	do	216,788					
Whale, seal, fish, neats-foot, and all animal.	20 per cent	do	5,304	A crude substance, or natural product.				
Seeds—								
Hemp and rapeseed	½ cent per pound	do	9,500	A crude substance.				
Castor, or castor beans.	60 cents per bushel	do	21,924	A crude substance, and used in manufacturing.				
Flax or linseed	20 cents per bushel	do	150,582	Do.				
Sponges	20 per cent	do	45,858	A crude substance; the sponge trade is chiefly in the hands of Hebrews, and is very largely undervalued at the custom-house.				
Tar, crude	do	do	205	A crude substance, and largely exported.				
Acetate—								
Of ammonia	25 cents per pound.	20 per cent		Chemicals used in medicine.				
Of baryta								
Of iron								
Of potassa								
Of soda								
Of strontia								
Of zinc	10 cents per pound	do		Chemical; used in the arts and medicine.				
Of copper								
Of lead, brown					5 cents per pound	do		Chemical; very much used in the arts.
Of lead, white					10 cents per pound	do		Do.
Of lime	25 per cent	do		Do.				
Of magnesia	50 per cent	do		Chemical; used in medicine.				
Acid—								
Citric	10 cents per pound	do		Chemical; very largely consumed.				
Tartaric	15 cents per pound	do		Do.				
Alum, all kinds	60 cents per 100 lbs.	do		Chemical; very important in manufactures.				
Antimony—								
Crude, and regulus of	10 per cent	Free		Metal of foreign production.				
Sulphuret	do	do		Crude substance.				
Argols, refined or partly refined.	6 cents per pound	10 per cent		Chemical; much used in the arts.				
Arrowroot	30 per cent	20 per cent		A medicinal food.				
Balsams for medicinal purposes.	do	do		Should be 20 per cent. to correspond with other drugs and medicines.				
Barley, pearl or hulled	\$1 per pound	Free		A medicinal food.				
Barytes, and sulphate of.	½ cent per pound	10 per cent		A mineral and chemical; much used in the arts.				
Benzoates	30 per cent	20 per cent		A chemical product; used in medicine.				
Borax, refined	10 cents per pound	10 per cent		A chemical product, and of great importance in manufactures.				
Calomel	30 per cent	20 per cent		A chemical product; used as a medicine.				
Camphor, refined	5 cents per pound	10 per cent		An important article, and 10 per cent. is sufficient protection.				
Cream tartar	10 cents per pound	20 per cent						
Fusel oil	\$2 per gallon	Free		A waste product, and everywhere extensively used in the arts.				

Article.	Present duty.	Proposed duty.	Reduction in revenue.	Remarks
Gelatine, all kinds	35 per cent	20 per cent	Gelatines and glues are synonymous terms; both should pay the same rate of duty.
Glycerine	30 per cent	do	The duty on this article should not exceed 20 per cent.; 10 per cent. is ample protection.
Iodine, resublimed	75 cents per pound.	do	Is a chemical, and used as a medicine and in the arts.
Licorice— Paste or rolls	10 cents per pound.	5 cents per lb.	} Licorice juice, paste, and rolls should pay the same duty.
Juice	5 cents per pound.	do	
Medicinal preparations ..	40 per cent	20 per cent	Should be put on the same basis as chemical preparations and salts, say a uniform rate of 20 per cent.
Paraffine	10 cents per pound.	Free	Largely exported.
Potash— Bichromide	4 cents per pound..	20 per cent	A very important chemical.
Chromate	do	do	Do.
Chlorate	3 cents per pound..	10 per cent	A very important chemical, and is not manufactured in the United States.
Iodate and iodide	75 cents per pound.	20 per cent	Are medicinal chemicals.
Prussiate, yellow	5 cents per pound..	do	Is a very important chemical in the arts.
Prussiate, red	10 cents per pound.	do	Do.
Quinine— All salts of	Free	10 per cent	} Very important medicinal chemicals, requiring at least 10 per cent. protection.
Sulphate	do	do	
Rochelle salts	5 cents per pound.	do	Is an important medicinal chemical.
Saleratus and bicarbonate soda.	1½ cents per pound.	do	Is a very important article in general use.
Soda— Carbonate sal-soda	½ cent per pound ..	do	Do.
Caustic	1½ cents per pound.	do	Is a very important article in the arts.

PETITION OF BICYCLE RIDERS.

NEW YORK, *October 6, 1882.*

The following petition in regard to the duty upon bicycles was read and ordered to be printed:

We, the undersigned, bicycle and tricycle riders of the United States, do most respectfully but earnestly petition your board to consider the expedience of materially reducing the tariff now imposed upon imported bicycles and tricycles; and for the following reasons:

1. The bicycle is demonstrated to be of practical value as a road vehicle, whether for pleasure or as a method of locomotion from point to point, and has become a fixture as an article of manufacture, commerce, and public use; while as a healthful recreation and exercise, bicycling is admitted by the medical profession to be beneficial in the highest degree.

2. The average list-price of a first-class bicycle in England is from \$75 to \$85, but by reason of imposts, transportation charges, incidental fees, and the American royalty, it costs in this country nearly half as much again.

3. American bicycles are yet in the experimental stage of construction, while English manufacturers are producing almost perfected results, and there is a great demand by experienced riders for first-class English machines at a fair price—a demand the American manufacturers cannot at present meet at any price; but the heavy tariff and freight charges, as well as the exaction of a royalty and license fee by the Pope Manufacturing Company, tends to lessen the number of importing dealers to the point of inadequacy of supply, and purchasers are put to much inconvenience, delay, and extra expense.

4. By purchase and reissue of patents, the Pope Manufacturing Company has obtained control of bicycle manufacture in this country, and exacts a royalty of \$10 upon each machine imported or manufactured by other parties. This monopoly enables the American company to put its machines on the market at a very much higher price than the same quality of machines can be purchased for in England, and prevents persons of average means purchasing as good bicycles as they would wish, and thereby keeps many from riding who would otherwise, and so checks the progress of bicycling in America.

(Signed by the users of bicycles in different sections of the country.)

L. P. OLDS.

NEW YORK, *October 6, 1882.*

The following communication from Mr. L. P. OLDS, in regard to the duty upon pineapples, was ordered to be printed:

Pineapples are the chief source of income to the planters of the Bahamas. Soil, climate, and hundreds of years of experience in raising, have combined to make these islands famous herein; and soil, climate, nor experience being favorable anywhere in the United States, prevents any competition or damage to us by extending this traffic. At first it was thought proper to include other fruits, as oranges, lemons, bananas, and even others; but as Florida seemed to be experimenting in such direction, it was decided to harmonize and compromise on the one sort, and ask for a reduction of the duty thereon. This duty is now 20 per cent. It is for your consideration whether, from the facts, 10 per cent. would not be effectual in promoting the interests of all concerned.

Pines are a delicate fruit, decaying readily; at times the year's crop realizes hardly anything. For instance, in 1875, only about \$43,000 were returned. It was loss of crop, shipment—all loss.

A hardship also is the law requiring the damage on cargo to be one-fourth, else no appraisement allowance, and then only for the excess over the one-fourth.

The soil of these islands exactly suiting this fruit, it is here perfected, outrivalling all other lands. But owing to the high duty it has been a study among the growers what to do, and the question of raising vegetables is now considered.*

Just here comes in the American side of the question: First, inasmuch as we grow vegetables very largely; 2d, the mackerel flesh (as termed), is preferred in this trade, and the trade falling within the months of April and August exactly prevents these shipowners and seamen from ruin. These vessels, say two hundred, if tied up to the dock during summer, would rot in a season. Keeping this trade intact, these two interests are conserved.

This trade, by nursing, with a fairer duty, can be enlarged to double.

Besides, as a reciprocal matter, quite a free list is given Americans. The compliment should be returned.

Again, the islands being so nigh, feel allied, and do not hesitate to say that they prefer trading with us, if possible, and maintain their present warm sympathy.

Besides the importers say any increase of this import benefits them, as they sell on commission, the cargo, and send back supplies raised or manufactured by us.

The amount of importations annually sum up about \$300,000 from the ten islands of the Bahamas engaged in pine growing.

Lately has been found in the caves here and there a phosphate peculiar and suited to the improvement of soil, which, if inducements are offered by decrease in present duty, would be immediately put upon the pine-apple lands, so as to enlarge the crop, which, it is at once seen, would increase the revenue here. At present, however, the British are shipping this guano to home truck fields, as a source of wealth. Ship-

* See consular returns from Nassau, N. P.

ping dirt 3,000 miles, instead of its being put to immediate use in growing fruits for our markets. Yet, who is to blame?

The Cuba trade being mainly in oranges and lemons need not be considered, only where pines are grown.

Perhaps the only question lessening the claims of these foreigners is that of discrimination. But as this fruit, though raised in other parts of the world, is raised in these islands in perfection, none will complain at the movement in their behalf.

I am sure Florida, which State is so progressive in producing as to merit, and receive the praise of all, need not and will not complain at any aid in the direction asked.

Your honorable body will therefore, as is believed, very much aid our own commerce, and comity between these warm-hearted neighbors and ourselves, by duly passing upon the merits of their complaint.

CHARLES H. ASHBURNER.

NEW YORK, *October 6, 1882.*

The following communication from Mr. CHARLES H. ASHBURNER, president of the Abbott Iron Company, of Baltimore, Md., in regard to iron ores, was ordered to be printed :

I have observed, with great surprise, the reported testimony of Horace L. Brooke, of this city, in relation to admission of foreign ores free of duty. Whilst he seems a protectionist on the matter of steel rails and other items which he is not connected with, he seems to ignore the matter of wages connected with the raising of ores. He says wages are very unequal on this and on the other side the water. This we admit. Ore that may cost in our money 50 cents per ton to mine there with excessively low wages, would cost here \$1.25 to \$1.50. The idea that ores cannot be raised in this country to make first-class pig iron is simply ridiculous. I know from experience there can. We are using them constantly. We are buying, all the time, first-class commercial irons, without the admixture of a pound of foreign ores, and are satisfied there are large amounts of native ores, of best quality, only awaiting development. If foreign shipments should come free of duty, and often (in vessels of foreign bottom) as ballast, our mine owners might as well close up their mines and let foreigners, whose labor would be paid for our necessities, do the whole business.

I wish to make this statement, from the fact that we are the largest iron works in this State, and that (owing to absence) we could not appear before you in Baltimore.

I think duties on foreign ores should not be less than \$1 per ton.

A. SCHWARTZ.

NEW YORK, *October 6, 1882.*

Mr. A. SCHWARTZ, of New York, manufacturer of jewelry, addressed the Commission as follows:

I have but a few words to say. I am a manufacturer of jewelry, and manufacture one particular line of goods called religious jewelry, which is imported here free of duty. I find it impossible to compete with foreign manufacturers. I have brought with me samples of my goods so that the Commission can inspect them. The only difficulty I meet with is, that on account of the high price of labor here, and other high expenses, I cannot compete with the foreign manufacturer.

By Commissioner GARLAND:

Question. What recommendation do you make; what duty do you ask to have placed on these goods?—Answer. At least 20 or 25 per cent.

By Commissioner BOTELER:

Q. This business of yours gives employment, I suppose, to persons of artistic taste in designing these articles, as well as to ordinary labor?—A. Yes, sir; there are possibly \$200,000 or \$300,000 worth of these goods imported here annually.

By Commissioner PORTER:

Q. What are these articles called?—A. They are called religious medals, and are manufactured of gold and silver. They are known as "Children of Mary medals," "Immaculate Conception," "Guardian Angel," and other medals. They are imported free of duty as religious goods.

Q. Are you manufacturing them in this country?—A. Yes, sir; the samples I have here are of my own make.

By Commissioner McMAHON:

Q. Silver and copper medals have been free of duty since the 2d of March, 1861. There has been no change in the law since then. When did you begin to manufacture these goods?—A. About six years ago.

Q. Were these goods admitted free of duty at the time you began the manufacture of them?—A. I am not positive about that. I made no inquiries. I supposed there was a duty at the time I commenced manufacturing.

GENERAL TARIFF REVISION.

METROPOLITAN INDUSTRIAL LEAGUE.

NEW YORK, *October 7, 1882.*

Mr. E. H. Ammidown (Ammidown & Lane, Woolen Manufacturers), Chairman of the Committee on Statistics of the Metropolitan Industrial League, appeared before the Commission and made the following remarks:

MR. PRESIDENT: The Metropolitan Industrial League recognized at the outset of the work of the Tariff Commission that its greatest difficulties would not come from the opposition of its enemies, but from the want of preparation, and often reluctance of the industrial classes to appear and properly present the claims of their several pursuits.

Men actively engaged in their daily work rarely have the time, if they have the habits of thought and expression, necessary to comprehend fully the relations of their own Industry to others, and to state effectively and clearly these relations, or in what way a change of laws would either serve or injure them.

The League has endeavored to remove this difficulty by ascertaining, through personal inquiries and frequent intercourse with men in different manufactures, the requirements of the various industries in this vicinity, and the changes which might be made in the Tariff for their advantage. The League has also caused to be prepared a series of forms, showing the Tariff as it is, and arranged with blank spaces for suggestions and recommendations. These forms, with circular letters explaining them, have been widely distributed, and have resulted in the collection of much valuable information. The League has been assisted in its work by Mr. Charles S. Hill, well known to you all as one of the most accomplished Statists in our country. He has for more than two months been engaged in tabulating and arranging the statements and suggestions received by the League, so as to present them to you in condensed form. It will be seen that the purpose of the League has been to gather and interpret to you the views and desires of important classes of industries, which for reasons above mentioned have not been presented to you in a more direct way by the representatives of these industries themselves. Although Mr. Hill has accomplished much, there remains still much to be done before he will be able to complete his work. Mr. Hill will now state to you personally the facts which he has thus far prepared, and the conclusions to be derived therefrom, and at an early day hereafter will lay before you the final and complete results of our labors. We ask now for his preliminary report your favorable consideration.

METROPOLITAN INDUSTRIAL LEAGUE.

NEW YORK, *October 7, 1882.*

Mr. CHARLES S. HILL, Statistician, Department of State, Washington, appeared before the Commission in behalf of the Metropolitan Industrial League and made the following

PRELIMINARY STATEMENT.

MR. PRESIDENT AND GENTLEMEN OF THE TARIFF COMMISSION:

For the first time in the history of our country an incorporated commercial and industrial association, embracing all branches of Industry, has undertaken the work of preparing and presenting for consideration a revision of our Tariff Laws and Schedules of Rates.

In behalf of the Metropolitan Industrial League I have, therefore, the honor of submitting for such consideration this work, and of stating the particulars thereof, that you may understand fully the motive and purpose that suggested the undertaking, the earnestness that has characterized the prosecution of this labor on the part of each one of its members, and that the country may learn and be assured of the sincerity that has actuated this Industrial League to come forward in a work of harmony, by first finding the equity of all interests, and then by mutual concessions accepting and presenting to your honorable body a revision of our Revenue Laws, free from individual preferences or separate interests.

This work has already produced several good results, but there could be none greater or more satisfactory than the knowledge that the labor of the League has proven that a consideration for others' interests and the prosperity of every industry is an incentive *possible* in a great business community, and stamps forever as false the assertion that the manufacturing branch of Industry is selfish and monopolizing.

It may be said that an equitable Tariff has been attempted before. It has, but by political and special interests; never before by the consolidated action of our several Industries.

And yet no other parties can frame a wise and beneficial Tariff. How could Congress be expected to make wise laws for our Industries without the united advice and co-operation thereof?

Your own experience, gentlemen, has doubtless already proven that it requires more than the opinions of individuals inexperienced or theoretical, or even than the debates in Congress, to study out and make up the frame-work of an economic law.

I do not intend to take up your time by the same fault, nor with a historical essay upon our past condition. You, as prominent publicists, are familiar with that detail, even if it were advisable to argue our present necessities upon issues that have passed forever, and are now merely historical, nor is it necessary to weigh down this statement with official statistics that are accessible to, if not possessed by you at present, for reference or corroboration.

With the understanding, after our conference of yesterday, we will send you without delay our detailed specifications of revision in law, rates, classification, &c., and reasons therefor in the form of

A DIGEST OF THE LEAGUE,*

in which you will find each "Section" and "Schedule" in the order of our present Statutes completely revised and defined; and for this work we respectfully ask your serious consideration.

The work of the League, you will recognize, has been a most delicate, if not difficult, task, and entailed as much labor, care, and time as all other interests presented to you have taken collectively.

Having begun this work in good faith and pursued it vigilantly, it is not intended to finish it carelessly or lose interest with its transfer, but to add, within a reasonable time, data of several prominent interests that have been so far omitted only from a desire to give them more careful consideration.

In regard to the law of our Tariff, its phraseology, distinctness, conciseness, and completeness, the League submits several changes, but has not been unmindful of the fact that the wording and punctuation of such a law is of the most vital importance, especially in final revision, lest the omission of a word or point mar its beneficial operation; hence the caution of the League.

Our Tariff has been much abused, but it is far from being the worst extant.

Within the last five years I have collated the Tariff of every country, and have analyzed each and compared the same with our own.

There is far more ambiguity in almost every other Tariff than in our own; even the short British Tariff is susceptible of misunderstanding, and the litigations thereupon are not infrequent. Perhaps it is not possible for fallible man to frame an infallible Tariff, but without the aid, advice, and consent of all Industries it is certainly impossible. We have advanced to the head of all the nations of the world in Wealth in the last decade under our protective policy, and although imperfect in many points of detail, which you, gentlemen, are now endeavoring to find and correct, our Tariff has nevertheless proven to be based upon a wise system that conduces to the prosperity of the Agriculturist as well as the Manufacturer, the Miner as well as the Banker, the Tradesman as well as the Shipper.

It has been asserted that the World is moving toward Free Trade. It is the reverse. England stands alone; not even will her colonies follow her. Look at the present standing of all Nations. It will be seen that the principal nations declare at present—

For Protection.—Argentine Republic, Austria-Hungary, Belgium, Chili, China, Canada, Denmark, France, Germany, Guatemala, Japan, Mexico, Norway, Portugal, Russia, Spain, Sweden, Switzerland, United States. Of the smaller nations, Turkey, Greece, and even the Australasian Colonies have protective Tariffs.

For so-called Free Trade.—Great Britain and the Netherlands.

The Tariff of the Netherlands ranges from 5 to 20 per cent. ad valorem; and slightly specific, but she is purely a commission Nation. The following table exhibits comparatively these conditions.

* For Digest referred to see pages 1711-1763.

Epitome of the Tariff rates of the Principal Nations upon the Chief Industries of the United States.

[From advance sheets of the "Tariffs of the World and Analyses Thereof." D. Appleton & Co.]

[By Charles S. Hill.]

Articles.	United States.	United Kingdom.	Germany.	France.	The Netherlands.	Belgium.	Italy.	Spain.	Russia.	Austria. ¹

¹ Austria has just increased her tariff 50 per cent., following example of Germany and France.

² The unit of quantity in the United States tariffs upon these articles is square yards, &c., and also of duplex system, unlike any other nation; it is therefore impossible to equal their quantity to hundred-weight or to kilograms. The average ad valorem rate is given as the best comparison possible.

³ The British Iron and Steel Association, in a publication, represent the United States higher in tariff rate than other countries. Such is incorrect and unfair in general average and in general conditions, even when considered upon basis of conventional rates of "favored nations."

It will be seen that, with the exception of Great Britain and The Netherlands, non-producing countries, the ratio is as follows:

Sugars: The United States is lowest; Austria highest—protecting the Beet-Root Industry.

Woolens: Belgium is lowest; Russia highest—reviving manufacturing Industries, with vigor.

Iron and steel: France is lowest; the United States next lowest; Russia highest.

Silk: Belgium is lowest; Russia highest.

Cotton: The United States about the lowest; Italy highest.

Flax, Linens, &c.: Belgium about the lowest; Italy highest.

Tobacco: Belgium is lowest; *Great Britain is highest* (excepting the prohibitive countries).

Spain modified her rates slightly July 6 last.

The products of the Dutch Colonies, viz. Sugar and Tobacco, are protected by *specific rates* in the Netherlands.

By a freak of nature the Iron deposit leaps from Great Britain to Spain, hence the difference in the rates of intermediate countries.

REFUNDING.

The League asks the attention of the Commission particularly to several documents of the Treasury Department for past years, entitled

"CUSTOMS DUTIES REFUNDED,"

a statement of the various sums paid back to merchants as excess of duty, error in liquidation, &c.

Last year the amount, as will be seen by the accompanying document, was \$800,000, but some years it runs up as high as \$5,000,000.

This requirement of our business community to lock up more or less of their capital from complexity or ambiguity of the wording of our Tariff Law or specification under the several paragraphs of the schedules seems unnecessary, if not inexcusable.

If the blame lies entirely in the law there is all the more need for immediate remedy, and upon this point the League has prepared evidence.*

ENUMERATION.

There is a conspicuous fault in our Tariff enumeration of articles under the several Schedules, and especially in the Entry List of the published Customs returns of the Treasury Department.

Although some articles are small and apparently insignificant, their non-enumeration is the source of fraud and injustice.

The conglomerate entry of all small articles without regard to their importance enables a dishonest importer to invoice his goods in a different form and obtain their entry either by the Free List or at undervaluation. The articles provided for will be seen by the form herewith submitted of the Customs House, viz, Classification of Imports, &c., while very many others are hidden forever from investigation, unless by hunting up old Invoices—which is difficult.

To this matter, in detail, the League has also evidence to present in proper form.*

And here reference might also be made to the publication officially of the values of enumerated articles before instead of after liquidation; hence the certainty of a wrong estimate in averaging.

CLASSIFICATION.

Under this head there are probably more faults to be picked out and remedied than under any other.

It is the cause of much misunderstanding and many law-suits that classes specified may be and are susceptible of being confounded with similar articles, or the same articles or material in different form or character.

CONDITIONS AFFECTING RESULTS OF TARIFF LAWS.

The Industrial League has not simply considered the Tariff upon its superficial appearances. We have and are still searching into those most influential relations that affect a nation's Tariff, viz:

Labor,	Commission,
Interest,	Freight,
Material,	Measurement,
Supplies,	Insurance,
Value of Investment,	Taxation,

Exchange,

by a series of forms to obtain and to prove these conditions.

* See Appendix.

The completion of this study cannot, of course, cease here, but will be continued as rapidly as possible with care and accuracy, so that the information derived may be of lasting benefit to the theorist as well as the statist and thinking merchant, while helping the laborer to the consideration due him in the estimation of the world.

INACCURACY OF CUSTOMS RETURNS.

In many instances where "overcharge" is made, the published Returns are taken before Liquidation, which causes wrong averaging and misrepresentation of the true average rate of duty paid.*

LABOR.

Neither the condition nor the influence of the laborer can be understood without considering the cost of his food and clothing, and his feeling of pride and manliness in different countries. This is too extensive and important a subject to detail here,† but which I have endeavored to illustrate in diagrams to aid in calling attention to the true conditions of this important point, and have substantiated the drawing with official references.

The valuable work published by the Department of State (Labor in Europe) is the only complete work based upon authoritative data of recent date that will show these relations; and indeed this work is now rather too old for reference upon points and conditions of to-day.

The secret of British advantage in Industry is really rate of Interest; also illustrated on page 1688.

In pursuing this work the League has ascertained facts that have certainly never before been demonstrated, if generally known.

It is intended to prove that†—

1st. In almost every record of history where free importation has been permitted, the article has risen in price and never produced the expected result.

2d. In cases where a Tariff rate has been given to crude material, the latter has fallen in price, even in so small an article as china clay, &c., thereby benefiting the owner of our soil and the manufacturer of the product alike.

3d. That labor does consume all profits, at present, in many Industries, and the unreasonableness of expecting or asking a manufacturer to give up his business and desert his invested capital—in some instances amounting to half a million dollars—because the last few years of losses or burdens defer that hope yearly indulged of recovery and final success.

It is asked again of your honorable body and expected by the Industrial League, that their suggestions may receive your consideration; and they look with great hope to a most successful result of your trying labors, and trust that the future may record for you in this great work the earnest appreciation of your grateful countrymen.

* Example. Paragraph 119.

Customs Rate, 14 lbs., value \$7.00 = 50 cts. per lb.
Duty, .09 cts. and 10 ad val. = \$1.96, or 28 %.

The true value could not run over 20 cts. per lb., and should be returned:

True Rate, 14 lbs., value \$2.80 = 20 cts. per lb.
Duty, .09 cts. and 10 ad val. = \$1.54, or 55 %.

In so small an amount this discrepancy makes but little difference, but when the sum is \$10,000 the importance is greatly magnified.

So also many other paragraphs.

† See pages 1700, 1701, and Appendix.

METROPOLITAN INDUSTRIAL LEAGUE.

NEW YORK, *October 20, 1882.*

Mr. CHARLES S. HILL, Statistician, Department of State, Washington, appeared before the Commission on behalf of the Metropolitan Industrial League, and made the following

GENERAL STATEMENT.

MR. PRESIDENT AND GENTLEMEN OF THE TARIFF COMMISSION: The Metropolitan Industrial League has now the pleasure of submitting to your honorable body their work in the revision of the Tariff Laws and Schedules of Rates of our country.

In presenting this work, now complete, and covering as it does every Section and Paragraph of that Law, after careful though hurried consideration and preparation, it is proper to accompany the Digest now presented* with an argument in behalf thereof explaining the reasons that have influenced these conclusions and expressing to you those reflections and considerations of the existing conditions affecting the working and the results of such a Law, that have been weighed thoughtfully in connection with and as influencing the several Industries of the United States.

Such a Law is unquestionably a politico-economic law, and therefore should be based upon three considerations:

1. The development of our Industries.
2. The necessity of our National Revenue.
3. The influences of our International Relations.

THE DEVELOPMENT OF OUR INDUSTRIES.

Under our Tariff Law, which comprises at present 24 Sections of the Revised Statutes, we have thirteen Schedules and a Free List, embracing 891 Paragraphs; 356, or exactly two-fifths, of which are under the said Free List, which contrasts greatly with the Tariffs of other nations, and, with the exception of Great Britain, approaches more nearly a real *free trade* policy than any other nation in the world.

The Sections are, in a great measure, the restructure of time-honored laws that emanated from the far-sighted judgment of our ancestors of a century ago, and which have been revised and revised; interpolated and abbreviated as our conditions have changed, our resources developed, and our Industries multiplied, until these laws are in some respect superfluous, in other respects insufficient, and in many instances susceptible of misapprehension and misapplication from the want of distinctness and simplicity. These Paragraphs were intended to enumerate every article that enters into our several Industries, but are as conspicuously deficient in adaptability to our conditions to-day as they are incomplete in enumeration. That many of these Paragraphs should be transposed to schedules where the articles more properly belong, is evident to all, and such readjustment, and especially correction of the enumeration of similar—in some instances the same—articles under two Schedules, should be one of the chief features of a revision, and in this respect some suggestions are respectfully submitted in the following pages.

To show the exact relation of our Tariff to our Industries and of our Industries to our Revenue, it is necessary to point out separately the amount of duty paid and the average rate of same paid at present, by

* Pages 1711-1763.

each of those Industries, proportionately to the total amount of Revenue derived therefrom.

Present condition of our Tariff considered by Schedules.

Schedule—	Industry.	Yield of Revenue.	Percentage or Total Valuation.
A	Cotton Goods	\$10,825,000	<i>Per cent.</i> 39
B	Earths and Earthenwares	5,230,000	43
C	Hemp, Jute, and Flax Goods	9,240,000	27
D	Liquors	6,812,000	71
E	Metals	27,385,000	29
F	Provisions	3,247,000	34
G	Sugars (Molasses, &c)	47,077,000	54
H	Silks, and Silk Goods	18,550,000	59
I	Spices	1,095,000	50
J	Tobacco	4,655,000	72
K	Wood	1,530,000	21
L	Wool and Woolen Goods	27,280,000	60
M	Sundries	29,705,000	35
Total of the thirteen Schedules of Industries in Duties paid		103,501,000	44

It will be seen that the two Industries contributing the highest average percentage of duties are Tobacco and Liquors.*

Here is presented a singular analogy, viz, a protective system of the United States and a free-trade system of Great Britain, both exacting from two like Industries of luxury, a higher rate of duty than from any other Industry or article of import.

All other Schedules fall so close on an average ad valorem rate of duty to 50 per cent., which, strange to say, has been declared the acceptable maximum rate of those who have thought that our Tariff was outrageously above that average rate, that there is really more abuse than necessary, and more moderation in our Tariff assessments than seems to be generally supposed.

And so unanimous has been the willingness and desire evinced by manufacturers and merchants whose interests demand an expression bearing upon our industrial prosperity, to concede all that is possible, to spare from the protective rates of our developed Industries, and to transfer that assessment of protection proportionately to those Industries more needy of assistance from foreign competition, that the accomplishment of the great work of bringing two extreme advocates together is not difficult, except where the purpose is based upon political motive.

To frame a wise law, is it not first necessary to consider the area of our land, the resources it possesses, and the development thereof, compared with like conditions of our international competitors in the great industrial battle of the World?

We have a territory of 3,600,000 square miles, every acre of which, except our isolated Alaska, is richly productive and varied in Agriculture; with possessions in mineralogical and all geological material of the earth; with a population of industrial laborers and inventive geniuses not surpassed, if equaled, in the world in intelligence and enterprise, and only outnumbered by those of remote and interior Asiatic countries, whose undisciplined minds and unrestrained impulses, politically and industrially, have disregarded economic guidance: Can we therefore with wisdom liken our own laws unto those governing a country of 120,000 square miles, of limited resources, one-half of which is owned by about 2,000 landholders, viz, Great Britain?

Is it not the duty of your honorable Commission to study first these conditions and the possibilities of their development before attempting

* Sugar contributes, however, as will be seen, the highest amount in volume.

to frame an economic law to govern our great country of unlimited resources and cosmopolite people?

Of our *unlimited resources*—the products of the earth—there is but one judgment at home and abroad.

It would be idle to give you a home picture, except one taken from a foreign standpoint, that we may see ourselves as others see us, not personal or theoretical, but official.

A Report of the Royal Commission on Agriculture has just been published, which shows very forcibly the influence of our resources upon the limited area and non-producing lands of Great Britain.

The report is made

TO HIS GRACE THE DUKE OF RICHMOND AND GORDON, PRESIDENT:

MY LORD DUKE: Since Messrs. Read and Pell reported upon the aspect of American agriculture just two years ago, there have been such changes that it will be necessary for me in this report to go over much of the same ground as they did. * * *

Men living in this country, and more especially those farming in it, have seen within the last two years a great increase in the value of land, equal at least to 20 per cent., in the Middle and Western States. In some portions of the West it has been over 100 per cent.

Three years ago, west of the Mississippi, it was impossible to sell western lands at any price. Now they are readily taken up at prices varying from three to six dollars per acre. It is almost impossible to say positively what has been the rise. * * *

During those years of depression, from 1873 to 1878, a silent revolution had been going on. In the East, where the times were exceedingly hard, and more especially in the manufacturing districts, whose prosperity was partly owing to protection [? how times could be hard while prosperity was enjoyed is not explained], there had been a gradual movement of people to the West. It went on almost unseen, this grand emigration. If it had been in Ireland or among the Scotch crofters the population would have held on with iron tenacity to their poverty, but the adaptability of the American mind solved the problem in an easier, less bloody, and more beneficial manner.

For four years the granaries of America ran over with grain produced at a cheap rate, on cheap land with cheap labor. * * * Wheat poured into Great Britain at an alarming rate, * * * and perchance if the uneducated ago of the British agriculturist had seen the full extent of the country on which the vast plethora of beef and bread was raised he would have given up the last thread that bound his hopes together.

Such is the impression of a Commission sent to consider our conditions this year, given in a voluminous and important paper.

But here, is it not pertinent to ask whether a country will be developed by Agriculture alone?

Would our West have developed more rapidly than did our South previous to the war had not the mechanic followed the farmer, or would our new South to-day be alive with Industry that enchances and diffuses her wealth but for Manufacture?

Another English umpire, Sir Edward Sullivan, says:

The Western and Southern farmers find that the protected manufacturers, instead of being their enemies, are their best customers; they are attracting them to their region by every means in their power; the more prosperous they are, the more money they have to spend, the more good they do them. Chicago, the capital of agricultural America, is rapidly becoming one of the largest manufacturing cities in the Union.

He might have added Atlanta as her competitor.

Of our *cosmopolite people* there is much always to be said, but here only one thought.

For the year ending June 30, 1882, the number of immigrants to our country was 788,992, coming from the various parts of the world, but especially from the several nationalities of Europe, viz:

Continent.	Males.	Females.	Total.
Europe	400,247	246,517	646,764
Asia	30,604	125	30,729
Africa	24	8	32
America	57,202	42,801	100,003
Islands of the Atlantic, n. s.	868	522	1,488
Islands of the Pacific	747	142	889
All other countries and islands ..	64	63	127

So great has been this exodus from Germany that the Department of State was recently informed in a "Consular Report" as follows:

This unprecedented exodus is engaging the serious attention of the German economists, and especially that of Imperial Chancellor Bismarck. The former have been calculating the working value of the average emigrant, and state that the services of every laboring man leaving the country may be valued at \$1,000; there can be but little doubt that every emigrant is worth that yearly amount to the United States. Computing the wealth the United States acquire by the influx of population on this basis, and estimating the number of emigrants to the United States during the year of 1881 as having reached 600,000, the country would have gained in that period \$600,000,000.

As this loss of wealth to Germany appears so reliable, it is clear that the increase *this year* of our industrial wealth from Immigration has been about \$800,000,000.

But to estimate carefully as to the actual money brought into our country per immigrant, we must first take the average number of adults to estimate the amount of specie added by this yearly increase of population.

Another United States Consul in Germany says, in reference to this point:

The following are the figures given me by the police authorities of this port: Adults, 9,223; children under-twelve years, 2,208; infants under one year, 519; total, 11,960.

This is a very fair proportion; or take even less, say, 75 per cent. only as adults, we have this year, adults..... 590,000
at a minimum amount per capita of \$100

adding to our country a specie value of.....\$59,000,000

But taking this year's immigration as a settled part of our people at the usual average of 5 per family, and with the minimum family expenses per month \$50, and \$600 per year, we have an *annual* increased amount expended of about \$500,000,000, besides a dissemination of old and new ideas.

Immigration is, indeed, wealth; it is a concentration of capital, muscle, and brain power to our Industries, and a loss to the country from whence it flows.

Assistant Commissioner Clay adds the following appeal to the Royal Commission of England:

How are their places to be filled? By whom is the land to be cultivated? * * * I appeal to the honorable members of the Commission as a British subject, as an Anglo-American farmer, and as one deeply interested in the welfare of Great Britain, one who wishes to see her institutions reformed, not pulled down, to suggest some idea to the legislators of our country to stay this tide of emigration, to make the people contented at home, and to raise her agriculture to a pinnacle not yet reached in the history of husbandry.

It is no false feeling or jealousy of the American people, it is the welfare of thousands and thousands of British subjects that you must protect. British agriculture is wasting under some terrible disease, whose direful effects are intensified by disastrous seasons.

Providence will provide a cure for the latter, but the former must be seen to by the representatives of the farmers and our legislators, and the Commission is placed in a position to do much that is good, and to it the eyes of the British farmers are turned. Let us take a lesson from the past. France drove the Huguenots from her shores, and her loss was England's gain, a gain that has planted in her cities vast industries which have made her glorious and great.

This is what others think of us. Now, let us think for ourselves.

• OUR CONDITIONS COMPARED.

To start, then, at the beginning, we must compare our country with the other principal nations of the world in these natural conditions and resources.

THE NATURAL CONDITIONS OF THE PRINCIPAL NATIONS OF THE WORLD.

Natural conditions.	The United States.	Great Britain.	France.	Germany.	Russia.	Austria.
Area	3,604,000 square miles.	121,000 square miles.	205,000 square miles.	212,000 square miles.	8,139,000 square miles.	241,000 square miles.
Population	50,152,000.	34,505,000.	37,166,000.	45,367,000.	82,409,000.	39,175,000.
Age	100 years of Industry.	800 years.	1,100 years.	1,100 years.	350 years.	1,100 years.
Climate	Latitude, 24°-49°; long., 66°-121° W.	Latitude, 49°-58°; long., 1° E.-6° W.	Latitude, 42°-57°; long., 8° E.-4° W.	Latitude, 49°-55°; long., 6°-22° E.	Latitude, 38°-78°; long., 17°-169°.	Latitude, 42°-57°; long., 12°-2° E.
Soil	Richly productive	Poorly productive	Amplly productive	Moderately productive	Partly rich and largely sterile	Moderately productive.
	Varied and abundant	Rich in coal and iron	Scanty	Moderately distributed	Medium	Comparatively scanty.

500,000 square miles to the square. 1 10,000,000 people to the square. : 100 years of Industry to the square.

NOTES.—The Industrial Age of the United States is, of course, dated from our Declaration of Independence. Industry before that period was handicapped.

The Industrial Age of Great Britain is dated from William the Conqueror, of Normandy, when the Industry of England began, although, in fact, many of the Manufacturing Industries were introduced into Britain by the Romans. Ure, Brande and McCullough—British industrial authorities—cite with pride the Iron mills of Gloucester, Kent, and Sussexshire before the tenth century.

The Industrial Age of France, Germany, and Austria are each dated from Charlemagne, who established Industry in these three countries.

The Industrial Age of Russia is taken from Peter the Great, who created Industry during his reign out of chaotic elements.

Here will be seen the advantages and the disadvantages of each nation, compared in the outstart, to learn upon what grounds we must base the framework of a beneficial economic law.

A country of 100 years competing in this international struggle of Industry with nations of 800 and 1,100 years, and having taken the lead in this short period in productiveness, in wealth, and in general results!! (See the following Diagrams.)

Is it not, then, truly said that our Industries are in their "infancy"?

Great Britain threw over and around her industrial progenies a most pronounced protective law not only until 1844, but, as will be seen in many of her manufacturing branches, until 1859,* or for 859 years, until she had monopolized the Manufacturing Industry of the world. By imitating that successful policy of Great Britain, and by hard industry in the development of these natural resources of our country, we have rapidly overtaken and surpassed even her; but Professor Sumner—the occupant of the Politico-Economic Chair in one of our most prominent Educational Institutions—argued before you last Saturday that such policy of ours was unwise and all wrong.

Official statistics are not theoretical, but data from which our real condition and political economy can only be learned—from which true principles of political economy should be drawn. And yet, Professor Sumner has not cited a fact! He has argued against theory—but with theory. What *one* fact did he substantiate? Contrast the true logic and practical judgment of the British statesman, Sir Edward Sullivan, written last year:

Thirty years ago England had almost a monopoly of the manufacturing industries of the world; she produced every thing in excess of her consumption; other nations comparatively nothing. The world was obliged to buy from her, because it could not buy anywhere else. The discoveries of gold and steam immensely increased the demands and the purchasing power of the world, and consequently the demand for the products of England. Her wealth increased by leaps and bounds that were bewildering; she was intoxicated with success; with her immense accumulated wealth, her machinery, her coal, her iron, her insular position, she thought herself unassailable; she laughed at the possibility of foreign competition; she offered to fight the rest of the world with her right hand tied behind her back; she said to the world, "I will receive any thing you can send me without duty," adding at the same time an expression of hope that they would in turn receive her goods. But they said, "No, we gladly avail ourselves of your kind offer of admitting our goods; certainly we will send you all we possibly can. At present, unfortunately, we have nothing to send; we cannot yet supply our own wants, but when we have more capital and your machinery and workmen, we hope to have a large surplus to send you." Well, that was thirty years ago. Now, *France and America and Belgium have got our machinery and our workmen and ample capital*, and they are sending us a yearly increasing surplus that is driving our own goods out of our own markets, and every year they are more completely closing their markets to our goods.

Great Britain's statesmen had wisely recognized the threefold value of the earth's products when manufactured into shape, more useful, and contributing also threefold to the development of civilization, in employment, in convenience, and in comfort.

France, Germany, Russia, Austria, and every other country, save Great Britain, still protect their Industries in a degree, according to the nature thereof. Let him, then, who attempts to ridicule the fact, or the application of the significant and truthful term "infant Industries" of our country, be recognized as one unmindful and inconsiderate, and hence an unwise adviser in the industrial and commercial relations of our country.

Look at our developed conditions by our past economic policy.

* See Appendix.

In the value of land we see the United States now surpasses even France; but it is production and consumption that we must consider particularly, estimating the world from a commercial standpoint.

PRODUCTION.

The value of the Live Stock of the world is about.... \$5, 000, 000, 000
Of which the United States produces 1, 800, 000, 000

Or over 33 per cent. of the Live Stock of the world.

The annual value of the Grain product of all countries
is about 5, 600, 000, 000

Of which the United States produces* 2, 100, 000, 000

Or about 33 per cent. of the Grain of the World.

Of the conditions of these two great products the Agricultural Industry of this country should indeed be proud.

It stands conspicuous as the greatest in yield and in value of the World.

CONSUMPTION.

The amount of slaughtered Meat consumed annually in
the World is about..... \$3, 600, 000, 000

Of which the United States consumes 950, 000, 000

Or about 28 per cent. of the consumption of all nations.

The value of Grain consumed annually throughout the
World is \$4, 800, 000, 000

Of which the United States consumes 1, 600, 000, 000

Or 33½ per cent. of the World's consumption, and still leaving a vast supply for those nations that fall short in production.

Thus it is evident that our people are the best off in feeding themselves of all the peoples of the World.

Look further at the present condition of Labor in our country and keep strictly to facts, ignoring theory.

AMERICAN VS. EUROPEAN LABOR.

Unquestionably Professor Sumner was right in saying that there had been, in the discussions before your Commission, "a constant reiteration of false doctrines of *theoretical* political economy," and that he "therefore deemed it right for him, as a professional student of political economy, to appear before the Commission and set forth the true relation between protective taxes and wages," yet he is unable to substantiate in any way the theory he presents.

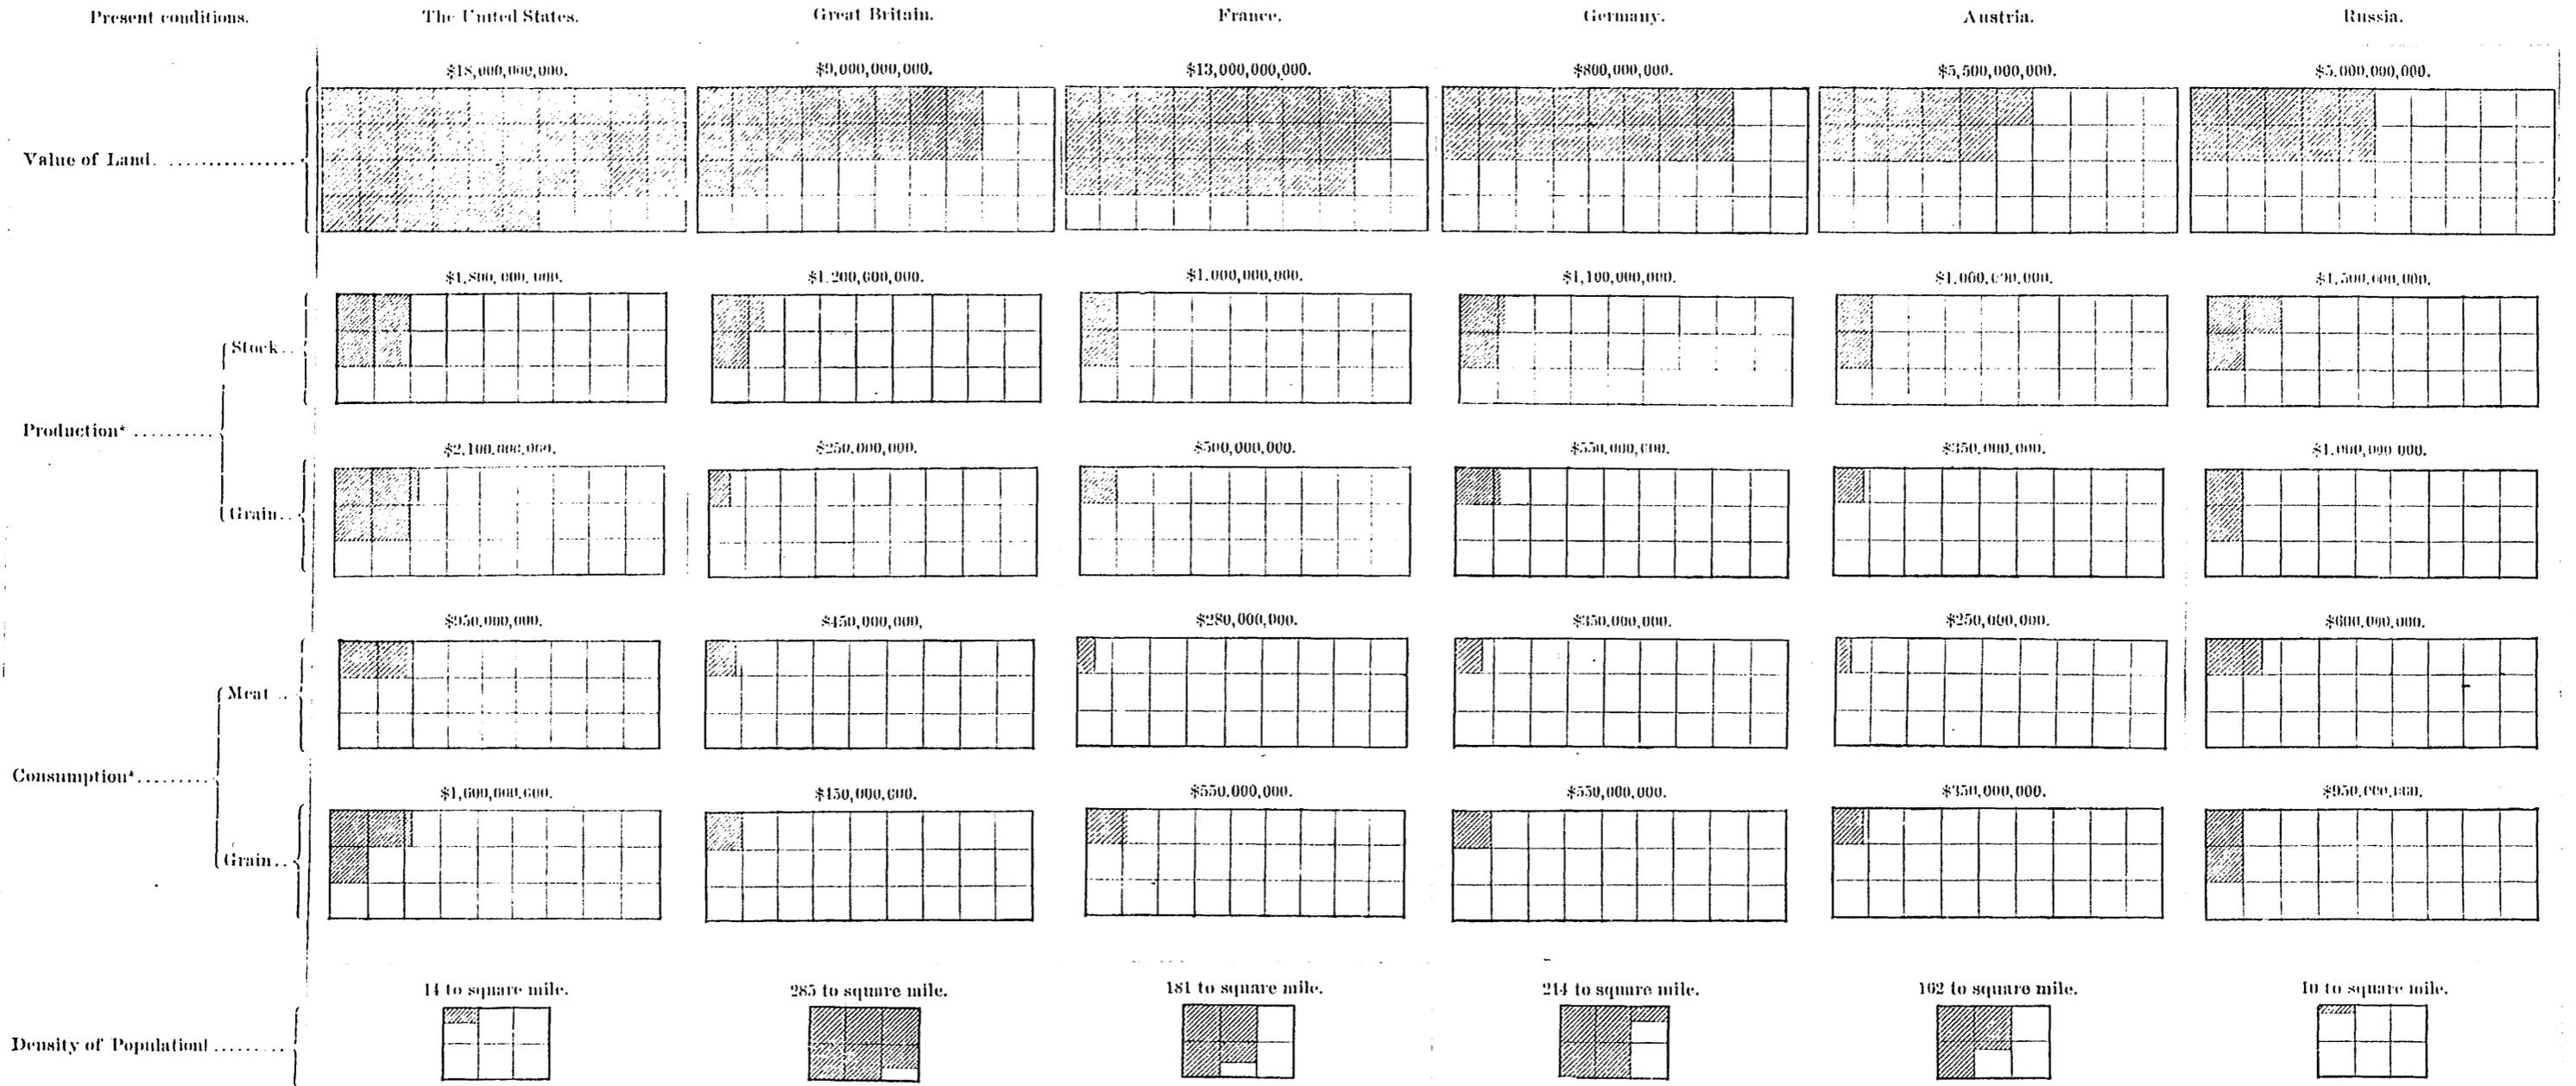

Professor Sumner, or any other responsible authority, is challenged to refute the correctness of the following diagrams, as the data upon which they are based is authentic, and the proofs have been officially published, and should be in every college library. (See p. 35, Labor Report.)

1. The rates of wages in the United States, roughly estimated, are more than twice those in Belgium; three times those in Denmark, France and Germany; once and a half those in England and Scotland; and more than three times those in Italy and Spain.

2. The prices of the necessaries of life are lower in the United States than in any of the foregoing countries; that is, the laboring people of Europe cannot purchase the necessaries of life, which are common to the American working people, as low as the same can be purchased in the United States; or, *vice versa*, if the working people of the United States lived on the same quality of food, or comparatively the same, and exercised the same frugality as the working people of Europe, they could live as cheaply as the working people of any country in Europe.

* These figures are based upon the returns of the Agricultural Department and embrace more items than given in abstract of the Treasury Department.

THE DEVELOPED CONDITIONS OF THE PRINCIPAL NATIONS OF THE WORLD UNDER THEIR SEVERAL ECONOMIC SYSTEMS.

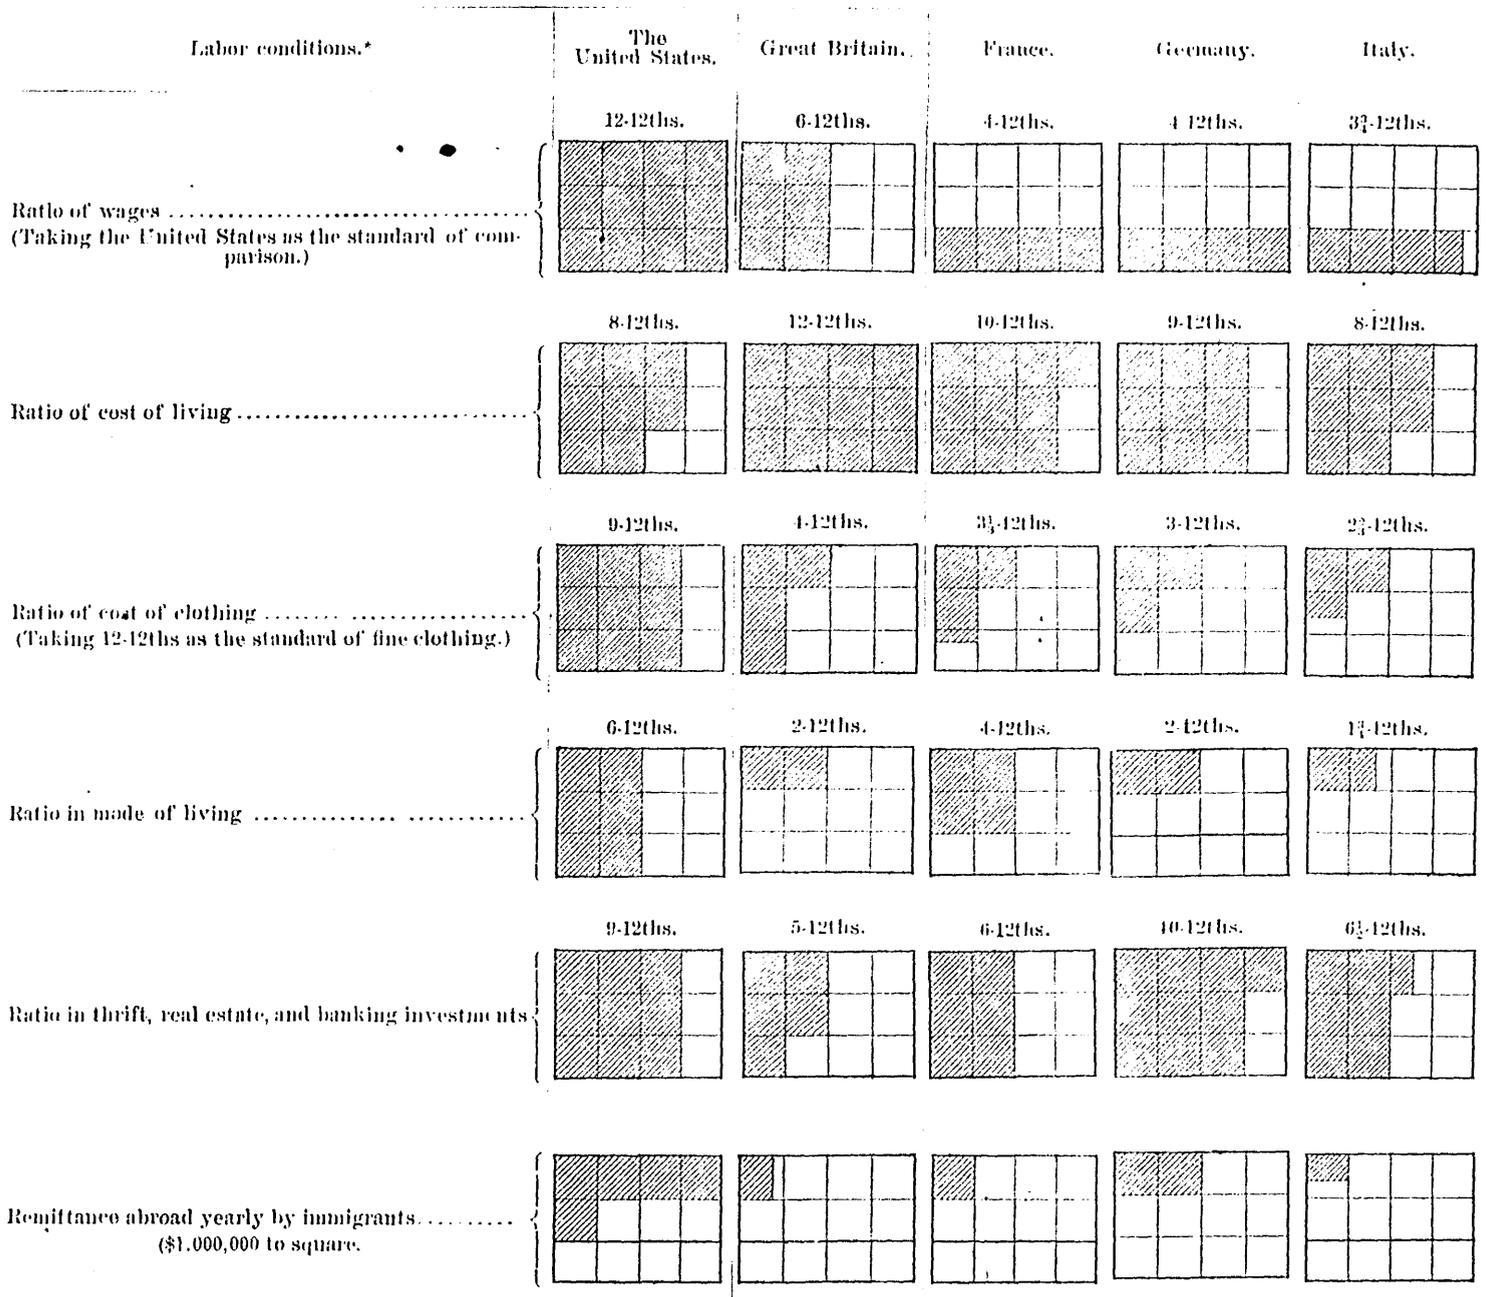

* \$500,000,000 to the square.

† 50 persons to the square.

* The meager data upon these two important economic points are so conflicting that these illustrations may evoke criticism, but the authority upon which this is based is more reliable than the statements published heretofore.

It will be seen that we consume:—double the quantity of Meat of Great Britain, and three times that of France, Germany, &c.; three times as much Grain as Great Britain, and more than double that of France; and still have a surplus for export to other nations.

CONDITIONS OF LABOR AND LIVING AFFECTING THE RESULTS OF THE TARIFF.

* These ratios represent the working population and are based, as far as possible, upon the investigations of the Metropolitan Industrial League—although not yet complete—and particularly upon Consular Reports (especially that on the "State of Labor in Europe" and "Cotton and Woolen Mills") of the Department of State.

It will be observed that, while the cost of living is proven to be cheaper in our country, the Laborer spends more because of a better mode of living; he also saves more, with exception of the Germans than the laborer of any other nation.

In confirmation of the foregoing illustrations, there could be no better authority to quote than the work of Ex-Secretary Evarts upon "Labor"—the present standard authority on this subject—from which the following is taken, page 15 thereof:

The English rates are more apparent than real, and that, while nominally the English workingman appears to receive a comparatively high rate of wages, he only works on half or two-thirds time, thus gratifying his desire to preserve a high rate of wages at the expense of time; a sentimental fiction which is neither profitable nor substantial.

Here is the explanation of the sophistry which is continually presented in argument that the English workingman is becoming better off than the American workingman by receiving higher wages.

And further in regard to wages:

It will be seen that while the wages of New York and Chicago are about twice the average wages throughout England, the prices of the necessaries of life are lower in those two cities than the average prices throughout England.

And also as to living:

In regard to the question of food-prices in England and in the United States no stronger argument can be advanced to dissipate the idea that workingmen can live cheaper in that country than in this than the fact that Great Britain imported from the United States during a recent year "necessaries of life" to the following amounts: Wheat, \$50,000,000; Indian corn, \$43,000,000; bacon and hams, \$34,500,000; cheese, \$10,300,000; flour, \$8,300,000; lard, \$6,800,000; pork, salted, \$3,000,000; butter, \$2,570,000; fresh beef, \$2,000,000; refined sugar, \$1,650,000; pease, \$1,500,000; canned and preserved meats, \$1,400,000; fruits, raw, \$1,243,000; molasses, \$653,000; coffee \$516,000; oats, \$343,000; barley, \$264,000—a total food-supply of over \$171,000,000.

Nothing can possibly more fully or more clearly exhibit the conditions of Labor under the economic system of Great Britain and under that of the United States. There is, however, another point so frequently and incorrectly set forth in argument and in essay, viz, that the English workingman is returning home, "finding by experience that he is better off there than here."

No greater harm or malice could possibly be exercised toward the laborer than to make such wild representations to a credulous mind.

It has, however, been asked before this Commission, "Is it true or false that American workmen went to Scotland, glad to be employed on the Clyde, and to receive the much-derided pauper wages?" The facts that started this idea *two years* ago were then so fully exposed that it is surprising it should still be entertained.

Mr. Evarts, in the same valuable work above quoted, disposes of this fallacy as follows (page 17):

It is well that your attention should be specially drawn to the erroneous opinions which have more or less prevailed, especially in the minds of our working people, in the United States for the past few years, that wages were higher and the cost of living less in England than in this country.

At a time of unusual depression in all trades in the United States strikes of certain trades occurred in England. Some British manufacturers, taking advantage of the occasion, induced a number of workmen from this side to go over and take the places of the English workmen on strike. This gave rise to the idea that work was more easily obtained and that wages were higher in that country than in the United States.

It may be remarked that the principal portion of those workmen were natives of Great Britain, many of them immigrants newly arrived in the United States, and all of them out of employment. The few Americans who did go were repaid for their venture by much humiliation and suffering, as the many reports from our consuls in England have testified; so that there is scarcely any need to refute the foregoing fallacy by any further consular testimony; but the Consul at Bristol puts the question in so graphic a manner, that I cannot refrain from quoting his words:

"No laborer should allow himself to be enticed, by imagining that he could better his condition by leaving the United States to return to his native country, if born in Europe. A number of such laborers and also some mechanics have, during the last two years, called upon this consulate for help to get back to the United States, curs-

ing the day when they left America for Europe, where neither milk nor honey is flowing. *Compared with Europe, the United States is a paradise for a sober and faithful workingman.*"

This point is important, as it has been presented affirmatively to the Commission several times, and it should not go unexplained but be stamped as misrepresenting the condition of labor in both countries.

The Consul at Rheims, in a very recent and important report published upon the "Cotton and Woolen Mills of Europe," writes:

I do not feel that I shall have made this dispatch complete without calling the attention of those interested, among whom are pre-eminently the mechanics and laborers of the United States, to the importance of protection to their own welfare against the productive industries of Europe, which are produced by the hands of pauperized labor. I can see no way in which such protection can be guaranteed except by a high protective tariff or duty being placed and maintained upon all imported goods coming in competition with like goods manufactured in the United States. A "tariff for revenue only" will not accomplish the object, as I view the subject; but it must be such a tariff as will preclude the possibility of the manufactured products of Europe being placed on the markets of our country at a less price than they can be produced with fair profit by our own manufacturers, who employ well-remunerated labor. If, by reason of cheap labor, articles of merchandise can be produced, it must be apparent to every unprejudiced, thinking mind, that to admit European manufactured products without paying a high duty would be to place American capital and American labor in competition with the cheap money and cheaper labor of Europe in the manufacture of articles consumed in our own homes.

You have been told that "the interests of the capitalist and laborer are antagonistic." Such assertion is simple *absurdity*. A single illustration to the contrary is given by the Consul at Manchester, who says:

The shares of the Oldham companies are, as a rule, limited to \$25 each, and this allows workmen and small capitalists to form the proprietary of these companies. They are composed, for the most part, not indeed of the wealthy portion of the community, but of that class who are or have been working people, and who, by thrift and provident habits, have, out of their own earnings, saved small sums of money, and who, at shareholders' meetings and otherwise, very often bring to bear on the management and direction of these companies sound practical knowledge and experience.

One point further in regard to Labor in Europe vs. America. Here are some figures that show a remarkable, but what seems to be an irrefutable, fact, or let him who questions it produce further evidence. The following comparison speaks louder than any other argument.

Manufacturing Industries.

Description.	United States.	Great Britain.*
Hands employed	5,250,000	5,140,200
Value of product.....	\$8,000,000,000	\$4,000,000,000

Here is the positive proof that American mechanics in the aggregate accomplish exactly double the result of the same number of British mechanics. They are therefore very justly paid double in wages.

INTEREST.

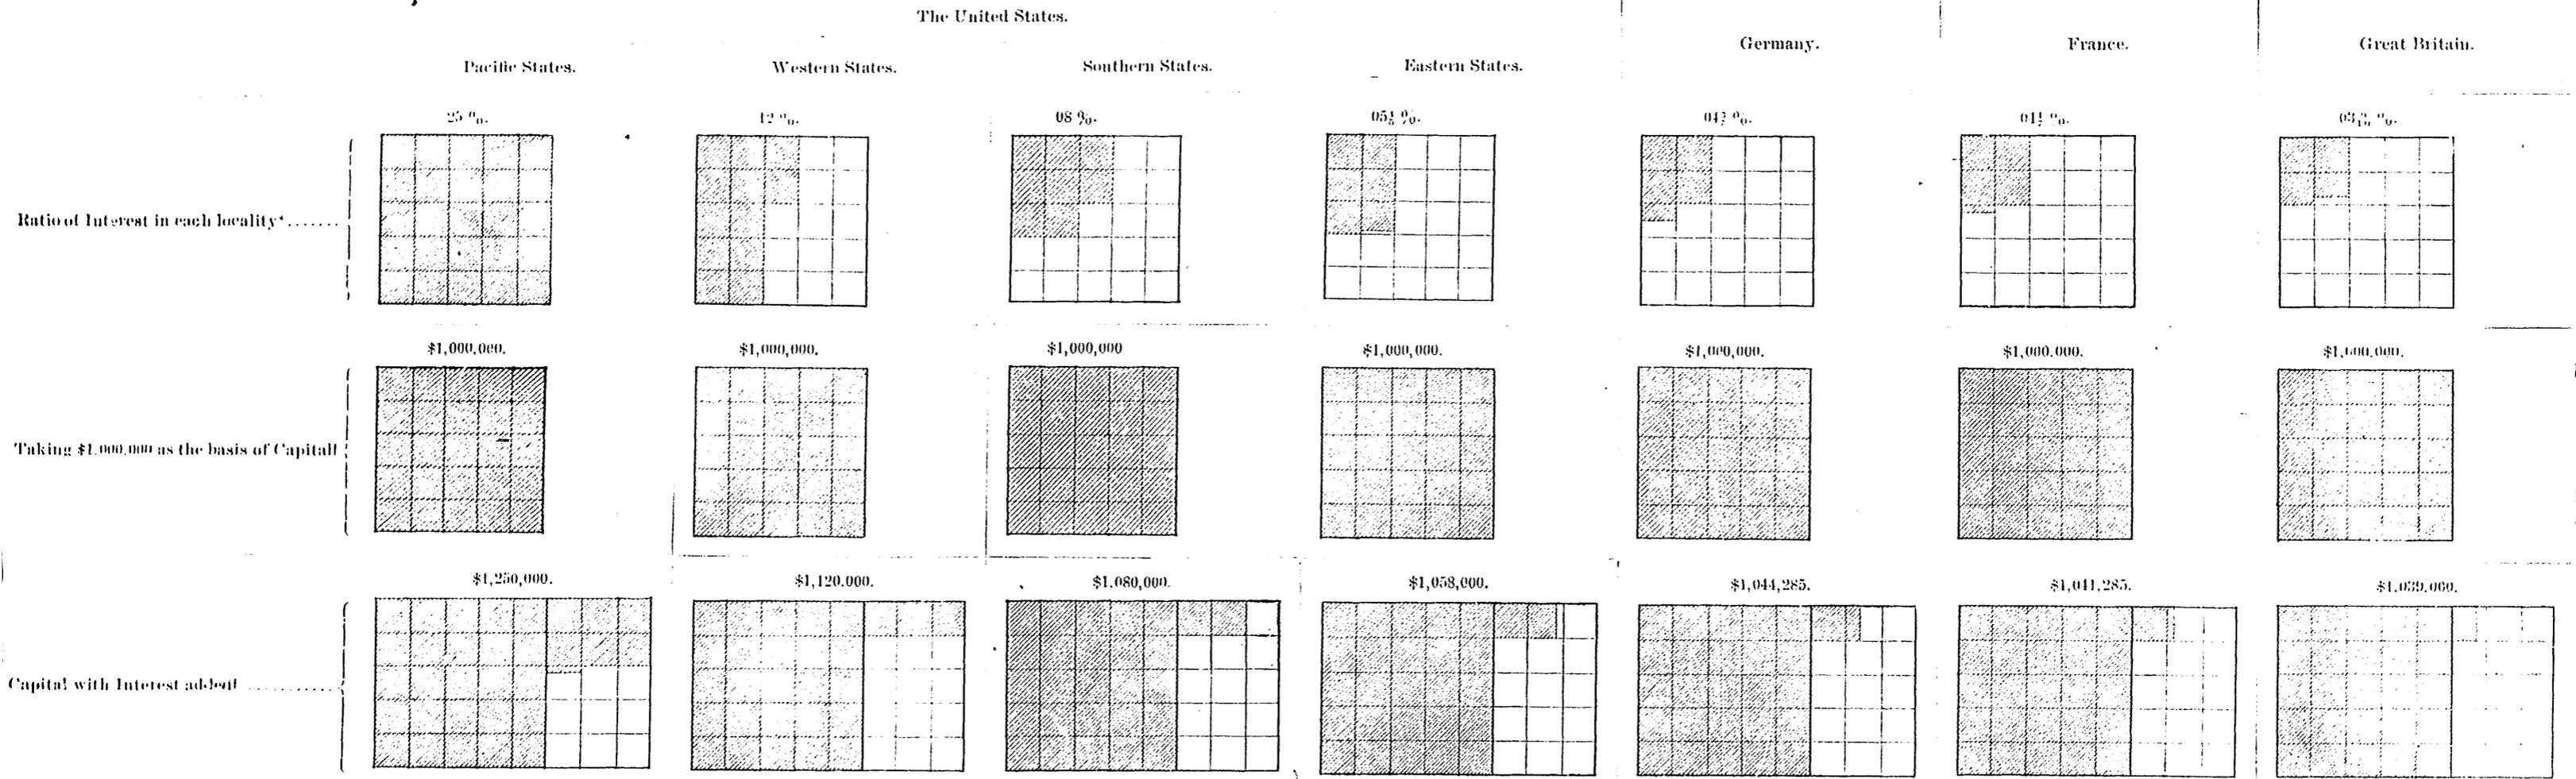

Of the disadvantage to the capitalist or manufacturer it is important to present to you some of the evidences of inequality in the economic condition of the principal countries that handicap and burden his interests. Now look at the condition of Interest upon Capital in Europe and in our own country as shown in Diagram following.

* See also page 16.

CONDITIONS OF INTEREST ON CAPITAL AFFECTING THE RESULTS OF THE TARIFF.

Average for the last 35 years.

COUNTRIES.

* 01 % to the square.

† \$10,000.

The data of this diagram is derived as follows: Of Great Britain, from rates of Bank of England; France, Bank of France; Germany, Dr Soetbeer and Seyd; the Eastern States, from data kindly supplied by Mr. W. A. Camp, Manager of the Clearing House, New York; of the Southern and Western States, from prominent bankers of Mobile, New Orleans, and Chicago; of Pacific States, from the following sliding estimate confirmed by Mr. D. O. Mills, the most eminent Banking authority of the Pacific coast, viz: 1850-'55, 05 % per month; 1856-'60, 03 % per month; 1861-'65, 02 % per month; 1866-'70, 01 % per month; 1871-'80, 06 % per year.

Here it will be seen that Eastward the rate of Interest falls, and that the further Westward, as the proportion in rate of interest increases, so also the absolute necessity for proportioning the difference of customs rates to bring the Industries of our country to an equitable basis at home and abroad, by a Tariff rate sufficient to enable all alike to struggle for success. It will be seen from the foregoing Diagram that the East is in a better condition to abolish protection than the West and South; but should such abolition be considered at the cost and ruin of newer Industries, and especially at higher rates of interest in other parts of the country?

Great Britain is in fact our great American Banker; from that source comes the capital for investment in our Insurance, our Real Estate, our Products, our Railroads, and—she has long since *bought out our shipping*, no old shipping merchant will deny the fact—and draws .08 per cent. Interest from us instead of $03\frac{9}{10}$ at home, on loans; amounting to \$2, 000, 000, 000 or two-thirds of her entire foreign investments, viz. . . . 3, 000, 000, 000 and which necessitates—

an annual remittance from us of. 160, 000, 000

This is where Great Britain's advantage lies in so-called free trade, together with the early developmant of her iron, and therewith her Industries.

It is surely the duty of a Government to make all things equal by economic laws based upon a knowledge of our economic conditions.

So wise, if not perfect, has been such provisions from the foundation of our Government that we find in the 100 years of our country's life, a record unparalleled in the history of nations in the strides of prosperity, as we have seen in Production and Consumption, and also in the value of our Industries.

INDUSTRIES INFLUENCING TARIFF RESULTS.

To illustrate the wonderful advance of our Industries, the following Diagram is submitted for your examination, as it presents comparatively their conditions with those of the principal Nations of the world, leading as we do in three branches, notwithstanding the disparity in age:

NOTE.—In presenting these illustrations, it should be noted that it is anticipated that these conclusions will, on first sight, cause incredulity, owing to the remarkably varied and inharmonious statements and even statistical data of the world.

It is, therefore, well to challenge refutation should any data be thought more reliable than the authorities here quoted, so that by friendly controversy at home or abroad the incompleteness, incorrectness, and inconsistency so reprehensible in the statistical returns of every country may be discussed and exposed.

The authorities selected in preparing these diagrams are, viz, first, Official and United States Consuls; next, British Abstracts, the Statistical Society and its Fellows, of London; Professor Bodio, of Italy; Dr. Neumann Spallart, of Austria; M. De Foville, of France, and Drs. Engel and Sootbeer, of Germany. In home data official figures are taken always.

Referring to note on page 1689, it is also necessary to review the data, illustrated in the foregoing Diagram, relating to our own country.

Our progress has been as follows:

Years.	Manufactures.		Agriculture.	
	Value product.	Increase, per cent.	Value product.	Increase, per cent.
1850	\$1, 019, 000, 000	(Not given) (See below)	} Appa- rent. 200
1860	1, 886, 000, 000	85		
1870	4, 232, 000, 000	123	\$2, 448, 000, 000	
1882	8, 000, 000, 000	90	7, 500, 000, 000	

This is a remarkable picture in two respects: first, in the wonderful development; second, in the wonderful incompleteness of our agricultural data.

Regarding Manufactures there is no question as to the correctness of the above data; *the percentage of three decennial periods*—especially of that period when the South was not included for five years—*prove the figures of 1882 to be reasonable*, if not an undervaluation; but it is also estimated carefully on other data, and although the Census returns are yet silent on this *greatest* industry, except in a small bulletin of a few cities and semi-official items to our statesmen for speeches (see Cong. Record, No. 85, No. 110, &c.), the above can be sustained.*

Regarding Agriculture, the late Superintendent of Census said, in his return of 1870, “no estimate is known that is entitled to more credit than *good intentions*;” and the Statistician of the Agricultural Department, in his return, says, “in fact, the national Census *never agrees with the State* returns—discrepancies and differences always appear.”

Thus the only thing that is not wonderful is the incongruity and inharmony of the official figures of our country.

In examining item by item, however, of our products, as given by the Agricultural Department, the sum of the yearly yield of such products amounts to about \$7,500,000,000. The eminent Commissioner of Agriculture places the total value at \$9,000,000,000. There is, therefore, ample data at hand to prove that the figures given in preceding diagram represent the actual yield last year.

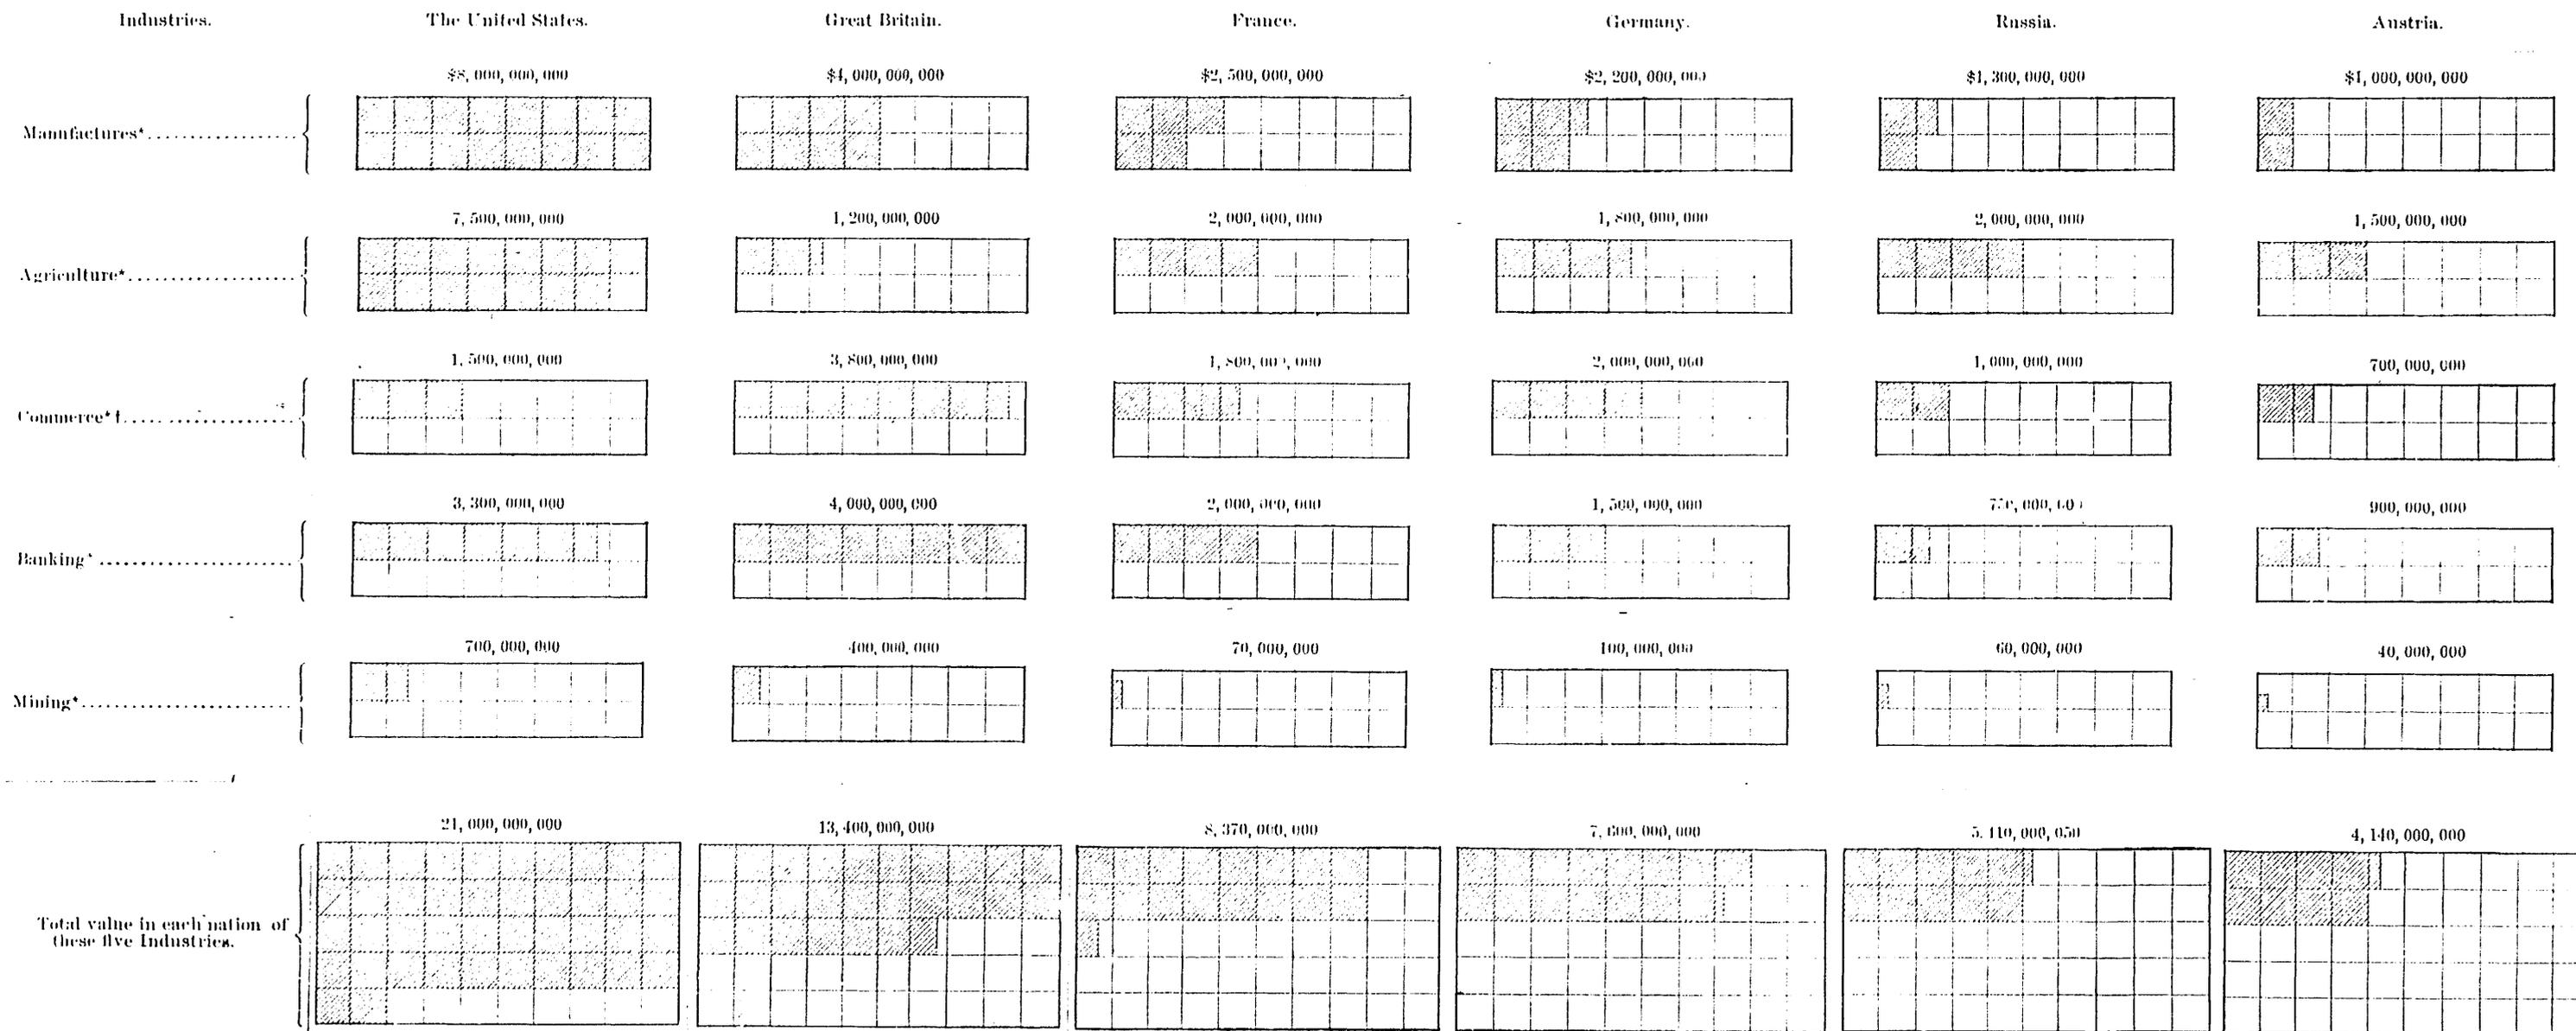

Of our enormous volume of Manufacture, viz. \$8,000,000,000, ninety-eight and one-fourth per cent. is consumed at home, and only one and three-fourth per cent. is exported, viz. \$135,000,000. This fact, with the following, tells the secret of our prosperity:

Of our Agricultural Products, \$7,500,000,000, exactly ninety-two per cent., is consumed at home, and only eight per cent. is exported, viz. \$600,000,000.

Now will Professor Sumner, or any one else, say what would become of our farmers if their manufacturing consumption—really their source of development—were destroyed and they should be left dependent upon the puny demand from abroad.

* Since the preparation and presentation of this Argument, the Census Bulletin 302, giving a general summary of our Manufactures, has appeared. After a most careful study of every figure thereof, the writer finds it most inconsistent and incomplete, and regrets the want of space herein to give further data (which will at a proper time be given to the public) in evidence of such inconsistency and incompleteness; but meanwhile reiterates emphatically the correctness of the estimate of Manufactures herewith presented.

CONDITION OF INDUSTRIES OF THE PRINCIPAL NATIONS OF THE WORLD.

*\$500,000,000 to the square.

† Only foreign commerce is herein considered as affecting the Tariff law.

These data are official as far as possible of each country, and from Consular Reports of United States and Great Britain.
For discussion of these conditions of the United States see pages 15 and 16.

THE NECESSITY OF OUR NATIONAL REVENUE.

To meet our ordinary National expenses, and, indeed, to preserve a healthy regularity in the financial affairs of the country in time of peace or under extraordinary emergencies, it is clear to every rational mind that there must be some economic system from which to derive sufficient revenue.

It is impossible to overlook our Civil and Miscellaneous items, our Army and Navy, Indians, Pensions, and our Interest on the Public Debt. How shall these be met?

This year our condition in Revenue stands thus (June 30, 1882):

Net Expenses, \$257,000,000.	Net Revenue, \$403,000,000.	Excess of Revenue, \$146,000,000.
Customs Revenue, \$220,000,000.	Miscellaneous and Public Lands, \$36,000,000.	Internal Revenue, \$146,000,000.

Here, it will be seen, is an exact offset to our surplus Revenue in our Internal Revenue, if such surplus is as much to be dreaded as some political alarmists are trying to make our people believe; but to show how unnecessary and impossible even this would be, it is only necessary to remind your honorable body that two-thirds of the above surplus will be consumed by new Pensions and other increased appropriations; hence the total abolition of Internal Revenue is out of the question unless our Customs Revenue is increased.

What folly it is, then, to talk about "danger from an overflowing Treasury." Much more so is it for any one to assert that there is no need of Customs Revenue, or that such "is an outrage."

Coming at random from unknown theorists such assertions were little noticed; but, strange to say, the papers of the last few days are crying aloud that a professor of political economy says "we must abolish all protective duties!" The Bankers very properly denounce the Internal Revenue, the poor man everywhere denounces Internal Revenue, and our people would be made Nihilists to-morrow by a Direct Tax imposition at this time of peace, and yet we hear that protective duty is wrong.

Then what is right? What unreasonableness to denounce one system without being able to suggest something better practically! "I am not a statesman at all," says Professor Sumner; "I have never taken upon me to construct a system—that is beyond my line."

There will be a unanimous agreement with Professor Sumner upon this candid admission. He is right, and more frank than others; he has no system whatever to offer, but has only a picture before his view which, in his mind, is "a glittering generality"; but which, as Mr. Medley, of the Cobden Club, so forcibly shows,* would practically be ruinous to American Industries.

TAXATION.

Our great Franklin said, "our greatest tax is from idleness, pride, and folly." He could have added no more!

For an illustration of what would be our condition by wiping out our Customs duties and imposing Internal tax, look at the following diagram of the condition of other countries.

* See pages 1697 and 1698.

It is here seen that France and Great Britain are more severe in their home taxation than any other nations per capita. In Germany the *States* make the heavy assessments of taxation.

But it is not just to rate Russia per capita, as her home tax does not reach all of her estimated 80,000,000 population, viz, of Siberia and some lower parts of Asia.

Russia, in her total home taxation, exceeds Great Britain \$70,000,000, but even estimating her regular taxable population at 50,000,000 it would not average over \$6.10 per capita; hence it is evident that the British people are more severely taxed than the serfs of Russia.

This is the "system of economy" that we are asked to adopt in lieu of present systems of deriving our Revenue from those who wish luxuries, and who can afford to pay extra for the privilege of obtaining an article not made at home and enjoying the pride thereof.

Do our people prefer the luxuries from abroad to the stability that home consumption creates?

We have seen on page 16 that we are not indebted for our prosperity to foreign tradesmen, nor to the demi-idle theoretical luxurist of our country, but to the hard Industry of our Manufacture. You have had before you a gentleman who pleaded for your favor in behalf of the "*fancy cracker*" Industry of England, and who told you pertinently that—

the taste and therefore demand for these articles of luxury has still to be created in the United States, which he believed is to be best done by those who have already an established business in England.

He added—

Our firm employs nearly 2,000 working people. There is another factory of biscuit at Reading, a few miles out of London, employing as many or more people than we do. Some of these factories, I am in a position to state, have invested large sums of money in the business, and I hope you will agree with me that it is an industry worthy of encouragement. We only desire to be put on a fair footing with other industries in this country, so as to give our business here a chance for development. That, in a word, is my case. Charging duty upon packages is a peculiarity of American trade.

Unfortunately, we cannot give up our horrid "peculiarities" or our "charity first at home," no matter how much pleasure it gives, to do other charities second—which, in fact, we do more than any other people of the world.

Two years ago the distinguished and genial gentleman, Mr. T. Bayly Potter, M. P., said to us at a banquet in New York:

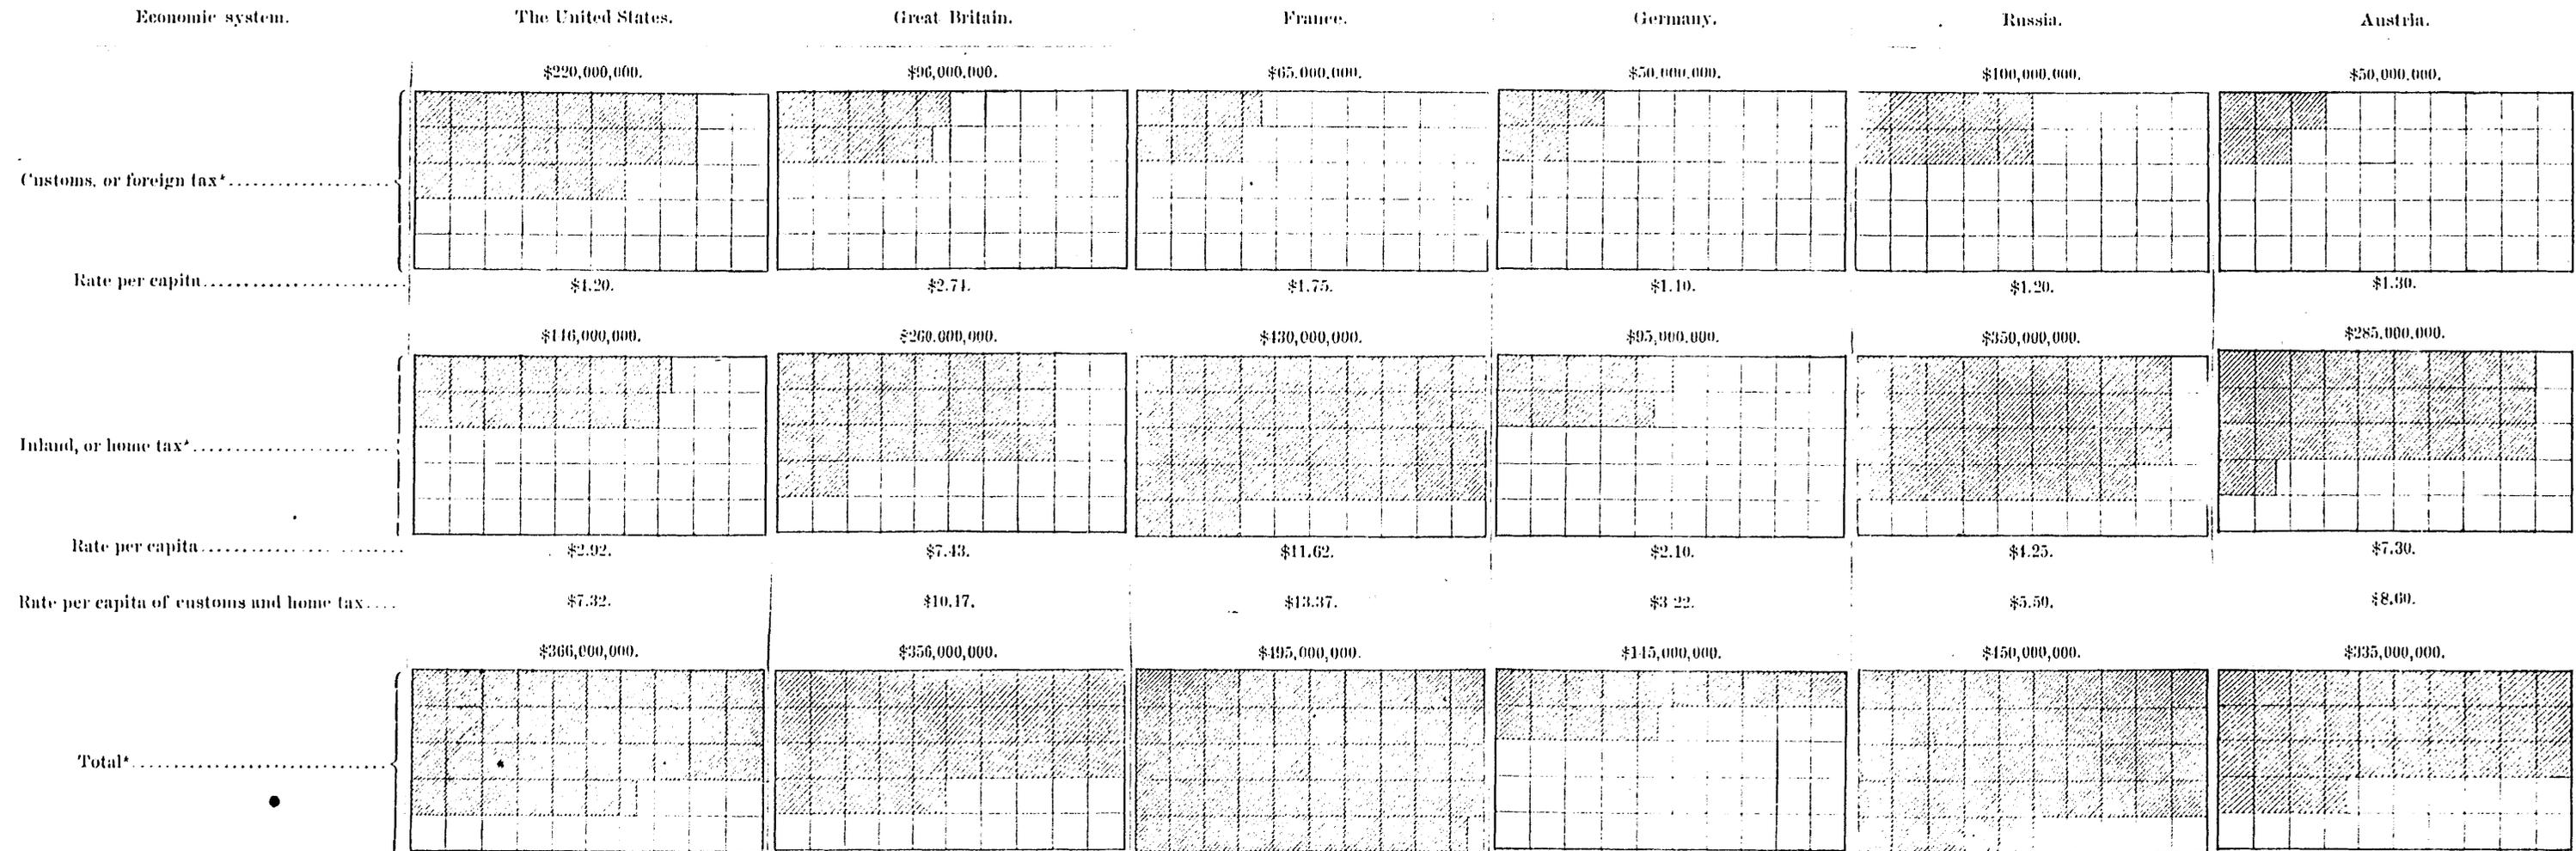

Internally you are the greatest free-trade country in the world; may we not hope that soon you will extend your principles to other lands instead of confining it to your States?

Mr. Potter had not in mind the fact that we buy nearly twice as much from his people as any other nation,* and sell them more cheaply nearly three times as much as to any other nation—or *they would not buy from us at all.*

We spend more in luxury traveling in Europe in one year (over \$100,000,000) than Englishmen do in our country in twenty years; hence we do "extend our principles" and liberality to other lands.

* Export of British products to United States, \$150,000,000; Germany, \$85,000,000; France, \$80,000,000. British Imports from United States, \$525,000,000; Germany, \$130,000,000; France, \$200,000,000.

CONDITIONS OF TAXATION OF THE PRINCIPAL NATIONS.

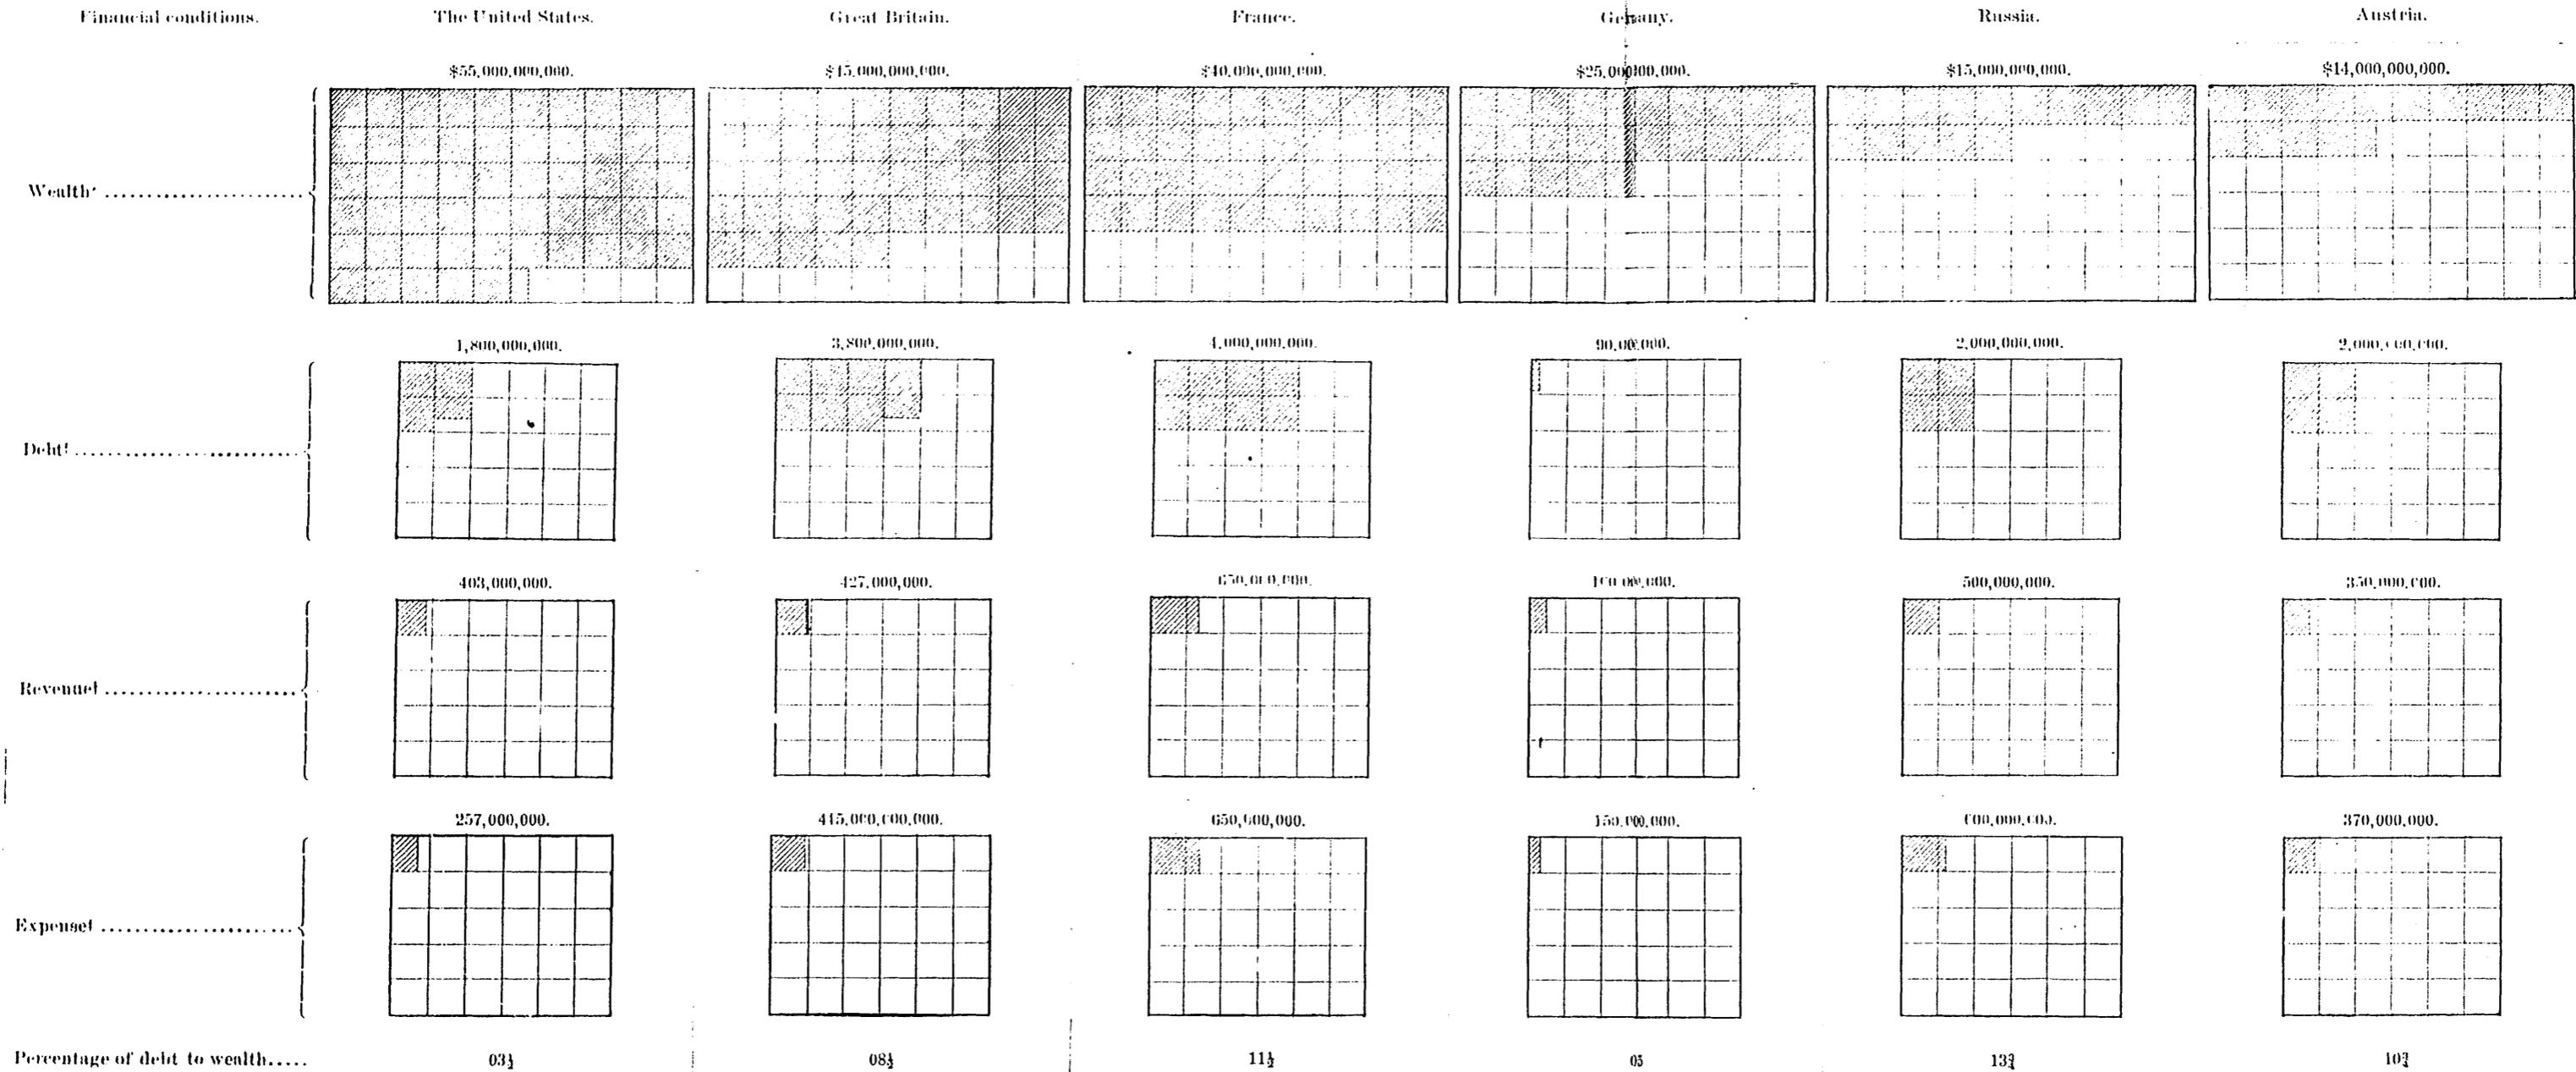

* \$10,000,000 to the square.

In this data the writer is compelled to differ with several unofficial publications which are generally accepted as authority, preferring to stand upon the figures reported as official by the United States Consuls.

It will be seen that the United States receives the largest amount of Customs—not from the highest Tariff, however, but from a larger amount of Imports and is highest in rate of foreign, but lowest in home Taxation per capita, except Germany where the Tax falls upon the people in assessment of the States, so that this data is not an equitable comparison in respect to her Taxation per capita.

THE FINANCIAL CONDITIONS OF THE PRINCIPAL NATIONS.

*\$1,000,000,000 to the square.

†\$500,000,000 to the square.

In this it will be seen that we have become, under our economic system *the richest nation in the world*, and have the smallest percentage of debt. See also Diagram of Taxation.

WEALTH, DEBT, INCOME, AND EXPENSE.

There are other important features to be considered in the conditions of National Revenues, exhibited in the following diagram, which shows Russia the most severely indebted Nation; Austria, second; France, third; Great Britain fourth, and the United States last and in the most healthy condition.

The remarkable volume of Wealth of our country seems so great that it may be regarded as incredible at first sight. Careful examination and research, however, prove that it is not even as bold as the estimate, or rather speculation, made some years since, as officially imprinted upon our country's record:

[From the Congressional Record of March 6, 1878.]

Mr. David A. Wells, the former very able and intelligent special Commissioner of the Revenue, in his report some years ago furnished the country with exceedingly interesting and instructive information on this subject. Speaking of our national debt he showed by the following table how its burden would diminish if we would just let it alone. He shows:

The estimated percentage of the national debt to property from 1860 to 1900.

Year.	National wealth.	Percentage of debt to property.
1860.....	\$10, 150, 000, 000
1870.....	32, 318, 000, 000	7. 84
1880.....	64, 630, 000, 000	3. 92
1890.....	120, 272, 000, 000	1. 96
1900.....	258, 514, 000, 000	. 98

There is no evidence to prove, more than that represented to you on the preceding page, viz, that our Wealth is to-day \$55,000,000,000, and hence it is impossible to muster the courage to magnify its volume to a greater degree in order to reach Mr. Wells; but upon the volume given in the Diagram you may rely as the minimum estimate.

What will be our Wealth in 1890 or 1900 depends entirely upon the wisdom or weakness evinced at this time by our statesmen, and upon your recommendation; whether it approximates to the enormous estimate above or deteriorates to a lower basis than enjoyed to-day.

The wealth of nations, France and Italy conspicuous examples, has before been dissipated as easily as the wealth of individuals; and here it is apropos to quote again from the Royal Agricultural Commission Report, which says:

It is safe to say that for the last two years the agriculture of America has been at the very flood tide of its prosperity. How long that tide will flow till it begins to ebb, it is not my province to speculate upon; but as certain as the sea breaks over the rock-bound shore, so surely it recedes again and leaves dry ground behind it. Thus in agriculture, as prosperity floods upon us, some have to meet an evil day.

This is from an official paper of Great Britain of only two months since:

Upon your honorable Commission then, gentlemen, rests a heavy responsibility. It may influence good or evil results by wise or unwise presentation of our condition to our statesmen, who await the evidence you have gathered and the recommendations you may have to make.

THE INFLUENCES OF OUR INTERNATIONAL RELATIONS.

There is no influence so great upon International Relations as a Merchant Marine, and yet in this we are impotent, while every other Nation of prominence is awakening to the importance of revival in strength and activity.

Prince Bismarck has sounded the tocsin for Germany, and says:

On the day the freight trade is given over to foreigners a mortal blow will be dealt to all the industries of the country. It would be an anomaly, from a national standpoint, to cede the transport trade to industrial rivals. In choosing those to export home products people expose themselves to all kinds of foul play, not only in competition, but also to adulteration of goods.

This is from the Chancellor of Germany; and he adds:

*It is deserving of serious consideration whether, under the circumstances as given, German shipping and German commerce can hope for further prosperous development as against the competition of other nations aided by public funds and assistance.**

France has redoubled her national support to ship-building and ship-owning:

The foundation to a further subsidized French steam line has been laid simultaneously with the promulgation of the law for granting general privileges to the merchant service. In consideration of the circumstance that the French flag is not adequately represented in Australian waters, that the share of the French trade to and from Australia does not assume dimensions corresponding to the importance of France, that new markets were to be opened there to French industry, and that the present moment was a most favorable one, as France had gained a footing in the exhibition of Sydney and Melbourne; in view of all these circumstances it was determined to open a subsidized line of steamers from France to Australia, with a communication to New Caledonia. This line would, for the present, arrange for thirteen voyages there and back per annum, and receive for this a subsidy to the amount of \$336,900, it being reserved later on to double the voyages with a corresponding increase of subsidies.

Italy has just made a large appropriation, as shown in official document No. 24 "Consular Reports," p. 507, as follows:

PROPOSED BOUNTIES TO ITALIAN SHIPBUILDERS.

I. For the construction of the hulls of iron steamships there shall be accorded the following bounties: Up to 100 tons burthen, \$6 per ton; up to 800 tons burthen, \$8 per ton; above 800 tons burthen, \$12 per ton.

For the machinery the bounty will be \$12 per horse-power, nominal, and \$1.20 for 224 pounds weight of boilers.

The privilege of exemption from duty, provided by the law of 1872, will be removed, so that if the builder shall import his materials, in whole or in part, he will pay duties the same as in other industries. For repairs, exemption of materials from duties will continue, whether the ships be national or foreign, for the reason that such work cannot be valued so as to apply the system of bounties.

II. A bounty of 10 cents per ton of net cargo for every 1,000 miles run, whether in over-sea voyages or "grand" coasting, *i. e.*, every voyage beyond either the Dardanelles, Canal of Suez, or the Straits of Gibraltar. This bounty to be extended also to all sailing vessels not over 15 years old. The bounty will be diminished yearly $\frac{1}{10}$ th for steamships and $\frac{1}{20}$ th for sailing vessels.

III. Steamships and sailing vessels not receiving bounties shall be exempt from income (*ricchezza mobile*) tax.

IV. Harbor dues (*tassa d' ancoraggio*) will be lessened for steamships and increased for sail.

V. All written instruments concerning the construction or sale of ships shall not be subjected hereafter to a proportionate tax, but to a fixed duty of 20 cents. All taxes will be removed from licenses and other instruments prescribed by the code of the mercantile marine.

VI. The tax on insurance will be reduced.

Consul Crain, of Milan, comments on the above timely action in the following forcible manner:

"It has been said that these measures are intended only as a defense

* For the full Appeal of Prince Bismarck for subsidy, as essential for German shipping, see Consular Reports, No. 9.

against the French bounty act of January, 1881; but after a careful perusal of the testimony taken by the commission, I can draw no such conclusion. Rather does it appear that a deep conviction possesses the Italian mind that a nation, to be truly great commercially and politically, must be strong in ships and steamers; that its own flag must pioneer its trade; that a strong mercantile marine is the necessary adjunct of a strong navy, and that both give weight at the council board of nations. The lessons of Tunis and Alexandria will strengthen this conviction.

"In its commercial aspects, at least, if not in its political, the judgment formed by this commission, after a patient and exhaustive investigation, should receive the careful consideration of the government and people of the United States.

"To us the subject is of great concern, for, with our resources, Congress, by proper legislation, may accomplish two objects of transcendent importance: it may revive our commercial marine, and at the same time insure the laying down of our surplus crops in the marts of Europe at a cost that will secure them there a permanent market. Thus the industry of agriculture will be protected; and, backed by the farmer, no party and no statesman need hold back."

Mexico, Austria, and Russia, have also been aroused recently to the necessity of national subvention to steamships.

We are told that the decadence of our shipping is due to our Tariff.

Then why, if a Tariff is destructive to a ship, is it not also to our iron interests? They are analogous cases, yet who will have the courage to say our Iron Industry has been injured thereby?

Did a tariff of three cents per pound destroy the development of cotton? Has a tariff on tobacco, on wool, or on silks, destroyed those Industries in our country or developed them?

The Hon. Mr. Tucker, of Virginia, claims that our tonnage advanced until 1860, but the official records show that the highest point reached in our Shipbuilding Industry was in 1855, 583,450 tons; and declined as follows, 1856, 469,393 tons; 1857, 378,804 tons; 1858, 242,286 tons; 1859, 156,601 tons; 1860, 212,892 tons. So also the highest point in tonnage owned in the United States was, in 1856, viz: 5,681,394 tons.

Our Shipping was destroyed under a low Tariff, and by those advocating a low tariff, by men who had large interests at stake in England and receiving advances therefrom on their Cotton product.

The distinguished member from Virginia also asks—

Does free trade destroy shipping? Does protection advance it? If so, why does free-trade England outstrip protective France and the United States?

The Parliamentary Papers of Great Britain abound with evidence in abundance in the records from 1836 to 1860. Neither "Free Trade nor Protection" have anything more to do with the profits of ship-owning than the system of Oxford has upon morality in our country.

English ship-owners do not make their profits from "free trade" in England, but by carrying for others (ourselves especially) who did not possess the foresight of her statesmen or fostering care of her Board of Admiralty, the bounteous aid of national subventions, the monopoly of the British Lloyds, and British Consuls as Steamship Agents, and British financial houses in every part of the world.

Iron was first used for shipbuilding, in England, in 1836. (The first registered at "Lloyd's" were the *Sirius*, 1837, and *Ironside*, 1838). In 1840 it was earnestly advocated, but not until some years after adopted "in deference to the Right Honorable First Lord of the Admiralty,

then Chancellor of the Exchequer." Iron was not perfectly utilized for some years after. The knowledge, however, was acquired, and British statesmen foresaw the advantage and *abolished their navigation laws in 1849, to invite the world thither to a ship market*, because the monopoly was already established.

It was at a period when our country was disturbed by disunion dissensions, and a crisis anticipated, that Mr. Toombs, of Georgia (principally), led others in our National Chambers to sympathize with British vs. American shipping at that period (1856), as shown above, when our Merchant Marine was struck an unnatural blow and deserted at the moment of the grandest contest between Great Britain and our country.

Industry is more powerful than warfare, and, strong in iron and backed by the British Exchequer, Great Britain drove us from the high seas five years before our civil conflict. The British historian, Mr. Lindsay, tells the reason "why England outstripped the United States" in shipping:

"Under such circumstances, unusual efforts were necessary to maintain our (British) position as the FIRST of maritime nations. We had, however, one advantage which our American competitors did not possess. We had iron in abundance, and were directing our attention to the construction of iron ships, to be propelled by the screw. * * *

"It is a grand story to tell, one far more worthy of record than the wars for maritime supremacy between Rome and Carthage, or than, perhaps, some wars of more recent times, which, without any apparently useful object, have stained land and sea with the blood alike of the victorious and the vanquished, rendering desolate many a once happy home. The war I relate was a far nobler conflict, consisting as it did in the struggle between the genius, scientific skill, and industry of the People of two great nations, commenced, too, and continued throughout without bloodshed."

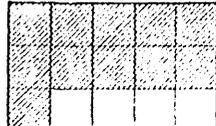

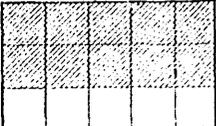

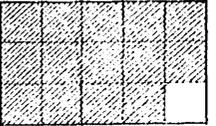

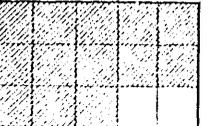

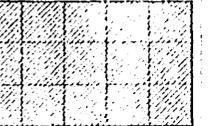

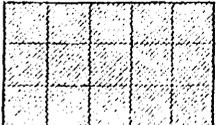

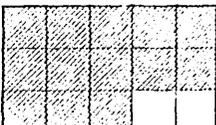

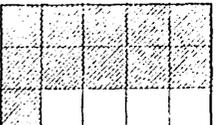

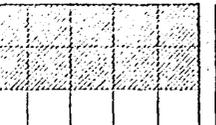

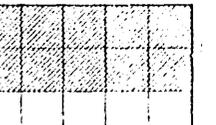

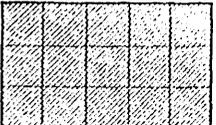

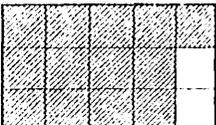

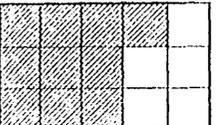

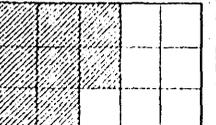

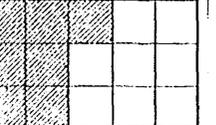

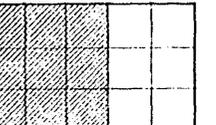

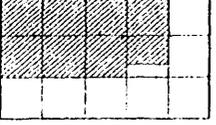

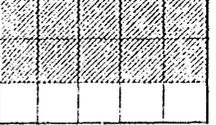

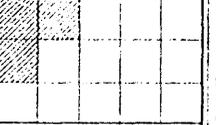

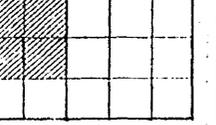

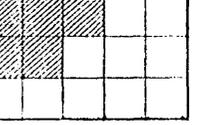

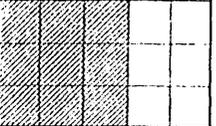

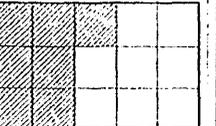

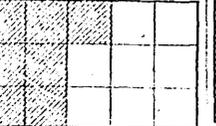

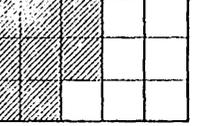

A regard for the memory of the late Mr. Lindsay, who so eloquently and truthfully inscribed the epitaph of the American ship, and the proud record of British Industry on the pages of England's history which Americans must remember and reread with the acute sting of chagrin that gnaws, from national mortification and national dependence until removed by national wisdom in re-establishing our former prestige—should hush the assertion in Parliament that the lost influence in our International Relations is due either to free trade or protection! it was due to iron—iron in the ore and iron in manufacture—floated for years by the British Exchequer.

Attempts of every character have been made in our halls of legislation and in the public press to hide the true cause of the prosperity of British Shipping and the true reasons for the decline of our own, and to try and confound the conditions of Shipping with the Tariff of Customs, but the truth is as indelibly written in history as the development of Industry that iron and national subvention are the chief cause of the former and neglect and abrogation of national faith the reasons for the latter.

England subsidizes now *three* Steamship companies alone to the amount of \$3,000,000 annually, and will unquestionably double us tomorrow, dollar for dollar, in such subventions wherever competition enters, and the only question is: What is the necessary amount? To answer that the amount would be illimitable would be as foolish as to assert that the youth had no benefit from fostering care in the long contest of life, but until our statesmen adopt this wise policy of England, we must bow our heads in humility and pay our tribute of \$150,000,000 yearly in maritime servitude to foreign countries.

Look at our Shipping conditions compared.

CONDITIONS, ADVANTAGES, AND DISADVANTAGES OF OUR MERCHANT MARINE COMPARED.

The Ship.	The United States.	Great Britain.	France.	Germany.	Russia.	Austria.
	1-10th more.	10-10ths.	4-10ths more	3-10ths more.	5-10ths more.	5-10ths more.
Ratio of cost in building (Taking Great Britain as the standard.)

Ratio of completeness in model and comfort.						
	30 years.	26 years.	20 years.	16 years.	14 years.	18 years.
Ratio of life in sea service (2 years to square.)						
Ratio of support by Government						
Ratio of Insurance advantage						
	Depreciated in foreign ports by foreign Underwriters.	Built up in "infancy" and growth by Government, and fostered additionally by British Lloyds, Consular and Banking facilities.	Fostered by Government as a national necessity.	See Prince Bismarck's Appeal, page 20.	Revival since 1880, by national subsidy.	Competing now with England, France, Italy, Russia, and Mexico in national subsidies.

These conditions are presented with proof at hand to substantiate the same.

France, Germany, Italy, Mexico, and other nations have just provided for having increased Subsidies to Mail Ships.

The United States Commercial Marine was destroyed in 1856-'57, under a low tariff, at a period when the disruption of the Union was anticipated.

Owing to subsidised competition and to partiality of the British Lloyds' Insurance agents in every foreign port in freight rates, the United States marine has never been able to recover the lost prestige: the Tariff had nothing to do with the decadence of our shipping.

The fostering care of the United States over her Merchant Marine can only be seen with a microscope; the neglect and shameful trifling therewith are indelibly written in our country's records—see appeals of Webster, Bayard, Badger, Rhett, Polk, &c., Congressional Globe, 1850-1856.

The two conspicuous features of Foreign Relations with all honorable nations are—

Self-Protection and
Good Faith in Reciprocal Treaties.

We have no Conventional Treaties binding us to a particular system with the principal nations; those existing are with smaller nations; but we have every reason to concede everything reasonable toward reciprocal international trade with all nations, especially to favor Great Britain, bound as we are by ties of consanguinity, and language, and Christianity.

There is nothing, however, more beneficial and developing to our Industries than the influences of international relations and competition.

Between Great Britain and our country there has been and will always be an industrial rivalry; and we earnestly echo the motto of the great British League, the Cobden Club, "Peace on earth"—in Industry as well as in Diplomacy—"good will among Nations."

Does this mean, however, subserviency, or does it even necessitate a resignation of our own interests, our own judgment, our own practical experience to that wisdom and foresight that have so peculiarly guided Great Britain?

Would it be consistent in us to accept such guidance merely for the gratification of foreign interests?

We are told by many Free-Trade advocates to-day that we would be blessed with greater prosperity were we to follow the advice and importuning of Mr. Bright and the Cobden Club, and is it not just to listen and consider this deep solicitation with appreciation?

Aside from preferences or dogmas of our own, let us listen to advice. Mr. Bright says, speaking of England:

In our protection days our weavers and artizans could not exchange with American flour; they exchanged with an English farmer, who gave them sometimes only half the quantity the American would have given.

Mr. Newton Crossland, a wealthy English farmer, replies:

There is a shallow plausibility in this passage (of Mr. Bright) which is calculated to deceive the unwary; it is a trap cunningly laid for the American mind, and I guess the game will be clever enough to detect the snare.

What does this mean? that our British friends are coaxing us into an economic snare?

Two years ago the Cobden Club flooded our country with an appeal "from the American Farmer's friend."

But last year, when Lord Derby and Sir Edward Sullivan, two of the few British land-owners, started a large following in favor of Protection, the Cobden Club flooded England with Mr. Medley's argument on "Reciprocity Craze," (which argued much more sensibly, frankly, and practically than "the friend of the American farmer"); urging the English people that they should reflect and weigh the facts carefully.

He says, under the seal of that club:

[SEAL:] COBDEN CLUB—FREE TRADE—PEACE—GOOD-WILL AMONG NATIONS.

Has any one ever seriously considered the possible effects, immediate and remote, which might arise? (from change in the economic policy of either country).

Among them would be—

1. A sudden and vast demand for labor at home.
2. A sudden and a great increase in wages.
3. A rapid increase in the number of our factories, workshops, mills, furnaces, &c.
4. A rampant speculation in everything connected with trade and manufactures.

5. A general rise in prices distressful to those with fixed incomes.
6. A rush of population from home and abroad to our manufacturing centers.
7. A stimulus given to marriage and population.
8. A demoralization of our laboring classes.
9. Strikes for an increase of wages.
10. The culmination of the foregoing.
11. The beginning of a reaction owing to the commencement of foreign competition.
12. The commencement of a fall in prices.
13. Labor disputes and strikes against the fall.
14. Progress of the fall in prices.
15. Failures of mill-owners and manufacturers; closing of mills and factories, and blowing out of furnaces.
16. Laborers thrown out of employment, and consequent increase of pauperism and crime.
17. Extreme depression takes place.
18. The usual healing courses have to be followed.
19. After some years of suffering things settle down pretty much as they were.

All this is based on the sudden opening of foreign ports. A gradual opening would, of course, modify the process, but the ultimate result would not be different. One of the results which would most probably happen is, that our population might be increased by two or three millions more than it otherwise would be. But then several questions arise, such as, "Would the nation then be absolutely or comparatively better off?"

Free Trade introduced into Protectionist countries *would disorganize their industries, ruin some of them, and cause a general displacement of capital and labor.* Effects the converse of those described as happening with us would take place with them. At last a basis would be found. Then would rise everywhere a real and keen competition with us.

Here, Gentlemen, are quoted three of the highest authorities of England as to what is, and what would be, the effect of Free Trade in foreign countries, especially in our own. It is far from siding with Protection or Free Trade; it is simply a duty to present to you from the highest British authority, from the Cobden Club, their insight, foresight, and correct sight of what would be the result of following the theories that were beautifully urged upon you by Professor Sumner, viz:

"Disorganization of our Industries—ruin to some."

No matter what "the reaction" after "a basis was found" should be, have you any right to disorganize all and ruin some of our industries because our English friends have induced some of our countrymen to lead for this spoliation to us and benefit to them?

Is it generous in Mr. Bright, as Mr. Crossland says, to deceive us? Is it noble in the Cobden Club, as Mr. Medley says, to induce our literary, collegiate and impracticable men to bring upon us "disorganization and ruin?"

One allusion further, as it bears with the greatest weight upon the work of the Tariff Commission, and if permitted to go unnoticed will convey in the loudest and boldest sounds a fallacy that will be prejudicial to our true economic conditions, and a false representation against all our Industries.

The Journals of this week contain the evidence that money is pouring in to break down our present laws and conditions, which are here reviewed upon official and reliable data only, and without partiality *pro or con.*

A gentleman sends to the President of a political Club \$1,000, and offers more to further his prejudices against the protection of American Industries in this country, and adds:

Free trade in England has given the workingman higher wages and yet has lowered his living expenses; but here, under protection, his living expenses have troubled, while his wages are scarcely changed. The wages of a cotton spinner are as high in England as they are here, yet the protectionist professes to be the special friend of

the factory hand. England is compelled to import largely both food for her people and raw material for her factories. Here we have both in abundance, so that with free trade we could undersell England and the world. To what greater advantages than these are manufacturers entitled?

The amount of \$1,000 is of little value compared with correct figures in an economic argument, and it is not correct that the wages of the cotton factories in England are, on an average, greater than in this country. Good spinners are in demand in England, and, as will be seen on page 1688, share in the dividend of profits, but there are fewer hands employed than in our country.

It is hardly just to make a comparison because of the different descriptions of employment in the two countries; but in addition to the authority quoted in the foregoing pages from Mr. Evarts's Report on Labor, it is well to add the following table as given in the "Cotton Report" of Ex-Secretary Blaine, which shows the true condition of wages in that industry:

*Wages and hours of labor in the cotton-mills of Massachusetts.**

	Goods manufactured.	Pay of spinners per week.		Pay of weavers per week.		Pay of piece weavers per week.*		Hours of labor.		
		Highest.	Lowest.	Highest.	Lowest.	Highest.	Lowest.	Five days.	Saturday.	Per week.
COTTON.										
1	Cottonades	\$10 00	\$4 86			\$10 00	\$3 50	10	10	60
2	Cotton cloth	11 41	11 08	\$10 18	\$7 02	23 10		10	10	60
3do	8 50	3 50	8 50	4 20			10	10	60
4do	6 00	3 50	8 00	4 00			10	10	60
5do	9 00	3 00	10 00	4 50			10	10	60
6do	11 42		10 02	2 70			10	10	60
7	Cotton goods	11 01	0 00			9 70	3 50	10	10	60
8do	10 00	5 00	7 50	4 50			10	10	60
9do	10 00	5 00	7 00	4 00			10	10	60
10do	9 00	8 00	6 00	4 50			10	10	60
11do	9 50	7 25	10 71	5 81			10½	7½	60
12do	11 70	10 08	8 00	4 00			10½	8½	60
13do	12 00	8 00	11 00	7 50			10½	7½	60
14do							10	10	60
15do	10 00	0 00	7 20	4 50			10	10	60
16	Cotton goods and hosiery	0 00	6 00			9 00	3 60	10	10	60
17	Prints	9 60	8 40	9 00	4 50	9 00	4 50	10	10	60
18	Cotton and worsted goods	12 00	5 40	11 00	7 00			10	10	60
19	Cotton duck and yarn	4 20	3 65	10 00	4 00			10	10	60
20	Cotton flannel			9 00	3 50	0 00	3 50	10	10	60
21	Ginghams	10 00	7 50	10 00	6 00			10	10	60
22	Print cloths	13 36	10 25	10 08	5 04			10	10	60
23do	11 50	0 00			10 08	5 00	10	10	60
24do	9 00	7 00	7 00	4 00			10	10	60
25do	10 00	7 00	8 00	4 00			10	10	60
26do							10	10	60
27do	13 25	10 00			11 08	7 62	10½	7½	60
28do	10 02	9 70			9 52	6 20	10	10	60
29do	11 80	10 43	8 00	5 50			10	10	60
30	Sheetings, shirtings, &c	9 30	7 20	7 50	5 30			10	10	60
31	Sheetings, silsesias, and fancy cottons	9 00	4 50	8 25	6 00	9 50	7 00	10	10	60
32	Towels and cotton duck	6 00	3 50	7 00	4 00			10	10	60

Here it is seen that the highest wages to a spinner in this country range from \$10.08 to \$13.36, while in the table following of English rates the pay ranges from \$7.20 to \$12 with a reduction of 10%.

* Taken from official Report of Hon. C. A. Wright, Chief Bureau of Statistics; see also Appendix for comment on "Piece-Work" Labor.

WAGES OF ENGLISH FACTORY OPERATIVES.

The following average earnings per day of operatives in the Consular district of Manchester have been carefully prepared, and represent fairly the wages of this great manufacturing center.

Average earnings per day in an East Lancashire cotton-weaving mill.

[Hours of labor, 56 per week.]

Weavers, 3 looms	\$0 64 to \$0 72	} Jan'y 1, 1880.—At present subject to a reduction of 10 per cent.
Weavers, 4 looms	80 to 96	
Weavers, 6 looms	1 20 to 1 44	} January 1, 1880.—At present subject to a reduction of from 5 to 10 per cent.
Weavers, children (half-timers).....	14	
Beamers or warpers	64 to 80	} At present subject to a reduction of from 5 to 10 per cent.
Winders	40 to 72	
Tapers or sizors	1 20 to 1 68	} At present subject to a reduction of from 5 to 10 per cent.
Tacklers or overlookers	1 12 to 1 68	
Engine-drivers and firemen.....	96 to 1 68	

Average earnings per day in an Oldham cotton and spinning mill.

[Hours of working, 56 per week.]

Mule overlookers	\$1 60 to \$2 00	
Carder	1 60 to 1 80	
Strippers	} 96	} Less 10 per cent.
Jobbers		
Grinders.....	} 72 to 84	} Now working on 15 per cent. reduction on these rates.
Drawing and slubbing hands.....		
Intermediate and roving hands.....	68 to 84	
Little tenders (full-time)	36	
Little tenders (half-time).....	16	

Average earnings per day in a Blackburn cotton-spinning mill.

[Hours of working, 56 per week.]

Spinning masters and carders	\$1 20 to \$2 00
Spinners.....	1 20 to 1 40
Piecers	46 to 56
Creolers	28 to 34
Rovers	58 to 66
Slubbers.....	50 to 60
Drawers	52 to 56
Grinders.....	85
Blow-room hands	48 to 85
Engine-drivers.....	84 to 2 00
Firemen	64 to 84

The employments represented by the lower rates of wages (say from 28 to 72 cents) are filled chiefly by women or girls and boys. In Haworth's mill, one of the largest and finest in this district, where 2,500 operatives are employed, 70 per cent. of these are women; 40 per cent. of the women are under twenty years of age, and 10 per cent. of them are under fifteen. This may be taken as approximating to the general average percentage of employment so far as sex and age are concerned.

FREE IMPORTATION RAISES PRICES.

Nor is it correct that low tariff reduces the cost of an article.

In 1871 we abolished the tariff on Coffee, but instead of a fall in price, that workingmen might buy, it went up in Brazil at once, and so high that the difference equalized the rate of the Tariff before.

In 1872 we abolished the duty on Tea, and likewise the price rose to the same rate as with the duty.

In 1874 we admitted Coal from Nova Scotia free, yet immediately the price rose, to the benefit of the Nova-Scotians.

In 1879 we abolished the duty on quinine, to which more detailed reference is made on page 1707; and yet it retained the former value, or very

close thereto, and also shut out our manufactories of same from its manufacture.

PROTECTION REDUCES PRICES.

It is unnecessary to cite Iron and Bessemer Rails; you are fully informed upon these items, but the principle herein maintained has never been more clearly presented than in the following table, from a recent speech of the Hon. Mr. Carlisle, in Congress, which shows that protective duty has forced the prices down first in England and then in the United States:

Years.	Price in Eng-land, free on board.		English price.	Price of Amer-ican steel rails in gold.	Difference in price.	Rate of duty.	
	£	s.				Percent.	Per ton.
1804	17	12	\$85 65	\$148 50	\$62 85	45
1805	10	7	70 50	127 50	47 04	45
1806	14	10	70 50	117 50	46 04	45
1807	13	10	65 70	113 28	47 58	45
1808	12	12	61 32	105 00	43 88	45
1809	11	6	54 00	97 38	42 80	45
1870	10	7	50 37	91 17	40 80	45
1871	11	0	51 00	91 18	36 10	\$28 00
1872	13	18	67 04	98 43	30 70	28 00
1873	10	9	80 05	103 01	33 00	28 00
1874	13	2	08 75	85 76	17 01	28 00
1875	0	2	44 28	59 75	14 97	28 00
1876	0	12	32 12	44 97	12 75	28 00
1877	0	0	20 20	42 08	12 88	28 00
1878	5	5	25 55	42 00	16 45	28 00
1879	5	10½	26 88	48 25	21 37	28 00
1880	7	1½	31 36	67 50	33 14	28 00
1881	6	10	31 53	60 00	28 47	28 00
1882	6	7½	31 10	57 00	25 00	28 00

Chalk, Cottons, Glycerine, Licorice, and other articles, offer the same proof, as will be seen in Appendix.

LABOR CONSUMES PROFIT.

We have seen on page 1688 that labor in the United States produces double the value in the aggregate volume of Manufacturing as in Great Britain, but this fact should not cause us to lose sight of many of our youngest Industries that are struggling for existence against great odds in rates of Interest and Labor, upon which especial argument is made in Appendix.

THE TARIFF LAW.

The League recognizes the delicacy of attempting to improve a law of so important a nature, and with great hesitancy makes the following suggestions generally rather than definitely in this necessarily limited manner, regretting that time does not permit a longer consideration and more deliberate reflection, to make a revision "*verbatim et punctatim*," in a clear and complete manner, necessary to guard hereafter against the ambiguity and complexity peculiar at present.

Before coming to our Schedules and the revisions thereof, let us note in detail some points in our Tariff that have not only perplexed our officials and business men in many ways, but also the Courts of the country.

CONTRADICTORY DECISIONS OF CONTROVERTIBLE QUESTIONS.

It is frequently asked if the decisions of the Treasury Department become part of the Revised Statutes. Fortunately *not*, for such rulings are more frequently reversed and unjust than the precedents of our courts. To this important subject especial attention is asked to a review thereof in Appendix, under "Tariff Tribunals."

SIMPLIFICATION.

There are many of these points susceptible of simplification by a little modification or alteration, and others that appear remediable, but which upon careful study and experience prove to the contrary.

First of all is the determination of

VALUATION.

In mixed goods especially, the difficulty should be alleviated by determining the value *by the chief material* of the article; by this system the article will protect itself or else result in benefit to the home industry, and protection against fraud. For instance, if the superior article is mixed with inferior thread and the foreign importer objects to the highest rate of value, it will tend to stop the inferior goods from entering into competition with pure American goods; or if there is any demand for mixed goods, let our own manufactures have that privilege rather than permit the injustice of unfair competition.

The simplest proposition would be that so earnestly and for so long a time advocated by Mr. David M. Stone, of New York, viz, to make a uniform rate for all textiles; but that is impracticable, for it is evident that it would be unfair to rate cotton goods, with the immense yield of this home product, in uniformity with silk, a foreign product; nor would it be fair to our silk-manufacturers to depreciate their value to one much lower by an average of the two rates; and so, also, with woollens. By giving the mixed article the value of its *chief material*, as above suggested, it seems at least the most equitable solution.

VERIFICATION OF VALUE.

The United States Consuls make Quarterly returns of Certified Invoices of all goods shipped from their Consular Districts.

A decided improvement and great assistance can be effected by the Consuls of the United States abroad in forwarding monthly or weekly, instead of quarterly, certified invoices and prices current. It is now a quarterly system and very imperfect for the purpose intended. But provision should be made by Congress to compensate our Consuls sufficiently that they may employ clerks to do this extra work. These statements should be reduced in valuation to United States money, and equivalents in weight likewise, and supplied to every Collector and Appraiser weekly; such a system would bring continually the desired aid in the verification of the values specified in the Invoice, and save the merchant the annoyance and often advance of a large sum unnecessarily taken from him, and held by Government sometimes for months.

This would greatly relieve also the necessity of

REFUNDING,

which was referred to, with evidence, in official document entitled—

"CUSTOMS' DUTIES REFUNDED,"

in the preliminary argument before the Commission, pages 1679 and 1680.

TRANSITION.

In the matter of revision there will be found, particularly, a new Schedule. Under Sundries, Schedule M, there is, at present, a most conglomerate and ridiculous mixture of Chemicals and Animals, Drugs and Food, Muskets and Malt, Diamonds and Oil, &c.

There is no Industry that embraces more articles than that of Chemicals.

It has been a desire, long before entering upon this work, to separate these articles from such a heterogeneous mass as at present; hence the following revision is submitted for your approval:

Schedule M,
Chemicals and Drugs,
and
Schedule N,
Sundries.

Schedules E and F have also been revised, viz:

Metals and Minerals,
and Breadstuff, Provisions, and Animals,

as seeming most proper and appropriate, and many other articles have been likewise transferred.

SCHEDULES.

SCHEDULE A.

COTTON GOODS.

It is earnestly recommended in this Schedule to make a simplification of rates by the abolition of the duplex system, viz, additional ad-valorem rates.

The objections to this complicated system come from all sides and from all parts of our country.

To show the public opinion in antipathy to this double duty, the following expression, from one of the most earnest friends of Industry in Congress, is cited.

Senator Morgan, of Alabama, said:

One of the most hurtful defects in the existing tariff is that it imposes both ad-valorem and specific duties, at rates purely arbitrary, upon a great number and variety of articles.

Complaint is made from every quarter against this feature of the present system, and this fact may lead us, or force us, as I hope it will, into a general and speedy revision of the tariff.

No single interest in the country is satisfied with the tariff in all respects.

This concession, if made, will tend to disarm all honest complainants, and exhibit not only a spirit of generosity, but also contribute greatly to the simplification of our Tariff without injury to the Industry.

The Schedule covers an Industry second in perfection and prosperity of all the Industries of our country. It is beyond dependence, for its product is unexcelled in the world.*

It is a reasonable concession, as will be seen, and abolishes the duplex system.

SCHEDULE B.

EARTHS AND EARTHENWARES.

Under this Schedule there are several Industries embraced; but there has been a remarkable evidence of unanimity in the opinion that the protection of the raw material entering into each Industry has unques-

* See Appendix, same heading.

tionably decreased its price. For instance, in China Clay, or Kaolin, which enters into the manufacture of Pottery, China, Encaustic Tiles, and Ultramarines, &c., the price has decreased gradually, and benefited not only the manufacturers of these industries, but also the public generally.

In view of this fact, so forcibly illustrated in the experience and testimony of these purchasing parties, it seems the more remarkable, in the reports of testimony before the Tariff Commission, only last Saturday, at Philadelphia, an appeal in favor of abolishing the rate upon this article made by Professor Sumner, who is doubtless not aware that—

The price that Kaolin, or China clay, brought in England was	\$1 28 per foot.
And is now reduced by the home competition with the English article to	0 40 per foot.

Follow the theoretical idea of removing the duty therefrom, and in two months our manufacturers will be required to pay again, when the home supply is short, \$1.28 per foot, or perhaps more.

The contrast here presented is so astonishing, not as an argument for the system of Free Trade or Protection, but in view of the dissemination of fallacy so prejudicial to the development of our natural resources, national interests, and our Industrial savings, that it is necessary to call it to your attention to-day, in the presence of these gentlemen, who are buyers from abroad of the one crude material, China Clay, for example, and who have hundreds of thousands of dollars at stake against the chimerical doctrines of one who burns the midnight oil, not in practical Industry, but over the time-honored but now dead literature of Adam Smith, Say, Ricardo, and Bastiat.

Does it not argue a sad prospect for the economic training of our youth, whose growing thoughts are being educated to such illogical argument and denied the benefit in early life of broad-minded judgment and common-sense principles?

In this Schedule there has been reduction and increase, according to necessity; but the average will remain about the same as at present, viz, 43 per cent. There is appended hereto a communication setting forth the conditions of this Industry to which your attention is called for further consideration. (See Appendix.)

SCHEDULE C.

HEMP, JUTE, AND FLAX.

In this Industry so important to Agriculture as well as Manufacture, the rates, happily harmonized in Convention, have been made by one accord the rates of the League.

The increased rate proposed is absolutely essential to save the invested capital and continue this great Industry, which has been too long neglected.

It is submitted as an increase of about 10 per cent. on the total sum or value of imports under this Schedule.

It is shown in the Appendix that a vast quantity of flax is now carelessly destroyed in our country; and, in contrast thereto, your attention is called to the impoverishment thereof in Germany, and the necessary repeal of duty thereupon.

[Translation.]

AN ACT in relation to an amendment of the customs tariff of the German customs territory. Approved June 6, 1880.

We, William, by the grace of God German Emperor, King of Prussia, &c., do ordain in the name of the empire, by and with the consent of the Federal Council and the Diet, as follows, viz:

SOLE SECTION. The customs tariff provided for by the act in relation to the customs tariff of the German customs territory and the revenues derived from customs and taxes on tobacco, approved July 15, 1879 (Imperial Bulletin of Laws, p. 207), is hereby amended as follows:

No. 8. "Flax and other vegetable materials for spinning, with the exception of cotton, raw, dried, broken, or hackled, or as waste—free."

The clause added to No. 22 a of the customs tariff, which reads: "Jute, manila, hemp, cocoa-fiber, raw, dried, broken, or hackled—free," is hereby repealed.

In witness our own imperial hand and the imperial seal thereto affixed.

Done at Berlin the 6th day of June, 1880.

[L. S.]

WILHELM.
BISMARCK.

SCHEDULE D.

LIQUORS AND WINES.

In this Schedule the League make no change except for the protection of American Wines and Brandies and protection against foreign adulteration.

SCHEDULE E.

METALS AND MINERALS.

With the exceptional changes specified, the League have found the rates determined upon at the Oresson Springs Convention the most harmonious to their body, and most earnestly recommend the reclassification and phraseology as presented to your body by the American Iron and Steel Association.

Upon Iron Ore, however, it is earnestly submitted, with arguments in Appendix, that a duty of \$2 per ton be placed, and the special attention of your honorable body is invited hereto.

SCHEDULE F.

BREADSTUFFS, PROVISIONS, AND ANIMALS.

The addition of Animals under this Schedule, as more appropriate, is asked, and an increased duty on Rice, Barley, and English biscuit. The remainder stands intact, at the request of the Produce Exchange, New York. (See Appendix, under the same heading.)

SCHEDULE G.

SUGARS.

The importance of this Schedule is seen in the enormous returns of Revenue, yielding a national income of nearly \$50,000,000. The abolition of the duplex rates is strongly urged, and specific rates given.

That Sugar should have sufficient protection is unquestionable, especially in view of the prospect of the future and certain development of the Beet-Root Sugar Industry, which is very certain also to attract the interest of the East and West, an evidence of which will be found in the argument under Appendix.

The State Law of New Jersey now includes a section granting a bounty in encouragement of its cultivation, which is producing good results, viz:

"An act to encourage the manufacture of sugar in the State of New Jersey," which offers a bounty of \$1⁰⁰ for every ton (of 2,000 pounds) of beets, sorghum, amber, or other sugar-cane raised by any farmer in the State and manufactured into sugar in the State." The act also provides, "That the sum of one cent per pound upon all merchantable sugar made within the State, from beets, sorghum, amber, or other sugar-cane grown within the State, shall be paid by the treasurer of the State to any person or persons who shall establish a plant or sugar manufactory within the State, and shall manufacture sugar from beets, sorghum, amber, or other cane raised in the State," &c.

SCHEDULE H.

SILKS AND SILK GOODS.

In this Industry there is a disposition to a slight reduction, but also a counter-element desiring the present rates to remain *in statu quo*; hence the average given as the proposed rate in Digest is considered most likely to harmonize the extremes.

The remarkable development within the last few years of the cultivation of the Silk Worm in the South has opened a new Industry in that locality, as a companion to the new Industry of the Sugar Beet in the East and West. It is known to be the intention of Southern Senators to introduce a protective clause for the cultivation of the worm, and for reeled silk; it is therefore recommended to place upon this Schedule a rate of 10 per cent. for raw and reeled silk, and it is hoped that the Southern States will follow the example of the North, and indeed the South in early days of cotton, and enact a bounty-law, similar to that for the encouragement of the Beet-Root Sugar Industry, for the development of so important a product.

It is most opportune to give the views of the Agricultural Department, as prepared by Professor Riley, and appended, page 107.

As much as \$200,000 to \$300,000 worth of cocoons at a time are shipped across our continent from China to France, to enable the latter country to reap the profit of re-exporting here in made-up goods.

SCHEDULE I.

SPICES.

Slight changes are found to be desired, but the small quantity entering into retail business renders the change hardly perceptible.

SCHEDULE J.

TOBACCO.

Remains intact. Suggested changes recommended by the League regarding tobacco pertain to Internal Revenue. See pages 1762, 1763.

SCHEDULE K.

WOODS.

The transition of several articles from Sundries to this Schedule is recommended, especial attention is asked for the argument given in Appendix for the protection of our timber by admitting free a consumption from Canada while our young forests are growing.

SCHEDULE L.

WOOL AND WOOLENS.

To this Schedule the League has given especial care, and received that advice that can only come from practical experience and sound judgment.

The conditions of this Industry are clearly set forth in a communication to the League—see Appendix. In this paper it will be seen that we are capable of producing nearly all the wools needed for our home consumption, and the demand for those peculiar wools not produced in the United States is not sufficiently great to cause us inconvenience.

“If any special kind of clothing or combing wools cannot be raised here it is either very unimportant or a substitute for it may be found among our own wools.” The changes made in the rates of the Schedule are equitable and reasonable, and the League thinks will claim the acceptance of all disposed to a mutual adjustment and improvement of our Tariff law.

SCHEDULE M.

CHEMICALS AND DRUGS.

The present disorder and conglomerate mass of all kinds of articles under this Schedule has been permitted too long, and it is earnestly recommended to improve this condition by making this Schedule of “Chemicals and Drugs” only. Under these heads come many of our most important articles, and the revision thereof is essential.

Many enumerated articles are now obsolete, and many new ones have taken their places, which are specified in Digest, pages 62–68.

Under this Schedule there are several articles to which the League beg the careful consideration of your honorable body, which are set forth in detail and submitted with especial request for your consideration.

QUININE.

There is no article entering the Chemical Industry of greater importance or of more universal interest than quinine, and the more generally its full conditions are known the greater benefit will be derived from it by our people generally.

The misunderstanding of the influences affecting this article and the trade of the bark, as well as the manufacture and sale of the Quinine salts, is so great that it is very necessary to present to the public in the true light the injury done to themselves by the abolition of the tariff rate.

No more unbiased expression could be given concisely, than the following extract from the Monthly Reports of the Department of State, No. 6, April, 1881, page 632:

Quinine.—Whether the admission of this article free of duty is advantageous to the people of the United States is a question for careful study. Consul Randall, of Sabanailla, writes as follows:

"In the late consul's report you see what he says will be the result on the trade in quinia bark, and how the reduction would affect the movement of the article to the States. You will appreciate the accuracy of this prediction by comparing the following statement:

	Bales,
"Peruvian bark shipped to New York in 1879	33,560
"Peruvian bark shipped to New York in 1880	19,794
	<hr/>
'Decrease in bales shipped	13,766
'Decrease in value shipped	\$688,300

"This represents the raw material, which would be augmented greatly before reaching the consumer in merchantable form. The loss of this trade will be more seriously felt in the future, as new quinia fields have recently been discovered and a very large amount of capital invested to develop the business. The output next year will undoubtedly be increased to a very large amount, and will find its market in Europe, there manufactured, and consumed in the United States. This is the direct result of the free-trade success on this item of the United States tariff. Fortunately the loss in the quinia trade is more than balanced by increased production, and the introduction and corresponding increased activity caused by the competition of foreign capital."

In order also to exhibit to your honorable body the disadvantages operating against this Industry in our country, the following statement is submitted herewith:

Statement of the discrimination against American quinine, with bark averaging 10 ounces to the 100 pounds.

	Per cent.
Cost of bark	70
Cost of solvents, alkali, &c., dutiable	12
Cost of wages	12
Interest on plant, wear and tear of same	6
	<hr/>
	100
The taxes and duties upon solvents (alkali, &c.), increase the manufacturing cost more than 40 per cent., say	\$4 80
Increased cost of wages over those of Europe, probably 50 per cent., say 25 per cent	3 00
Increased cost of plant, say 30 per cent	1 80
	<hr/>
	9 60

About 10 per cent. upon the whole manufacturing cost, so that manufacturers in the United States cannot produce quinine from the bark within 10 per cent. of the cost incurred by European manufacturers.

In consideration, therefore, of these facts and conditions, the League deems it proper to respectfully urge upon your attention for favorable action a duty of 10 per cent. thereon, believing that the country will, on being advised of these facts, approve your judgment.

This is one of the absurdities of our Tariff which should be immediately corrected, wherein a tax is laid on the raw material while the manufactured article is admitted free.

CASTOR OIL.

In respect to this most important Drug and its manufacture the League would ask particular consideration.

Its conditions are these, viz:

East India is the great foreign seat of this manufacture, and the disadvantages of its manufacture in this country are great.

Labor there is from 9 to 18 cents per day;

here from \$1.75 to \$2, ordinary hand per day;

and \$5 to \$8 for head men per day,

showing a disadvantage of 1500 per cent.

Until recently this important article was made and imported from East Indies exclusively.

Its fresh condition is very necessary to the public, and the importance of home manufacture is therefore unquestionable.

The capital invested in the plant for this manufacture in this country is some \$850,000.

The League earnestly petitions that due protection be retained for this outlay and for this most valuable and new Industry in our country.

Its manufacturers are ready to concede a reduction of 40 cents of the present rate, viz, \$1 per gallon, and accept 60 cents in concession to the general desire to cut down all rates of the Tariff where possible.

It is not possible, however, for this Industry to stand with a less rate than 60 cents per gallon; the business would be entirely destroyed, and is presented in a forcible manner in a letter thereupon—see Appendix, to which your attention is asked for information in detail, and from which the following is taken.

Without the rate of protection above stated the communication says:

The business would be entirely destroyed and the factories and machinery rendered worthless by reason of the superior facilities which foreign manufacturers of Castor Oil enjoy, and which would enable them to deliver their Oil in this country at a price which would drive the American Oil from the market, and ruin the domestic industry.

Should this be the case, and the American public be made again the dependents upon a foreign article, it is hardly necessary to point out the picture of all such analogous cases; the price of the foreign article would at once advance from a monopoly in trade, and cost more than it does now. The figures and proof bearing especially upon this article are clearly and completely set forth in the paper referred to above.

SCHEDULE N.

SUNDRIES.

Under this head the League has endeavored to leave all articles that cannot properly be placed under the preceding Schedules. This will necessarily change the order of the Paragraphs, but will not affect the order alphabetically. Such changes will be recognized by the interruption of the serial number. Particular attention is also urgently requested to arguments prepared and added in Appendix to substantiate the revision made by the League in the following Digest.

CONCLUSION.

In conclusion, the League desires that it may be considered that where no change has been suggested no change has been deemed wise, unless reasons exist unknown at present. This revision is submitted with expressions of sincere interest and watchful anxiety for the result of your responsible and trying duties, believing that whatever changes you may in your conclusions present before the statesmen that control the destiny of our conditions in personal and national relations to our Industries, your recommendations will greatly contribute to the revision of our economic laws, and it is with sanguine hope that such results are anticipated.

SYNOPSIS OF REVISION.

The following is a synopsis of the League's revision:

SCHEDULES.

- A. A rational reduction and abolition of the duplex system.
- B. Increase and decrease.
- C. An increase essential, and recommended.
- D. Protection to American Wines. See also Internal Revenue.
- E. Material changes. Protection to Iron Ore.
- F. Slight modification.
- G. Simplifications. Same average rates.
- H. Protection to Silk culture and reeling.
 - I. Revised.
 - J. See Internal Revenue.
- K. Protection to—by abolishing duty on—Lumber.
- L. Simplification and consistent revision.
- M. Chemicals exclusively, thoroughly revised.
- N. New Schedule, Sundries. Transfer of articles.

FREE LIST.

Articles added:

Acid, Tannic.	Hatters' plush.
Arrowroot.	Iodine, salts of.
Asphaltum.	Lead, nitrate of.
Assafœtida.	Oil, bay or laurel.
Balsams (all).	Paraffine.
Barytes, nitrate of.	Parchment.
Beeswax.	Pitch.
Bladders, manufactures.	Resin and rosin.
Bronze Powder.	Saltpetre, crude.
Cobalt, oxide of.	Smalts.
Drugs, medicinal, crude, not otherwise provided for.	Sponges.
Fusel oil.	Turpentine, spirits of.
Hair pencils.	Watch Jewels.

INTERNAL REVENUE.

Material changes recommended; abolition of tax upon most of the items at present specified.

SHIPPING.

The revival of our Merchant Marine is earnestly recommended as necessary for the protection of American trade-marks, the purity of American products, and the preservation of American honor.

In our industries at home as well as in our credit abroad there is no source of personal employment and national pride so great as ship-building. Let Congress properly give subvention to our Mail Transports, and the demand for American built ships will immediately prove the fallacy and absurdity of the imputation that "Americans cannot build ships," and the foolish assertion that a tariff on 5 per cent. of the ship's cost—crude material—could affect the conditions of our shipping community.

A TARIFF TRIBUNAL.

An equitable court, composed of the United States Commissioner of Customs, a representative selected from merchants or manufacturers, and a third arbitrator selected by both, similar to the provision of the Tariff law of France (see Appendix), is earnestly recommended.

*DIGEST OF THE TARIFF REVISION, LAWS, SCHEDULES, AND RATES OF
THE UNITED STATES.*

PREPARED AND PROPOSED BY

THE METROPOLITAN INDUSTRIAL LEAGUE.

[Revised Statutes. Title XXXIII.—Import Duties.]

LAWS.

OBSCENE ARTICLES—PROHIBITED FROM IMPORTATION.

SECTION 2491. All persons are prohibited from importing into the United States, from any foreign country, any obscene book, pamphlet, paper, writing, advertisement, circular, print, picture, drawing, or other representation, figure, or image on or of paper or other material, or any cast, instrument, or other article of an immoral nature, or any drug or medicine, or any article whatever, for the prevention of conception, or for causing unlawful abortion. No invoice or package whatever, or any part of one, in which any such articles are contained shall be admitted to entry; and all invoices and packages whereof any such articles shall compose a part are liable to be proceeded against, seized, and forfeited by due course of law. All such prohibited articles in the course of importation shall be detained by the officer of customs, and proceedings taken against the same as prescribed in the following section: *Provided*, That the drugs hereinbefore mentioned, when imported in bulk and not put up for any of the purposes hereinbefore specified, are excepted from the operation of this section. [See Section 1785.]

MODE OF PROCEDURE.

Sec. 2492. Any judge of any district or circuit court of the United States, within the proper district, before whom complaint in writing of any violation of the preceding section is made, to the satisfaction of such judge, and founded on knowledge or belief, and, if upon belief, setting forth the grounds of such belief, and supported by oath or affirmation of the complainant, may issue, conformably to the Constitution, a warrant directed to the marshal, or any deputy marshal, in the proper district, directing him to search for, seize, and take possession of any such article or thing hereinbefore mentioned, and to make due and immediate return thereof, to the end that the same may be condemned and destroyed by proceedings, which shall be conducted in the same manner as other proceedings in case of municipal seizure, and with the same right of appeal or writ of error.

NEAT CATTLE.

Sec. 2493. The importation of neat cattle and the hides of neat cattle from any foreign country into the United States is prohibited: *Provided*, That the operation of this section shall be suspended as to any foreign country or countries, or any parts of such country or countries, whenever the Secretary of the Treasury shall officially determine, and give public notice thereof, that such importation will not tend to the introduction or spread of contagious or infectious diseases among the cattle of the United States; and the Secretary of the Treasury is hereby authorized and empowered, and it shall be his duty, to make all necessary orders and regulations to carry this law into effect, or to suspend the same as therein provided, and to send copies thereof to the proper officers in the United States, and to such officers or agents of the United States in foreign countries as he shall judge necessary.

NEAT CATTLE—WHEN PERMITTED.

Sec. 2494. The President of the United States, whenever in his judgment the importation of neat cattle and the hides of neat cattle may be made without danger of the introduction or spread of contagious or infectious disease among the cattle of the United States, may, by proclamation, declare the provisions of the preceding section to be inoperative, and the same shall be afterward inoperative and of no effect from and after thirty days from the date of said proclamation.

NEAT CATTLE—PENALTY.

SEC. 2495. Any person convicted of a willful violation of any of the provisions of the two preceding sections *shall be fined not exceeding \$500, or imprisoned not exceeding one year, or both, in the discretion of the court.*

WATCH MOVEMENTS; SIMULATED—PROHIBITION OF.

SEC. 2496. No watches, watch-cases, watch-movements, or parts of watch-movements, of foreign manufacture, which shall copy or simulate the name or trade-mark of any domestic manufacturer, shall be admitted to entry at the custom-houses of the United States, unless such domestic manufacturer is the importer of the same. And in order to aid the officers of the customs in enforcing this prohibition, any domestic manufacturer of watches who has adopted trade-marks may require his name and residence and a description of his trade-marks to be recorded in books which shall be kept for that purpose in the Department of the Treasury, under such regulations as the Secretary of the Treasury shall prescribe, and may furnish to the department facsimiles of such trade-marks; and thereupon the Secretary of the Treasury shall cause one or more copies of the same to be transmitted to each collector or other proper officer of the customs.

GOODS IN FOREIGN VESSELS—AGAINST IMPORTATION.

SEC. 2497. No goods, wares, or merchandise, *unless in cases provided for by treaty,* shall be imported into the United States from any foreign port or place, except in vessels of the United States, or in such foreign vessels as truly and wholly belong to the citizens or subjects of that country of which the goods are the growth, production, or manufacture; or from which such goods, wares, or merchandise can only be, or most usually are, first shipped for transportation. All goods, wares, or merchandise imported contrary to this section, and the vessel wherein the same shall be imported, together with her cargo, tackle, apparel, and furniture, shall be forfeited to the United States; and such goods, wares, or merchandise, ship or vessel, and cargo shall be liable to be seized, prosecuted, and condemned, in like manner, and under the same regulations, restrictions, and provisions as have been heretofore established for the recovery, collection, distribution, and remission of forfeitures to the United States by the several revenue laws.

SPECIFICATION OF THE ABOVE.

SEC. 2498. The preceding section shall not apply to vessels, or goods, wares, or merchandise, imported in vessels of a foreign nation which does not maintain a similar regulation against vessels of the United States.

ARTICLES RESEMBLING THOSE ENUMERATED, AND MANUFACTURED FROM TWO OR MORE MATERIALS.

SEC. 2499. There shall be levied, collected, and paid, on each and every non-enumerated article which bears a similitude, either in material, quality, texture, or the use to which it may be applied, to any article enumerated in this title, as chargeable with duty, the same rate of duty which is levied and charged on the enumerated article which it most resembles in any of the particulars before mentioned; and if any non-enumerated article equally resembles two or more enumerated articles, on which different rates of duty are chargeable, there shall be levied, collected, and paid, on such non-enumerated article, *the same rate of duty as is chargeable on the article which it resembles paying the highest duty;* and on all articles manufactured from two or more materials, the duty shall be assessed at the highest rates at which any of its component parts may be chargeable.

GOODS REIMPORTED.

SEC. 2500. Upon the reimportation of articles once exported, of the growth, product, or manufacture of the United States, upon which no internal tax has been assessed or paid, or upon which such tax has been paid and refunded by allowance or drawback, there shall be levied, collected, and paid a *duty equal to the tax imposed by the internal-revenue laws upon such articles.*

GOODS OF COUNTRIES EAST OF THE CAPE OF GOOD HOPE, BUT IMPORTED DIRECT FROM PLACES WEST THEREOF.*

SEC. 2501. There shall be levied, collected, and paid on all goods, wares, and merchandise, of the growth or produce of the countries east of the Cape of Good Hope (except wool, raw cotton, and raw silk, as reeled from the cocoon, or not further advanced than tram, thrown, or organzino), when imported from places west of the Cape of Good Hope, a duty of 10 *per centum ad valorem* in addition to the duties imposed on any such article when imported directly from the place or places of their growth or production.

GOODS IMPORTED ON FOREIGN VESSELS.

SEC. 2502. A discriminating duty of 10 *per centum ad valorem*, in addition to the duties imposed by law, shall be levied, collected, and paid on all goods, wares, and merchandise which shall be imported on vessels not of the United States; but this discriminating duty shall not apply to goods, wares, and merchandise which shall be imported in vessels not of the United States, entitled, by treaty or any act of Congress, to be entered in the ports of the United States on payment of the same duties as shall then be paid on goods, wares, and merchandise imported in vessels of the United States.

SCHEDULES.

SPECIAL RATES OF DUTY.

SEC. 2503. There shall be levied, collected, and paid upon all articles mentioned in the schedules contained in the next section, imported from foreign countries, the rates of duty which are by the schedules respectively prescribed.

* To be restored, as necessary to the protection of American shipping in *direct* trade. Its elimination from the statutes at the last session of Congress was a great outrage to American interests.

SCHEDULE A.
COTTON GOODS.

1714

TARIFF COMMISSION.

[INT. INDUSTRIAL LEAGUE.]

Present paragraph No.	Specification.	Unit of quantity.	Present rate of duty.		Rate of duty proposed by the League.	
			Specific.	Ad valorem.	Specific.	Ad valorem.
1	Sec. 2504. On all manufactures of cotton (except jeans, denims, drillings, bed-tickings, gingham, plaids, cottonades, pantaloon stuff, and goods of like description) not bleached, colored, stained, painted, or printed, and not exceeding one hundred threads to the square inch, counting the warp and filling, and exceeding in weight five ounces per square yard.	Per square yard.	\$0 05	<i>Per cent.</i>		<i>Per cent.</i>
	If bleached	do	05½	} and 10	}	35
	If colored, stained, painted, or printed	do	05½			40
2	On finer and lighter goods of like description, not exceeding two hundred threads to the square inch, counting the warp and filling, unbleached.	do	05	} and 20	}	45
	If bleached	do	05½			50
	If colored, stained, painted, or printed	do	05½			
3	On goods of like description, exceeding two hundred threads to the square inch, counting the warp and filling, unbleached.	do	05	} and 20	}	45
	If bleached	do	05½			50
	If colored, stained, painted, or printed	do	05½			
4	On cotton jeans, denims, drillings, bed-tickings, gingham, plaids, cottonades, pantaloon stuffs, and goods of like description, or for similar use, if unbleached, and not exceeding one hundred threads to the square inch, counting the warp and filling, and exceeding five ounces to the square yard.	do	06	} and 10	}	35
	If bleached	do	06½			40
	If colored, stained, painted, or printed	do	06½			
5	On finer or lighter goods of like description, not exceeding two hundred threads to the square inch, counting the warp and filling, if unbleached.	do	06	} and 15	}	40
	If bleached	do	06½			45
	If colored, stained, painted, or printed	do	06½			
6	On goods of lighter description, exceeding two hundred threads to the square inch, counting the warp and filling, if unbleached.	do	07	} and 15	}	40
	If bleached	do	07½			45
	If colored, stained, painted, or printed	do	07½			
	And, in addition thereto, fifteen per centum ad valorem: <i>Provided</i> , That upon all plain woven cotton goods, not included in the foregoing schedule, unbleached, valued at over sixteen cents per square yard; bleached, valued at over twenty cents per square yard; colored, valued at over twenty-five cents per square yard, and cotton jeans, denims, and drillings, unbleached, valued at over twenty cents per square yard, and all				35	35

<p>other cotton goods of every description, the value of which shall exceed twenty-five cents per square yard, there shall be levied, collected, and paid a duty of. <i>And provided further,</i> That no cotton goods having more than two hundred threads to the square inch, counting the warp and filling, shall be admitted to a less rate of duty than is provided for goods which are of that number of threads 35.</p>						
7	Cotton thread, yarn, warps, or warp-yarn, not wound upon spools, whether single or advanced beyond the condition of single by twisting two or more single yarns together, whether on beams or in bundles, skeins, or cops, or in any other form, valued at not exceeding forty cents per pound.	Per pound	10	} and 20 {	45	
	Valued at over forty cents per pound and not exceeding sixty cents per pound	do	20			50
	Valued at over sixty cents per pound and not exceeding eighty cents per pound	do	30			55
	Valued at over eighty cents per pound	do	40			50
8	Spool-thread of cotton, containing on each spool not exceeding one hundred yards of thread	Per dozen	06	} and 30 and 35 {	60	
	Exceeding one hundred yards for every additional hundred yards of thread on each spool or fractional part thereof, in excess of one hundred yards.	do	06			60
9	Cotton cords, gimps, and galloons and cotton laces, colored			35	35	
10	Cotton shirts and drawers, woven or made on frames, and on all cotton hosiery			35	35	
11	Cotton velvet			35	35	
12	Cotton braids, insertings, lace, trimming, or bobbinet, and all other manufactures of cotton, not otherwise provided for.			35	35	

SCHEDULE B.
EARTHS AND EARTHENWARES.

1716

TARIFF COMMISSION.

[MET. INDUSTRIAL TRADES.]

Present para- graph U. S.	Specification.	Unit of quantity.	Present rate of duty.		Rate of duty proposed by the League.	
			Specific.	Ad valo- rem.	Specific.	Ad valo- rem.
13	Brown earthenware and common stoneware, gas retorts, stoneware not ornamented			<i>Per cent.</i> 25		<i>Per cent.</i> 25
14	China, porcelain, and parian ware, gilded, ornamented, or decorated in any manner			50		60
15	China, porcelain, and parian ware, plain white, and not decorated in any manner. On all other earthen, stone, or crockery ware, white, glazed, edged, printed, painted, dipped, or cream-colored, composed of earthy or mineral substances, and not otherwise provided for.			45		45
				40		40
16	Stoneware above the capacity of ten gallons			20		20
	[Spurs and stilts used in the manufacture of earthen, stone, or crockery ware, free of duty.]					
17	Slates, slate-pencils, slate chimney-pieces, mantels, slabs for tables, and all other manufactures of slate			40		40
		Roofing slates		35		35
18	Unwrought clay, pipe-clay, fire-clay	Per ton	5 00		\$2 50	
19	Kaoline	do	5 00		3 50	
20	On fullers' earth	do	3 00		3 00

[INT. INDUSTRIAL LEAGUE.]

Present para- graph R. S.	Specification.	Unit of quantity.	Present rate of duty.		Rate of duty proposed by the League.	
			Specific.	Ad valo-rem.	Specific.	Ad valo-rem.
58	Wines imported in casks, containing not more than twenty-two per centum of alcohol, and valued at not exceeding forty cents per gallon.	Per gallon	\$0 25	} <i>Per cent.</i> and 25	\$0 50	} <i>Per cent.</i>
	Valued at over forty cents, and not over one dollar per gallon	do	60		75	
	Valued at over one dollar per gallon	do	1 00		1 00	
	On all still wines imported in casks	do	40		50	
59	Wines of all kinds, imported in bottles, and not otherwise provided for: the same rate per gallon as wines imported in casks. <i>But all bottles containing one quart, or less than one quart and more than one pint, shall be held to contain one quart, and all bottles containing one pint or less shall be held to contain one pint, and shall pay in addition for each bottle.</i>	Per bottle	03		05	
	<i>[a. On all still wines imported in bottles, per case of one dozen bottles.</i>	Per case	1 60		1 60	
	<i>Containing each not more than one quart and more than one pint, or twenty-four bottles, containing each not more than one pint; and any excess beyond those quantities found in such bottles shall be subject to a duty of five cents per pint or fractional part thereof.</i>	Per pint	05		05	
	<i>But no separate or additional duty shall be collected on the bottles: Provided, That any wines imported containing more than twenty-four per centum of alcohol shall be forfeited to the United States: Provided also, That there shall be an allowance of five per centum and no more, on all effervescing wines, liquors, cordials, and distilled spirits in bottles, to be deducted from the invoice quantity in lieu of breakage.</i>					
60	<i>SEC. 3. That all imported wines of the character provided for in the preceding section which may remain in public store or bonded warehouse on the day this act shall take effect shall be subject to no other duty upon the withdrawal thereof or consumption than if the same were imported after that day: Provided, That any such wines remaining on shipboard within the limits of any port of entry in the United States on the day aforesaid, duties unpaid, shall, for the purposes of this section, be considered as constructively in public store or bonded warehouse. Act of February 8, 1875.]</i>					
	Champagne and all other sparkling wines, in bottles, containing each not more than one quart and more than one pint.	Per dozen	6 00		6 00	
	Containing not more than one pint each, and more than one-half pint	do	3 00		3 00	
	Containing one-half pint each, or less	do	1 50		1 50	
	And in bottles containing more than one quart each, shall pay, in addition to six dollars per dozen bottles, at the rate, on the quantity in excess of one quart per bottle of.	Per gallon	2 00		2 00	
	But any liquors containing more than twenty-two per centum of alcohol, which shall be entered under the name of wine, shall be forfeited to the United States. And wines, brandy, and other spirituous liquors imported in bottles shall be packed in packages containing not less than one dozen bottles in each package; and all such bottles shall pay an additional duty of.	Per bottle	03		05	
No allowance shall be made for breakage unless such breakage is actually ascertained by count and certified by a custom-house appraiser.	See ¶ 59					

61	Brandy and other spirits manufactured or distilled from grain or other materials, and not otherwise provided for. <i>Each and every gauge or wine-gallon of measurement shall be counted as at least one proof-gallon; and the standard for determining the proof of brandy and other spirits, and of wine or liquors of any kind imported, shall be the same as that which is defined in the laws relating to internal revenue.</i> But any brandy or other spirituous liquors imported in casks of less capacity than fourteen gallons shall be forfeited to the United States.	Per proof-gallon.	2 00	2 00
62	On all compounds or preparations of which distilled spirits is a component part of chief value, there shall be levied a duty not less than that imposed upon distilled spirits.	See above.		
63	Cordials, liqueurs, arrack, absinthe, kirschwasser, ratafia, and other similar spirituous beverages, or bitters containing spirits, and not otherwise provided for.	Per proof-gallon.	2 00	2 00
64	No lower rate or amount of duty shall be levied, collected, and paid, on brandy, spirits, and other spirituous beverages, than that fixed by law for the description of first proof, but it shall be increased in proportion for any greater strength than the strength of first proof; and no brandy, spirits, or other spirituous beverages under first proof shall pay a less rate of duty than. And all imitations of brandy, or spirits, or of wines imported by any names whatever, shall be subject to the highest rate of duty provided for the genuine articles respectively intended to be represented, and in no case less than.	Per gallon	1 00	1 50
65	Ale, porter, and beer, in bottles	do		35
	Otherwise than in bottles	do		20
66	Vermuth: the same duty as on wines of the same cost.	See ¶ 59

SCHEDULE L.
WOOL AND WOOLEN GOODS.*

Present para- graph U. S.	Specification.	Unit of quantity.	Present rate of duty.		Rate of duty proposed by the League.	
			Specific.	Ad valo-rem.	Specific.	Ad valo-rem.
229	All wools, hair of the alpaca, goat, and other like animals, shall be divided for the purpose of fixing the duties to be charged thereon into the three following classes: CLASS 1.—CLOTHING WOOL.					
230	That is to say, merino, mestiza, metz or metia wools, or other wools of merino blood, immediate or remote; down clothing wools, and wools of like character with any of the preceding, including such as have been heretofore usually imported into the United States from Buenos Ayres, New Zealand, Australia, Cape of Good Hope, Russia, Great Britain, Canada, and elsewhere, and also including all wools not hereinafter described or designated in classes two and three. CLASS 2.—COMBING WOOLS.					
231	That is to say, Leicester, Cotswold, Lincolnshire, down combing wools, Canada long wools, or other like combing wools of English blood, and usually known by the terms herein used; and also all hair of the alpaca, goat, and other like animals. CLASS 3.—CARPET WOOLS AND OTHER SIMILAR WOOLS.					
232	Such as Donskoi, native South American, Cordova, Valparaiso, native Smyrna, and including all such wools of like character as have been heretofore usually imported into the United States from Turkey, Greece, Egypt, Syria, and elsewhere. The duty upon wool of the first class which shall be imported <i>washed</i> , shall be <i>twice the amount of the duty</i> to which it would be subjected if imported unwashed.					
233	And the duty upon wool of all classes which shall be imported <i>scoured</i> shall be <i>three times</i> the duty to which it would be subject if imported unwashed. And the duty upon wool of the sheep; or hair of the alpaca, goat, and other like animals, which shall be imported in any other than the ordinary condition as now and heretofore practiced, or which shall be <i>changed</i> in its character or condition, <i>for the purpose of evading the duty</i> , or which shall be reduced in value by the admixture of dirt, or any other foreign substance, shall be <i>twice the duty</i> to which it would be otherwise subject.					
234	Wools of the first class, the value whereof at the last port or place whence exported to the United States, excluding charges in such port, shall be thirty-two cents or less per pound. Wools of the same class, the value whereof at the last port or place whence exported to the United States, excluding charges in such port, shall exceed thirty-two cents per pound.	Per pound	\$0 10	and 11	40
	do	12	and 10	40

* The rates proposed herewith by the League for woollen manufactures are based upon the rates likewise proposed for wools.

Wearing apparel in actual use, and other personal effects (no merchandise), professional books, implements, instruments, and tools, trade, occupation, or employment of persons arriving in the United States. But this exception shall not be construed to include machinery or other articles imported for use in any manufacturing establishment or for sale.	
880. Whalebone, unmanufactured.	

FISH OIL AND FISH OF CANADA, PRINCE EDWARD ISLAND, AND NEWFOUNDLAND—
WHEN FREE.

SEC. 2506. Whenever the President of the United States shall receive satisfactory evidence that the Imperial Parliament of Great Britain, the Parliament of Canada, and the legislature of Prince Edward Island have passed laws on their part to give full effect to the provisions of the treaty between the United States and Great Britain, signed at the city of Washington on the eighth day of May, eighteen hundred and seventy-one, as contained in articles eighteenth to twenty-fifth, inclusive, and article thirtieth of said treaty, he is hereby authorized to issue his proclamation declaring that he has such evidence, and thereupon, from the date of such proclamation, and so long as the said articles eighteenth to twenty-fifth, inclusive, and article thirtieth of said treaty shall remain in force, according to the terms and conditions of article thirty-third of said treaty, all fish-oil and fish of all kinds (except fish of the inland lakes and of the rivers falling into them, and except fish preserved in oil), being the produce of the fisheries of the Dominion of Canada or of Prince Edward's Island, shall be admitted into the United States free of duty; and whenever the colony of Newfoundland shall give its consent to the application of the stipulations and provisions of the said articles eighteenth to twenty-fifth of said treaty, inclusive, to that colony, and the legislature thereof and the Imperial Parliament shall pass the necessary laws for that purpose, the above-enumerated articles, being the produce of the fisheries of the colony of Newfoundland, shall be admitted into the United States free of duty, from and after the date of a proclamation by the President of the United States, declaring that he has satisfactory evidence that the said colony of Newfoundland has consented, in a due and proper manner, to have the provisions of the said articles eighteenth to twenty-fifth, inclusive, of the said treaty extended to it, and to allow the United States the full benefits of all the stipulations therein contained, and shall be so admitted free of duty, so long as the said articles eighteenth to twenty-fifth, inclusive, and article thirtieth of said treaty shall remain in force, according to the terms and conditions of article thirty-third of said treaty; but the provisions of this section shall not apply to any articles of merchandise mentioned herein which were held in bond by the customs officers of the United States on the first day of July, eighteen hundred and seventy-three.

SPECIAL EXCEPTIONS AS TO MERCHANDISE SUNK OR ABANDONED.

SEC. 2507. Whenever any vessel laden with merchandise in whole or in part subject to duty has been sunk in any river, harbor, bay, or waters subject to the jurisdiction of the United States, and within its limits, for the period of two years, and is abandoned by the owner thereof, any person who may raise such vessel shall be permitted to bring any merchandise recovered therefrom into the port nearest to the place where such vessel was so raised, free from the payment of any duty thereupon, and without being obliged to enter the same at the custom-house; but *under such regulations as the Secretary of the Treasury may prescribe.*

LUMBER FROM SAINT JOHN RIVER.

SEC. 2508. The produce of the forests of the State of Maine upon the Saint John River and its tributaries, owned by American citizens, and sawed or hewed in the Province of New Brunswick by American citizens, the same being unmanufactured in whole or in part, which is now admitted into the ports of [the] United States free of duty, shall continue to be so admitted *under such regulations as the Secretary of the Treasury shall, from time to time, prescribe.*

LUMBER FROM SAINT CROIX RIVER.

SEC. 2509. The produce of the forests of the State of Maine upon the Saint Croix River and its tributaries, owned by American citizens, and sawed in the Province of New Brunswick by American citizens, the same being unmanufactured in whole or in part, and having paid the same taxes as other American lumber on that river, shall be admitted into the ports of the United States free of duty, *under such regulations as the Secretary of the Treasury shall, from time to time, prescribe.*

MACHINERY FOR MANUFACTURE OF BEET-ROOT SUGAR.

SEC. 2510. See article on beet-root sugar, Appendix, p. 1779

MACHINERY IMPORTED FOR REPAIRS.

SEC. 2511. Machinery for repair may be imported into the United States *without payment of duty, under bond*, to be given in double the appraised value thereof, to be withdrawn and exported after said machinery shall have been repaired; and the Secretary of the Treasury is authorized and directed to prescribe such rules and regulations as may be necessary to protect the revenue against fraud, and secure the identity and character of all such importations when again withdrawn and exported, restricting and limiting the export and withdrawal to the same port of entry where imported, and also limiting all bonds to a period of time of not more than six months from the date of the importation.

SEC. 2512. *Eliminated.*

MATERIALS IMPORTED FOR CONSTRUCTION, ETC., OF VESSELS.

SEC. 2513. All lumber, timber, hemp, manila, and iron and steel rods, bars, spikes, nails and bolts, and copper and composition metal which may be necessary for the construction and equipment of vessels built in the United States for the purpose of being employed in the foreign trade, including the trade between the Atlantic and Pacific ports of the United States, and finished after the 6th day of June, eighteen hundred and seventy-two, may be imported in bond, under such regulations as the Secretary of the Treasury may prescribe; and, upon proof that such materials have been used for such purpose, no duties shall be paid thereon. But vessels receiving the benefit of this section shall not be allowed to engage in the coastwise trade of the United States more than two months in any one year, except upon the payment to the United States of the duties on which a rebate is herein allowed.

MATERIALS INTENDED FOR REPAIR OF VESSELS.

SEC. 2514. All articles of foreign production needed for the repair of American vessels engaged exclusively in foreign trade may be withdrawn from bonded warehouses free of duty, under such regulations as the Secretary of the Treasury may prescribe.

SEC. 2515. *Eliminated.*

DUTY ON ALL OTHER ARTICLES NOT ENUMERATED HERE; SAVE ON MANUFACTURED.

SEC. 2516. There shall be levied, collected, and paid on the importation of all raw or unmanufactured articles, not herein enumerated or provided for, a duty of ten per centum ad valorem; and on all articles manufactured in whole or in part, not herein enumerated or provided for, a duty of twenty per centum ad valorem.

APPENDIX.

SPECIAL ARGUMENTS

PREPARED BY

MR. HILL;

ALSO,

COMMUNICATIONS FROM REPRESENTATIVES OF THE PRINCIPAL
INDUSTRIES SELECTED AS IMPORTANT IN SUSTAINING THE
REVISIONS MADE IN THE PRECEDING SCHEDULES.

APPENDIX TO STATEMENTS OF METROPOLITAN LEAGUE.

COTTON AND COTTONS.

In the revisions made in Schedule A, the League has been governed by the following reflections:

The conditions of this Industry are as follows:

The product of the world, in raw cotton, 1881, was as follows:

	Pounds.
The United States.....	3,200,000,000
The East Indies.....	400,000,000
Egypt.....	250,000,000
Brazil.....	50,000,000
West Indies.....	15,000,000
Total.....	3,915,000,000

or about *four thousand million* pounds.

The United States contributes, therefore, over *three-fourths* of the world's product.

The amount of manufactured cotton made by the nations of the world is, viz:

	Yards.
Great Britain.....	5,500,000,000
The United States.....	2,250,000,000
The rest of the world.....	3,000,000,000
Total number of yards manufactured by machinery.....	10,750,000,000

Thus it will be seen that while Great Britain manufactures *one-half* of the cotton goods of the world the United States now manufacture about *one-fourth*, or *one-half* the quantity of Great Britain.

The rapid advance made, however, even in the last two years (since the last census), especially by the wonderful development of cotton manufacture in the South, has produced two great facts that must be considered, viz:

1st. The entire independence, in this Industry, of that portion of our country which formerly looked to Great Britain for cottons in return for cotton, or, in plainer words, the manufactured articles which were formerly bought with the sterling bills of exchange that paid for the raw product; hence the change in the economic system from "free trade to protection."

2d. The strong competition with British cotton manufacture in every part of the world that has but just begun, and that in the next decade will astonish those dubious and discouraging agents of foreign interests who declare that "the South is beginning manufacturing to her very great loss." Such words fall upon the ears of Southern and Western industrious and practical men as *jeu d'esprit* upon their progress or as wonderful shortsightedness. To look at our cotton conditions from other than a home standpoint, no better view could be given than the following official report by United States Consul Du Bois of Aix la Chapelle, from the cotton report of the Department of State.

THE COTTON INDUSTRY OF GERMANY, ENGLAND, THE UNITED STATES, AND INDIA.

Great interest is being manifested at present in the commercial circles throughout the German Empire respecting the vigorous efforts that are being made to revive the drooping cotton industry by the adoption of the protective system. Many interesting speeches have been made in the various chambers of commerce, and not a few able articles have appeared in the different periodicals, urging upon the imperial government the adoption of the protective system as the only salvation for the manufacturing interests of Germany.

That a nation is rich in proportion to its various industries is a fact which is being constantly demonstrated to the world; still a nation may abound in industrial pursuits and yet be miserably poor, unless those industries are prosperous; and a nation must also constantly become poorer the more it draws upon foreign markets for that which it can produce at home.

Upon this subject, Mr. Gelly, a director of one of the largest weaving and spinning associations in Germany, recently gave to the public an interesting comparative statement relating to the productive proportion of England, Germany, America, and India in the cotton industry. The comparisons made in this statement show startling facts concerning the backward strides of England and Germany, and the onward march of America and India* in the manufacture of cotton stuffs.

In drawing a parallel between the industrial interests of England and Germany, the following figures were produced: In Germany, 44 per cent. of the population are engaged in agricultural pursuits, and 37 per cent. depend upon the manufacturing industries for employment and support. In England, 21 per cent. are engaged in the former and 51 per cent. in the latter pursuits. Germany, excluding her immediate territories, possesses 4,700,000 cotton spindles, each one of which produces 24.9 kilos per year. Great Britain possesses 39,500,000 spindles, from each of which are worked only 15 kilos per annum. In the whole of Europe, excluding England, there are only 19,603,000 spindles employed, while in America there are about 10,000,000 in operation; so that England has more spindles working than both Europe and America combined. In Germany most of the cotton used is of the coarsest and cheapest sort, while in England generally the most valuable and finest is consumed.

There are 45,000,000 inhabitants in Germany, and to every one hundred of these there are 10.93 spindles in operation. England has 35,000,000 inhabitants, and to every one hundred of these there are 119.70 spindles.

It is generally acknowledged that eighteen spindles can consume cotton enough to supply one hundred persons. This being the case, Germany still requires 3,000,000 more spindles in order to furnish her home consumption. In England about 5,000,000 are enough for the home consumption, so that the cotton industry of that nation has 34,000,000 spindles with which to supply the wants of other countries.

Between 1845 and 1875 the number of spindles in England augmented 20,000,000. In the month of January, 1870, England spun and wove cotton to the amount of \$27,500,000; linen to the amount of \$3,050,000; cloth and woolen goods generally to the amount of \$9,000,000; jute, \$670,000; silk stuffs, \$1,112,000; making a total of \$41,332,000. In the month of January, 1878, there was a small shrinkage in the exports of England in the above-mentioned manufactures, so that the production amounted to \$39,282,000. From this source England secures a considerable portion of her revenue, which in the years 1873-'74 amounted to \$113,189,200, while in Germany during the same period the tax from the same source amounted to only \$26,125,100.

For the international commerce, England can command 28,773 steam and sailing vessels, with a carrying power of 5,753,973 tons.

In drawing a comparison between the United States and England and Germany the following interesting figures were adduced: The number of cotton spindles in the United States increased from 5,235,667 in 1867 to 10,054,364 in 1875. Ten years ago it could scarcely be said that the United States was an exporter of fabricated cotton. Six years ago American exporters sent \$2,304,000 worth of fabricated cotton to the European markets, and this amount was increased last year to the round sum of \$10,000,000. These figures show conclusively that the cotton industry in the United States is far more progressive and prosperous than it is on the continent of Europe. The Americans have driven the English not only from the American markets, but from the European markets, and even in the English markets they have commenced a most successful competition.

A glance at the manufacturing industry of British India shows another field of competition which gravely threatens the manufacturing interests of England and continental Europe. Mr. Gelly says in his report that within the last fifteen years the number of cotton spindles in India has increased from 338,000 to 1,231,000, and that the export of fabricated cotton has increased in the three years from 1874 to 1876 nearly 100 per cent. The marvelous increase of the cotton industry in America and India is causing intense anxiety among the spinners and weavers of England, and, in truth, throughout the manufacturing districts of Europe.

After a careful examination of the condition of the cotton industry in Germany, Mr. Gelly comes to the following conclusion: That the crisis which has raged for several years in the cotton industry of Germany has arisen in a great measure from the over-production of England and the increase in the number of spindles in America and

*Great Britain has become so alarmed at this competition from India that Her Majesty's Government there has ordered a suppression thereof by the total abolition of cotton and general import duties.

India. *That the protective system is in no manner a hinderance to the commercial development of a country, but, on the contrary, is a source of prosperity and wealth, and that Germany having undervalued this great truth, now finds her great industries in a state of stagnation which does not exist in any of the other manufacturing countries of Europe."*

The very rapid development of conditions in our country even in last two years causes the figures above (given in 1879) to be rather an underestimate for to-day; still it is a generous presentation and comparison of facts, which well illustrates the prosperity of our cotton manufacture and our ability to lessen proportionately our tariff rates thereon judiciously and equitably, but not in one destructive blow and for the pleasure of our friendly competitors, as in India.

EARTHENWARE.

Regarding this Industry one of the most important in usefulness, as well as contributing to the art talent of our country, the League asks especial consideration of the Commission thereto.

[Paper of Mr. Thomas C. Smith, President Union Pottery Works.]

In the manufacture of hard porcelain table ware (that species of ware commonly known as French china) the same materials are used and the same detail of process is employed as in making French porcelain.

First. The present duty of 45 per cent. on white china should not be altered, as it is preferable to have a low and permanent rate of duty than a temporary high rate of duty, with the certain prospect of a lowering of that high rate in a few years, and again agitating this question. This present rate, with the full intent of the law properly executed as regards classification of goods and goods honestly invoiced, is sufficient to enable the manufacturer in this country to compete with imported goods by the further application of machinery and a constant effort to lessen cost of production.

Second. The duty on all decorated ware should be 60 per cent., for the reason that in old countries, where labor is abundant, great numbers seek employment in this line and are content with low wages at light work, whereas in this country in the absence of free art schools, which should be supported by our States and principal cities, the few young people who learn to paint a shrub or flower consider themselves artists and demand wages equal to their pretensions. Consequently that branch of our business pertaining to the decoration of ware is dependent principally upon foreign workmen at high wages who have learned their trade in the schools or factories of Europe.

Third. The present duty of \$5 per ton on clay should be reduced to \$3, or at most \$3.50 per ton, for the reason that the duty on clay should not be higher than the duty on articles manufactured from it. At the present time the duty is from 70 to 120 per cent. At \$3 per ton the duty would average from 40 to 60 per cent.

FLAX, JUTE, AND HEMP.

The League indorse the following petition of the Flax and Hemp Spinners and Producers of the United States as a harmonious basis of Tariff rates, mutually conceded to be just and equitable for the desired development of that Industry, and has specified the same in the proposed rates given in Schedule C, page 1718, accordingly.

PETITION.

Several millions of dollars have been expended by more than fifty flax-spinning mills in an effort to manufacture linen goods in the United States, but, although capital was not lacking, The American Linen Company, Fall River, Mass., The Willimantic Linen Company, The United States Linen Company, The Sprague Linen Company, and many others, had to abandon the business because the great disparity in cost of labor between European and American necessitated a protection larger than the tariff afforded, so that the present manufacturing establishments number about one dozen, and this industry, which England fostered by imposing a duty on foreign linens, paying a bounty on all linen cloth produced, and an additional bounty on all that was exported, may be designated as in its infancy, needing a protection such as was and is accorded to cotton, worsted, and silks.

With a uniform duty of 50 per cent. ad valorem on flax, hemp, and jute manufactures, an immense impetus would be given to this industry, so that all the coarser fabrics, as well as yarns and twines, would be made in this country, spinning the flax, which the farmer now burns to the extent of 500,000 tons annually, or allows to rot as valueless in the field.

We recommend that the present duties on the raw and dressed flax and hemp be increased a little, as a protection to the agriculturist and flax dresser, viz, tow, \$15 per ton; flax, \$30 per ton; hackled, \$50 per ton. That Schedule C, paragraph 41, be

so amended that where the words "linen yarns" occur, flax-tow yarns be substituted and that in place of 35 and 40 per cent. ad valorem, there be a duty of 50 per cent. on all yarns, threads, twines, and woven fabrics made from flax or flax tow, hemp, or jute, and that paragraphs 42 and 43 of Schedule C be also included in the 50 per cent. ad valorem duty. We also ask that Schedule L, class 3, paragraph 257, be so changed that it shall read hemp or jute carpeting, eight cents per square yard, and on all colored or partly colored, manufactured of jute, hemp or flax, or of which these compose the chief part, 8 cents per square yard, except that carpeting, by whatever name known, when made substantially in the same manner as Brussels carpeting, wrought by the Jacquard machine, or printed on the warp or otherwise, after the manner of tapestry carpeting, or tapestry velvet carpetings, or any other kinds of carpeting, shall, in each case pay the same duty as the carpetings they are made to imitate; that it shall not be lawful to allow any drawback of duty upon bags made of jute, flax, or hemp, or of which these compose the chief component part, except when exported in the original package.

About \$30,000,000 spun and woven fabrics, the manufactures of flax, jute, and hemp, are annually imported, and we confidently assert that a large proportion of the above staple goods could be made in this country, giving profitable employment to the skilled labor and also to the farmer, if the reasonable protection we ask for is given to the development of these important manufacturing industries which we represent.

Jute, the raw material, is taxed an average duty of 29 per cent., and the manufactured goods a duty of 25 to 30 per cent., so that jute goods are comparatively without protection.

	Per cent.
Hemp and its products pay an average of about	25
Flax and its products pay an average of about	30
Silk and its products pay an average of about	60
Cotton and its products pay an average of about	65
Wool and its products pay an average of about	85

IRON ORE.

In sustaining its recommendation for the rate of \$2.00 per ton upon Iron Ore in Schedule E the League offers the following argument:

The wealth under our soil is vastly greater than its superficial value which has, until recently, contented the owners of millions of acres in grain and textile cultivation while ignorant of or indifferent to the millions of dollars within the radius of these acres, the labor that might have been employed, the homes that might have been built, and the increased demand that would have been general for agricultural products to the farmers' profit.

And even yet there seems strong opposition to the developing of this under-surface wealth by proper encouragement in protection to our mining industry.

Such opposition may be animated and severe, but it cannot be successful.

This treasure is no longer hidden, and its development is demanded by the South and West.

Ore of iron, copper, lead, &c., must have a proper protective rate for home facilities in time of emergency, and for the reduction of price by home competition with foreign countries.

Senator Vance, of North Carolina, said in Congress last season:

"I want all American labor to have a fair and even chance. I want my own poor workingmen at home protected, not only against foreign paupers, but also against domestic brigandage. Almost every item of foreign raw material used by our factories is the product of foreign 'pauper labor,' and is admitted duty free. By the report of the Chief of the Bureau of Statistics for the three months ending September 30, 1880, there is seen a statement of the imports of iron ore which shows a total of

425,000 tons, worth \$1,192,000, brought from every quarter of the world, all dug by pauper labor, and much of it even by convict labor, as I am informed, notably 113,000 tons from the French possessions in Africa. This, in preference to the ore dug by free American labor in Alabama, Georgia, Tennessee, North Carolina, and other States. It comes in as ballast in foreign bottoms, to the detriment of American ship-owners."

Here is a foreshadowing of the demand that will be made for a proper rate of protection upon Iron Ore of the "Old North" State, viz, at least \$2.00 per ton.

Alabama abounds with iron, and has suddenly appeared seventh in rank as an iron State.

The total production in the United States, as given by the census returns of 1880, was—

States.		Total product.	States.		Total product.
		Tons.			Tons.
1	Pennsylvania*	2,185,675	14	West Virginia.....	61,216
2	Michigan*	1,834,712	15	Wisconsin.....	41,440
3	New York.....	1,202,127	16	Connecticut.....	35,018
4	New Jersey.....	757,372	17	Oregon.....	6,972
5	Ohio.....	547,303	18	Maine.....	6,000
6	Missouri.....	386,197	19	Texas.....	3,000
7	Alabama.....	191,676	20	North Carolina.....	3,318
8	Virginia.....	182,326	21	Delaware.....	2,726
9	Maryland.....	139,628	22	Vermont.....	500
10	Tennessee.....	104,405	23	Indiana.....	513
11	Georgia.....	91,416			
12	Kentucky.....	64,809		The United States.....	7,971,706
13	Massachusetts.....	62,637			

* Notwithstanding the excess in production of Pennsylvania over Michigan of 300,000 tons, the value corresponding was \$5,517,000 to \$6,035,000, an excess in value in favor of Michigan of \$500,000, showing superior quality of iron in the latter State.

This production has determined two of the most important questions of our country's prosperity, viz:

1. Independence at all times in great manufacture and armament.

2. Reduction of price, as will be seen by the fall in percentage of cost in the following proportion since the census of 1870, viz:

Michigan, a fall of 15 per cent.; New Jersey, a fall of 30 per cent.; Missouri, a rise of 56 per cent.; New York, a fall of 29 per cent.; Pennsylvania, a fall of 35 per cent.

This shows the great demand westward for iron by the increase of price in Missouri and the necessity for its development in the Western States, which will be retarded until due encouragement is given. With a view to establish beyond doubt or discussion, and also as contributing to harmony of opinion regarding the true conditions of iron ore production, the Secretary of the New York State Iron Ore Producers' Association recently sent out a circular making the following inquiries:

"First. The alleged necessity of the importation of foreign ores from lack of American ores for the Bessemer process.

"Second. The claim that American ore producers have an enlarged market by reason of such importation of foreign ores, each ton of foreign ore so used causing the consumption of an additional ton of American which would not otherwise be used.

"Third. That the importation of foreign ores is an adjunct to the steel business only, and has not the effect of competing with native ores for manufacturing of ordinary foundry and mill irons."

To which inquiries response has been very generally made, and from which the following extracts are taken, and submitted to the Metropolitan Industrial League for consideration:

Mr. James A. Burden, president of the Burden Iron Company, of Troy, N. Y., a company consuming in its own furnaces ten times the quantity of ore that it mines and three times the quantity of pig metal it produces, writes:

"The Chateaugay Company have already opened two parallel veins of this Bessemer steel ore upon their property; one of these veins averages 18 feet thick, and the other 36 feet thick. One of these veins has been opened continuously, and is now being worked on its outcrop (which has only a few inches of cover) for a distance of about 1½ miles, and this vein has been traced continuously on the company's property for a distance of about 5 miles. The distance between the two important workings at the present time on this vein is about 3½ miles; and the company have other veins which have not been traced or examined.

"This property alone, from the veins already explored, is capable (in the opinion of a competent authority who has had the experience and the opportunity to judge of its resources) of producing 6,000,000 tons of Bessemer steel ore per annum."

Witherbees, Sherman & Co., of Port Henry, New York, producers of over 200,000 tons of iron ore per annum, write as follows: "We have in Northern New York more Bessemer ores than is required to supply the demand, but have not been able to run our now bed Bessemer mine for the last eighteen months, on account of the importation of foreign ores."

The mine referred to has a capacity of 60,000 to 80,000 tons per annum, and produces an excellent quality of Bessemer ores.

A. Tower, esq., treasurer of the Port Henry Iron Ore Company, producers of over 200,000 tons of ore per annum, writes as follows: "In my opinion there is no necessity for such importation of ores, if encouragement is given. All that is wanted can be furnished from mines in this country."

The Port Henry Iron Ore Company is operating the Fisher Hill Bessemer ore mine, having a capacity of 75,000 to 100,000 tons per annum. The production at present is 15,000 tons.

Mr. Henry M. Brame, secretary of the Forest of Dean Iron Ore Company, producing at present about 30,000 tons of ore per annum, writes as follows: "There would be no lack of American Bessemer ores if the development of the mines had not been checked by foreign importation."

Mr. A. W. Humphreys, president of the Sterling Iron and Railway Company, producers of about 80,000 tons of ore per annum, writes: "I believe that there is no necessity for any importation of ores."

George Williams, esq., president and treasurer of the Weed Iron Mining Company, writes as follows:

Hon. SMITH M. WEED:

MY DEAR SIR: I this day wired to your secretary an estimate of the actual capacity of the hematite mines of the Harlem Valley, and remit an estimate of their actual output in 1882, showing that the demand, through foreign competition, was so lessened as to reduce the volume of business from 177,000 tons to 76,000 tons.

Perhaps the most instructive letters are the two following, from two producers of Bessemer iron ores who can find no market for their ores:

Mr. J. F. Rand, treasurer of the Manhattan Mining Company, writes as follows: "Our mine is virtually closed at the present time. Having worked out our contracts with our customers and not obtaining any new ones, we have stopped working, except the pumps, which we are obliged to keep at work. As you will see by the inclosed analysis, it is steel ore, and was used extensively in making Bessemer pig by one of our largest customers until the foreign ore took its place. We have employed 75 to 100 men at wages varying from \$1.25 to \$1.50 per day for ordinary laborers."

Mr. J. B. Brinsmade, president of the Mahopac Iron Ore Company, writes as follows: It may be well to note here that the ore he refers to is the richest and purest Bessemer ore to-day mined east of the Alleghenies, yielding from 55 to 58 per cent. in the furnaces, and containing practically no sulphur and only .018 of 1 per cent. phosphorus.

Regarding the second question, viz: "That American ore producers have an enlarged market by reason of such importation of foreign ores, each ton of foreign ore so used causing the consumption of a ton of native ore, which would not otherwise be used," the answers to this question can be summed up in the answer of Mr. J. B. Brinsmade, president of the Mahopac Iron Ore Company. The answer is short and to the point: "It is sheer nonsense."

Mr. Henry M. Brame writes: "This is an extraordinary proposition, and too absurd to answer."

Mr. Peter P. Parrott, president of the Parrott Iron Company, a large consumer of iron ores, writes as follows: "When we are using foreign iron ore, we are using just so much less native ore. I think the consumption would have to be enormous to warrant such a conclusion as above claimed."

A. W. Humphreys, president of the Sterling Iron Railway Company writes: "The claim seems to me to be entirely unfounded."

A. Tower, treasurer of the Port Henry Iron Ore Company, writes: "I consider the above claim entirely false, and that every ton of ore imported takes the place of ore that can be furnished from mines here. All we need is capital to develop our mines."

Witherbees, Sherman, & Co., of Port Henry, write as follows: "Before foreign ores were imported we had a surplus of lump ore for puddling, but for the last three years we have had a surplus of fine ore used in furnaces. It is increasing every year since the importation of foreign ores."

Regarding the third question, viz: "That the importation of foreign ore is an adjunct to the steel business only, and has no effect in competing with native ores for ordinary foundry and mill iron," John H. Cheever, president of the Croton Magnetic Iron Mine, writes as follows: "It has and does compete with our ores; we know of orders we have lost to a large amount."

A. W. Humphreys, president of the Sterling Iron Company, writes: "This claim, I am sure, is without foundation."

Peter P. Parrott, president of the Parrott Iron Company, writes: "We have used the foreign Bessemer ore for two years, but don't produce iron for steel purposes."

Henry M. Brame, writes: "Foreign ores compete with native ores for furnace and mill purposes more and more every year."

J. B. Brinsmade writes: "In the beginning foreign ores competed only with native Bessemer ores, but for the last two years they have competed just as decidedly for foundry and mill purposes; and that this competition has not yet reached an alarming extent is due to the fact that the mines which produce ores for foundry and mill irons are older than Bessemer mines and more developed, and are consequently better able to meet competition."

In view of the great importance of this subject, and the necessity of its being understood at this time, when a strong effort is being made to wipe out the duty thereon, and thus retard its development, the League earnestly urge that a duty of \$2 per ton be placed upon all iron ore.

TIN PLATE.

The League also offers the following paper under the same Schedule:

[Paper of the Iron and Tin Plate Manufacturers.]

The Metropolitan Industrial League, New York:

GENTLEMEN: We have to suggest a change in the existing tariff relating to the articles commercially known as tin plates, terne plates, and tagger's tin.

We refer you to §§ 129, 130, and 131 in the "indexed tariff," which read as follows:

"129. Tin in plates or sheets, terne and tagger's tin: fifteen per centum ad valorem.

"a. On tin in plates or sheets, and on terne and tagger's tin: one and one-tenth cents per pound. Act of February 8, 1875, sec. 4.

"130. Iron and tin plates galvanized or coated with any metal by electric batteries: two cents per pound.

"131. Iron and tin plates galvanized or coated with any metal otherwise than by electric batteries: two and one-half cents per pound."

We felt convinced that these sections of the law are not carried out in accordance with the intentions of the framers of the same, and finding that we were seriously injured by misconstruction of the law, we submitted our case to the Treasury Department during the year 1878. The Hon. John Sherman, then Secretary of the department, in a letter dated June 3, 1878, replied as follows:

W. C. CRONMEYER, ESQ.,

Secretary of the United States Iron and Tin Plate Company, Pittsburgh, Pa.:

SIR: I have received and considered your letter of the 22d ultimo, relative to duties now collected at the various ports of the United States on the article known to commerce as tin plate.

The article is not pure tin rolled out into plates, but is iron coated with tin. The duty collected thereon is 1.1 cents per pound under the provision in section 4 of the act of February 8, 1875, for tin in plates or sheets and terne or tagger's tin.

The claim, made by you on behalf of the company you represent, and other domestic tin-plate manufacturers, is that this article should pay a duty of 2½ cents per pound under the provisions of Schedule E of the revised tariff, for iron and tin plates galvanized or coated with any metal other than by electric batteries.

In regard thereto I have to state that while the terms used in section 4 of the act of February 8, 1875, under which this article is admitted at a duty of 1.1 cents per pound, viz, tin in plates or sheets, are not aptly descriptive of the merchandise, it is found that the same terms were used in the act of 1864, and have been used in subsequent tariffs, and that under each of the tariffs mentioned the article commercially known as tin plate has been considered as embraced within such terms.

The subject was brought to my attention some time since, and, upon examination, it was found that the Secretary of the Treasury, under date of July 22, 1864, stated, in a letter addressed to the collector of customs at New York, that the clause in the act of 1864, which enhanced the duty on tin plates, and iron galvanized or coated by any metal by electric batteries or otherwise, was not intended to increase the duties upon the article commercially known as tin plate.

It was then held that the tin plates as well as the iron must, after they arrive at that condition, be subsequently galvanized or coated in order to bring them within the increased duty. I inclose a copy of the letter referred to.

I have therefore to state that the construction thus given to the law by this department having remained in force from 1864 to the present time, I do not feel at liberty to place any other construction upon the law, especially in view of the fact

that the changes in the tariff subsequent to 1864, as to this article, have undoubtedly been made with a full knowledge, by Congress, of the action taken by this department in the premises.

The remedy you seek must therefore be found at the hands of Congress rather than of this department.

Very respectfully,

JOHN SHERMAN, *Secretary.*

It being thus admitted that the terms used are not aptly descriptive of the merchandise which is brought in under the said clause, and as your honorable body contemplates the removal of existing incongruities, and as we have been engaged in the manufacture of tin and terne plates for a number of years, and are for that reason, perhaps, capable of describing the article more aptly, would now take the liberty to suggest that §129 be amended by striking out all, and inserting therefor the following, viz:

"All plates and sheets of iron or steel, or taggers iron, coated with tin or lead, or with a mixture of which these metals are a component part, by the dipping or any other process, and now known as tin plates, terne plates, and taggers tin, and by whatever name hereafter called, two cents and three-fourths per pound."

We believe that it was the intention of the framers of the law, which was enacted in 1864, that the article commercially known as tin plates should come in under a duty of 2½ cents per pound, for that law contained a clause which read: "On tin plates, and iron galvanized, or coated with any metal by electric batteries, or otherwise, two cents and a half per pound." To anybody acquainted with the process of making tin plates the wording as above will appear very plain and clear, but the Hon. W. P. Fessenden, who was Secretary of the Treasury Department in 1864, evidently did not know that tin plates were iron coated with tin, but, like many other people, was rather under the impression that they were made from pure tin, or from an alloy; for in no other way could he have arrived at the following decision, which is contained in a letter dated July 22, 1864, addressed to Hiram Barney, collector of customs, New York, viz: "It would appear that an error of punctuation has been made by some one; most probably by the clerk who engrossed that part of the act. If the comma, which is inserted after the word 'plates' be omitted, and a comma placed after the word 'iron,' the true sense will be had, which unquestionably is that the tin plates as well as the iron must be galvanized or coated with any metal by electric batteries, or otherwise, in order to bring them within the provision."

It is our opinion that Mr. Fessenden, instead of arriving at the true sense, was seriously mistaken, for tin plates are coated with the most costly metal that is used for these kind of plates, and it would hardly add to their commercial value if they were coated again with an inferior metal. In this case the engrossing clerk was certainly better posted than Mr. Fessenden himself.

The clause which provided for "tin in sheets or plates," and under which clause Mr. Fessenden directed "ordinary tin plates" to be brought, was undoubtedly intended for sheets or plates of pure tin. Block, or pig tin, being a raw material, not found in this country, was put on the free list.

The labor and expense involved in reducing pig tin into sheets or plates is very small, and therefore a duty of 15 per cent. ad valorem was deemed sufficient protection for the manufacture of that article.

At present sheets of pure tin are hardly an article of commerce, the few purposes for which it was used at one time having been supplied by other more suitable articles.

The United States are consuming more tin plates—that is, tinned iron plates—than any other country in the world, yet for the production of that article they have to depend entirely on foreign countries.

The total production of this commodity in England has grown from about 1,000,000 boxes in 1860, to nearly 6,000,000 boxes in 1881, and of the latter about 1,250,000 boxes or cwts. were used for home consumption, 4,000,000 boxes exported to the United States, and 750,000 boxes exported to other countries.

In 1860 there were in operation in England about 100 trains of rolls making sheet iron for tin-plate purposes; in 1881 there were in operation nearly 400 trains of rolls, and about 30,000 persons found direct employment in this industry.

Had it not been for Mr. Fessenden's misconception of facts, the most of the 4,000,000 boxes, or 200,000 tons, that were consumed in this country during the last year, as well as most of all consumed during previous years, would have been manufactured in this country.

To prove the feasibility of making tin and terne plates of good quality, we will give a few of the many acknowledgments we have received from our customers.

SAINT LOUIS, July 13, 1877.

UNITED STATES IRON AND TIN PLATE CO., Pittsburgh, Pa.:

GENTS: The terne plates, branded "U. S.," which we have bought of you, have

proved, in nearly all cases, to be equal in quality and finish to most of the good brands of terne plates of English make which we have sold.

Very respectfully,

R. SELLEW & CO.

CINCINNATI, July 16, 1877.

UNITED STATES IRON AND TIN PLATE CO., *Pittsburgh, Pa. :*

GENTS: The terne plates purchased from you gave good satisfaction, several parties preferring your make to the imported.

Yours, truly,

SELLEW & COMP.

CINCINNATI, July 13, 1877.

UNITED STATES IRON AND TIN PLATE CO., *Pittsburgh, Pa. :*

DEAR SIR: We have sold several lots of your U. S. terne plates, and find that they have given general satisfaction, the finish and quality being fully equal to foreign plates of the same grade.

Yours, &c.,

T. H. LAWSON & CO.

BUFFALO, N. Y., July 12, 1877.

UNITED STATES IRON AND TIN PLATE CO., *Pittsburgh, Pa. :*

GENTS: It gives us pleasure to say we have used large lots of your terne plates. We have always found them good and run heavier than the imported plates.

Respectfully,

JOHN C. JEWETT & SONS.

CHICAGO, ILL., July 13, 1877.

UNITED STATES IRON AND TIN PLATE CO., *Pittsburgh, Pa. :*

GENTS: We have sold several lots of your roofing tin plates; we found them to be of good quality, and they gave entire satisfaction.

Truly, yours,

MILLER BROS. & KEEP.

CHICAGO, ILL., July 13, 1877.

UNITED STATES IRON AND TIN PLATE CO., *Pittsburgh, Pa. :*

GENTS: So far as our experience in selling your manufacture of tin plates extends, we cheerfully testify to its being in every way satisfactory.

Yours, respectfully,

SEEBERGER & BREakey.

CLEVELAND, OHIO, July 16, 1877.

UNITED STATES IRON AND TIN PLATE CO., *Pittsburgh, Pa. :*

GENTS: As we have sold some of your terne plates, we feel justified in saying that they have proved perfectly satisfactory, both in covering and in quality; the metal possesses the requisite toughness for all purposes it is used.

Yours,

GEO. WORTHINGTON & CO.

MILWAUKEE, Wis., July 17, 1877.

UNITED STATES IRON AND TIN PLATE CO., *Pittsburgh, Pa. :*

GENTLEMEN: The terne plates we have received from you have given all of our customers general satisfaction, their uniformity and toughness making it superior to a large number of imported brands. We have no doubt of increased sales as your brand becomes better known, and, with correspondent cost with the imported, preference will be given your make.

Very truly, yours,

JOHN NAZRO & CO.

BALTIMORE, MD., July 16, 1877.

UNITED STATES IRON AND TIN PLATE CO., *Pittsburgh, Pa. :*

GENTLEMEN: The tin plates we have purchased of you have been entirely satisfactory in every respect. It is as well covered and the metal as malleable as any imported we have used.

Yours, truly,

MATTHAI, INGRAM & CO.

PITTSBURGH, September 20, 1878.

UNITED STATES IRON AND TIN PLATE CO., City :

GENTLEMEN: We have been selling your United States roofing plates for the past two years to the extent of several thousand boxes, and have always found it to give entire satisfaction, many of our customers telling us that it is superior to English plates, and we believe it to be fully equal to the best known brands of imported plates.

Yours, truly,

FLEMING, AGNEW & CO.

PITTSBURGH, November 20, 1877.

UNITED STATES IRON AND TIN PLATE CO., City :

GENTLEMEN: We can testify best to the merits of the United States terne tin by repeating the remarks of several practical tinnors who have been buying from us for several years, and who say that they find your plates in every way equal, and in one respect far superior, viz, it is much less liable to rust when exposed to the atmosphere, having purposely tested it side by side on the same roof with English plates.

We are, respectfully, yours,

DEMMLER BROS.

To produce 4,000,000 boxes, 200,000 tons, of tin plates, which we consumed during the last fiscal year, in a central location of the iron industry in this country, we would have to expend about the following amounts for material and labor, about 80 per cent. of which we can produce in superior quality at home, block tin and palm oil being the only articles we cannot produce:

260,000 tons of pig metal, at \$23.....	\$5, 980, 000
1,000,000 tons of coal, at \$1.40.....	1, 400, 000
4,000,000 bushels charcoal, at 9 cents.....	360, 000
Repairs and maintenance of machinery and furnaces.....	800, 000
Lubricators, &c., for rolling-mill machinery.....	100, 000
30,000,000 pounds of sulphuric acid, at 2 cents.....	600, 000
10,000,000 pounds of palm oil or tallow, at 6 cents.....	600, 000
3,500,000 pounds of lead, at 5 cents.....	175, 000
22,000,000 pounds of tin, at 20 cents.....	4, 400, 000
20,000,000 feet of lumber, made up in boxes for packing, \$25 per M.....	500, 000
Wages to about 15,000 tin-mill employes, \$2.90 per box, or \$58 per ton ...	11, 600, 000
Incidental expenses, insurances, taxes &c.....	1, 000, 000
Total cost of producing 200,000 tons in United States (\$140 per ton).....	27, 515, 000
The appraised value of the imported plates without duty is given as.....	16, 599, 000

Showing a difference in the cost of production of this commodity in the two countries of..... 10, 916, 000

Had the rate of 2½ cents per pound been enforced during last year, the total duty would have amounted to \$10,826,329.75, and the difference would have almost been equalized.

And had the same duty of 2½ cents been enforced during all these eighteen years, the total amount of duty would have been \$92,472,778, instead of \$38,415,208, showing that the country has lost \$55,057,570 by the misconstruction of the law.

The difference in the cost of production in these two countries has its reason almost exclusively in the difference of the wages that are paid in the production of the different materials which are used for making tin plates. A large amount of the labor, for which we here employ men and grown-up boys, is in England performed by women and small children. Itemized, the differences would be about as follows:

The amount of wages paid in the United States exceeds	
those paid in England on a ton of pig metal.....	\$7 00
On five tons coal necessary to convert one ton.....	3 00
	————— \$10 00
35 per cent. of lost labor by wasting of material and material	
returned to scrap pile.....	3 50
	—————
	\$13 50
On one ton of sheet iron.....	30 00
On maintenance and repairs of machinery.....	1 60
On sulphuric acid.....	
On palm oil and tallow.....	

On 80 pounds of lead	\$1 60
On packing boxes	80
On lubricants	47 50
15 per cent. of lost labor by wasting material and defective sheets.	7 12
<hr/>	
Total difference per finished ton	54 62
Or, on the 200,000 tons	10, 924, 000 00

What we ask now is that the law be so constructed that the difference thus shown be equalized by a tariff duty, in the same manner as has been done on other commodities which either enter into the manufacture of tin plates, or which are similar in substance, and come into competition with tin plates in our markets.

N. B.—The figures are computed from actual results and experiments made at the United States Iron and Tin Plate Works during several years. The above wages and number of hands employed are exclusive of labor necessary to produce the aforementioned materials.

We beg to call your attention to the following comparative table :

Commodity.	Average market price.	Rate of duty.	Price, less duty.	Ad valorem rate.
				<i>Per cent.</i>
Pig metal	\$23 00	\$7 00	\$16 00	43½
Bar iron	02½	01	01½	57
Sheet iron, 20 to 25, wire gaugo.....	04. 3	01½	02. 8	53½
20 gaugo and lighter	04. 75	01½	03	58
Galvanized sheet iron	07	02½	04½	55
Pig lead	05	02	03	66
Russia polished iron	11	03	08	37½
Pickled and cold rolled sheets.....	05½	01½	04	37½
Tin plates and terne plates	05. 7	01. 1	04. 6	24

This table alone, we think, will convince you that the tin-plating business cannot be successfully carried on in this country under present circumstances. The duty we now propose would be 2½ cents per pound, or 60 per cent. ad valorem.

During the last ten years the jobbing price of IC tin plates has varied from \$12.50 to \$5.50, and a computation shows that the average price of a box of IC (the standard size, or 112 pounds) was, during the same period, \$8.50, or \$170 per gross ton. As we have shown that with the present facilities and the present market prices of material we can make a ton here at \$140, and as there is every likelihood that we shall improve these facilities when a larger number of manufacturers enter into this business, there is very little danger that even with the increased duty the average price to the consumer would be higher during the next ten years.

With a mill situated in a central location of the United States we could reach the jobber and actual consumer more directly, and to them we would save the expenses of the handling and rehandling, commission, and broker's charges, &c., and thus make up for nearly the amount of the extra duty.

But admitting, for the sake of argument, that the cost of the articles made from tinned plates would be enhanced, would our fruit and oyster canners suffer seriously by paying about four cents more per dozen quart cans ? and would not our dairymen

and farmers be fully recompensed by the additional demand for their products, coming from people occupied by means of such new industry.

Tinned ware is so universally used that if the increased duty were a tax, hardly any other tax could be more evenly distributed.

We are, most respectfully, yours,

BREADSTUFFS AND PROVISIONS.

Conforming to the views expressed in the following letter, the League has deferred further revision of Schedule F, than made on page 1728, viz: on Animals, Eggs, and English Biscuit, which have been added to this Schedule for the reasons given herewith, following the letter from the Produce Exchange.

NEW YORK PRODUCE EXCHANGE,
New York, October 12, 1882.

CHARLES S. HILL, Esq.,
Metropolitan Industrial League, 319 Broadway, New York:

DEAR SIR: The President desires me to say to you that the examination which he has been able to give the papers relating to the proposed revision of the tariff which were addressed to the Exchange by the Industrial League only serves to confirm his conviction that it would be impracticable for this Exchange to give a suitable expression to its views on this very important subject at the present time.

Respectfully yours,

S. H. GRANT, *Superintendent.*

The necessity of a protective tariff has been so frankly and concisely presented to the Commission by the gentlemen representing English Biscuit or "fancy crackers," page 17, that an increased rate is asked thereon.

The United States Consul at Prescott, Canada, reports that

"Eggs enter largely into the exports of this consulate. During the year ending June 30, 1881, the declared export of eggs from this consulate amounted to \$280,000. Taking in the amount exported in lots of less than \$100 in value, would bring the amount for the year over \$300,000. A duty of *one cent per dozen* on eggs imported into the customs districts of Oswegatchie and Champlain, N. Y., and the district of Vermont, would pay the entire expenses of those collection districts, and this without increasing the value or price of eggs to the consumer in the United States."

The above rate is therefore recommended. Attention is also asked to the following comment from the Consul at Port Sarnia, Canada. Paragraph 555, it will be seen, page 81, provides only for importation *beyond the sea*, to which attention is also called.

"Some years ago Congress deemed it wise to remove the duty on animals of superior breed imported into the United States especially for breeding purposes. At the time, this action of Congress met the hearty approval of farmers and breeders everywhere, and I have no doubt but this legislation had a tendency to stimulate to some extent the desire on the part of the American farmer to improve the breed of his domestic animals. Large numbers of horses, cattle, and sheep, and swine were purchased in Canada by American buyers for this purpose, and the sale of breeding animals still continues to a very large extent. The Canadian stock-raiser was not slow in finding out that animals especially adapted for breeding purposes were in growing demand, whilst the prices of working horses, store cattle, and sheep, only merchantable when consigned to the slaughter-house, the livery stable, or the plow, had not advanced very materially in price. The animal which had been raised to the dignity of a breeder at once became much more valuable to the Canadian stock-raiser, and as a consequence the price to the American buyer was correspondingly advanced, in most cases fully 50 per cent."

Here we have another lesson from observation, and it teaches this: The only farmer who has been benefited by the abolition of the duty on breeding animals is the Canadian farmer; the mare which for ordinary purposes he had sold for \$100 he now finds to be more valuable to the American buyer, as in consequence of her admission to free entry the purchaser for the American market can afford to pay at least an advance of 20 per cent., the sum which under former tariff regulations he was called upon to pay as duty to the United States Government. But the Canadian stock-raiser does not stop at a mere advance of 20 per cent., but in most cases the value of breeding animals are advanced 50 per cent. and even more, and the transaction may be analyzed thus: The Canadian farmer gets \$50 more than he would have received but for the abolition of duty on the wares he sells; the American buyer pays \$50 more than he would have paid had the duty been allowed to remain, and the United States Government derives not a cent of customs revenue from the importation.

This refers to the free importation of breeding animals, as in this case it seemed to be the desire of Congress to remove, as much as possible, what seemed to be a burden to the American stock-raiser, and to inspire him with a desire to improve the breed of his animals. In some degree, as before intimated, he may have been encouraged to purchase superior animals for breeding purposes, but the cost of these animals has not been lessened to the American buyer by legislative enactment. As in all other like acts of legislation, it has only enriched the foreign producer at the expense of the American purchaser.

SUGAR.

BEET-ROOT.

Under Schedule G the League offers the following suggestions as evidence that the North and West are as much interested in the rates proposed as the present Sugar-cane producing states.

The wonderful progress and profit realized by this new Industry in Germany draws the attention of American agriculturists to the production thereof with great interest and importance. By proper attention to the cultivation of the beet and necessary encouragement of the industry while in its infancy a successful development in the United States is inevitable, and the following information from United States Consul Potter, "Consular Reports," is valuable:

"For the benefit of the farmer proposing to engage in the culture of the sugar-beet, I will suggest that deep, rich, moist, bottom land is dangerous ground upon which to experiment with a view of obtaining successful results. From such lands he may obtain enormous crops in bulk and weight (20 to 25 or more tons per acre), but his product will be merely water, with very little sugar, and the more tons he raises the more complete will be his failure. He will furnish the manufactory with a large amount of bulky material, while the product in sugar will be very discouraging. It is well known that many of the French farmers, who cultivate a kind of beets which grow very large and partly above ground, often produce 30 tons to the acre, and yet utterly fail in the business, while the prudent and thinking German succeeds admirably with smaller beets, producing 11 or 12 tons to the acre. In one case a great weight of water is produced, containing a small amount of saccharine matter, while in the other a beet is produced rich in sugar properties, and yielding more pounds of sugar to the acre with less than half the labor and cost of production.

"Rolling, and even hilly land, where there is not an excess of moisture, is best for the sugar-beet. It should be strong and well enriched. One of the very best fertilizers is wood-ashes and material containing alkaline properties. The elements that produce sugar in the maple tree will develop sugar in the beet. In this connection it may be mentioned that ashes from the wood of the sugar-maple tree are regarded as among the most valuable of all ashes in the production of potash.

"These hints will be quite enough for the intelligent farmers of the United States, and if those who propose to engage in the culture of sugar-beets will carefully study the subject they wish to master, and remember that they should seek to produce the largest quantity of sugar in the smallest amount of raw material, and that it is concentrated substance and not bulk or magnitude of material that is wanted, success in sugar-beet culture will be assured.

"The manufacture of beet sugar by hydrostatic pressure is now obsolete in Germany, the diffusion process being adopted instead, because the percentage of sugar obtained from the beets has been largely increased by the latter method. By the old process 20 to 30 pounds of beets were required to produce 1 pound of sugar. By the new method 10 to 12 pounds only of beets, of good average quality, produce 1 pound of sugar, besides a considerable percentage of molasses.

"The following table shows in detail the average cost of extracting, by improved German machinery, the raw sugar produced by 1 cwt. of beet-roots of good average quality:

Table showing average cost of working up 1 centner beet-roots, the product of which is about 10 per cent. raw sugar and 3½ per cent. molasses = 11 pounds sugar and 3.65 pounds molasses.

Elements of cost.	German marks.	United States cents.
1 centner beet-roots, washed and ready for cutting	1.034	24.61
Coal	0.153	} 3.90
Coke	0.011	
Muriatic acid	0.004	} 1.00
Bone charcoal	0.010	
Materials	0.023	} 2.23
Press-cloths	0.008	
Sacks	0.017	} 4.78
Limestone	0.006	
Repairs	0.005	} 6.61
Wages	0.158	
Salaries	0.043	} 0.61
Interest	0.101	
Miscellaneous expenses	0.022	} 0.17
Commissions	0.015	
Insurance	0.017	} 0.123
Wear and tear, depreciations, &c	0.123	
	1.817	43.23

"This table is made up from the carefully tested average results of three years' operations of a well-organized and successful manufactory in the northern part of Germany, and may be confidently relied on as accurate. The German Government collects a revenue tax on the value of the beet-roots after they are washed and ready for cutting. The official collecting this tax has a room in every manufactory, and superintends the weighing of the beets. As the American manufacturer will not have to bear a similar burden, this important item of cost has been omitted in the table referred to."

The yearly profit of this Industry in Germany has been 40 per cent., but last year, it is officially reported, *amounted on an average* to 100 per cent.

The League considers, however, that machinery is the pride of American ingenuity, and therefore urges the elimination of Section 2510 of the law. (See p. 1761.)

SILK.

The hopeful development of the Silk-worm cultivation and Silk reeling in the South as a new industry is set forth in the following extracts from the official works of the Department of State and Department of Agriculture, which the League begs to call to the attention of the Tariff Commission in their consideration of Schedule H.

[Extract from Consular Report No. 3, page 146.]

A suggestion or two may be made as to the extension in the United States of the culture of the silk-worm, which is so widely extended through Northern Italy. In our Middle or Southern States wherever the mulberry (*Morus multicaulis*) could be grown under favorable conditions, silk culture would be found to be profitable. It is especially fitted for adoption as an occupation to supplement income for families of small means. Here it is carried on largely by *women* and *even children*, and requires very little outlay.

[Extract from Consular Report No. 3, page 97.]

Two questions present themselves at this juncture; the first is, can we raise silk? the second, can we reel it when we have raised it? The first has already been solved; we can raise the silk-worm because we can grow the mulberry-leaf, which is its essential food. This question has been conclusively determined. Silk-worms have been successfully raised in the United States for more than thirty years. The second remains to be solved. The impossibility hitherto of competing with the cheap labor of Europe, where the silk reeler receives but 30 cents a day, and of China and Japan, where but from 6 to 10 cents is paid, has been the principal, in fact the only, cause why we have not and could not reel the silk from the cocoon. Every silk manufacturer will admit the desirability, nay, for permanent success, the absolute necessity, of having his raw material at hand, even as the cotton manufacturer has his.

To be absolved from the necessity of importing from Europe and Asia the raw material would be, next to constituting the silk industry with us, one of the great sources of our national wealth. *It would give employment to hundreds of thousands of hands, women and children, now idle or non-producing.* It would at the same time afford the masses an elegant and durable material at one-third less than the present cost; and it would give to capital a new and lucrative source of investment, shared at present but by a few individuals, and restricted to exceedingly limited proportions.

But how can we overcome the competition of Europe and Asia with regard to labor?

In the month of June last, recommended by the Department of State, which under the present administration has done so much to encourage our home manufactures and develop our foreign trade, and provided with letters by the Commissioner of Agriculture, there came to Europe a young American engineer, who, before leaving home, had already given much time and study to the subject, and who since has devoted several months to visiting and carefully inspecting the principal filatures of France and Italy. This gentleman, Mr. Edward W. Serrell, jr., of New York, believed it possible to invent machinery which, by the use and application of *electricity*, would not only overcome existing difficulties, produce a superior quality of thread, but solve at the same time the all-important labor question, and render silk-reeling in the United States as possible and profitable as anywhere else in the world.

Mr. Serrell has at length been successful, and very shortly this fact will be abundantly and incontestably proven, both for the now unhappy and rapidly declining silk-reeling industry of Europe, as well as for, from an American point of view, still more important and valuable interest, the successful planting of silk industry in the United States in all its varied stages and branches, from the mulberry tree, the *magnanerie* or hatching-house, the *reeling mill*, to a still higher perfection than what we have already attained in the fabrication of tissues. What the cotton gin has done for cotton, which with us ninety years ago hardly had a commercial value, the Serrell invention may yet do for silk, and the United States become as pre-eminent for the latter and costlier product as for the former and cheaper culture.

The capital point to be derived from these exhibits is the decline of French filatures, and to note that this decline has proceeded from (1) inferior crops, (2) decreased cou-

sumption of pure silk goods, (3) superiority of Italian filatures, (4) competition of Chinese and Japanese labor, and to add that this deplorable state could easily be revived and resuscitated by the introduction of improved and economical machinery.

And Consul Peixotto writes, of date October —, this year: "It is with pleasure that I announce the success of our young countryman, Mr. Edward W. Serrell, jr., in the discovery and successful application of automatic machinery to the reeling of Silk. This invention, patented now in all countries, will speedily enable the American people to engage in sericulture with the assurance of remuneration, and that in a few years they will be able to produce the raw material and *reel* Silk as well and as profitably as they now spin and weave it.

It is most opportune to give the views of the Agricultural Department, as prepared by Professor Riley. See also pp. 1706 and 1731.

[Extract from report of Prof. C. V. Riley, Department of Agriculture.]

That there exists just now a very general and widespread interest in the subject of silk culture in the United States is manifest from the recent large increase in the correspondence of the Entomological Division in relation thereto, and from the demand made for this Manual. To avoid the disappointment that is sure to follow exaggerated and visionary notions on the subject, it may be well here to emphasize the facts that the elements of successful silk culture on a large scale are at the present time entirely wanting in this country; that the profits of silk culture are always so small that extensive operations by organized bodies must prove unprofitable where capital finds so many more lucrative fields for employment; that extensive silk-raising is fraught with dangers that do not beset less ambitious operations; that silk culture, in short, as shown in this Manual, is to be recommended only as a light and pleasant employment for those members of the farmer's household who either cannot do or are not engaged in otherwise remunerative work.

The want of experience is a serious obstacle to silk culture in this country; for while, as is shown in the following pages, the mere feeding of a certain number of worms and the preparation of the cocoons for market are simple enough operations, requiring neither physical strength nor special mental qualities, yet skill and experience count for much, and the best results cannot be attained without them. In Europe and Asia this experience is traditional and inherited, varying in different sections both as to methods and races of worm employed. With the great variety of soil, climate, and conditions prevailing in this country, experience in the same lines will also vary, but the general principles indicated in this Manual should govern.

The greater value of labor here as compared with labor in the older silk-growing countries has been in the past a most serious obstacle to silk culture in the United States, but conditions exist to-day that render this obstacle by no means insuperable. In the first place comparative prices, as so often quoted, are misleading. The girl who makes only twenty or thirty cents a day, in France or Italy, does as well, because of the relatively lower prices of all other commodities there, as she who earns three or four fold as much here. Again, the conditions of life are such in those countries that every woman among the agricultural classes, not absolutely necessary in the household, finds a profitable avenue for her labor in field or factory, so that the time given to silk-raising must be deducted from other profitable work in which she may be employed. With us, on the contrary, there are thousands—aye, hundreds of thousands—of women who, from our very conditions of life, are unable to labor in the field or factory, and have, in short, no means, outside of household duties, of converting labor into capital. The time that such might give to silk culture would, therefore, be pure gain, and in this sense the cheap-labor argument loses nearly all its force. This holds more particularly true in the larger portion of the South and West that are least adapted to the production of merchantable dairy products or where bee-keeping and poultry-raising are usually confined to the immediate wants of the household.

The want of a ready market for the cocoons is now, as it always has been, the most serious obstacle to be overcome, and the one to which all interested in establishing silk culture should first direct their attention. Ignore this, and efforts to establish the industry are bound to fail, as they have failed in the past. A permanent market once established, and the other obstacles indicated will slowly, but surely, vanish as snow before the coming spring. Owing to the prevalence of disease in Europe, there grew up a considerable demand for silkworm eggs in this country, so that several persons found the production of these eggs quite profitable. Large quantities are yet shipped across the continent from Japan each winter; but this demand is, in its nature, transient and limited, and with the improved Pasteur method of selection, and prevention of disease, silk-raisers are again producing their own eggs in Europe. Silk culture must depend for its growth, therefore, on the production of cocoons, and these will find no remunerative sale except where the silk can be reeled. I find no

reason to change the views expressed relative to the part this Department might take in succoring silk culture through Congressional aid; for, however just and desirable direct protection to the industry may be by the imposition of an import duty on reeled silk, no such protection has yet been given by Congress, and silk filatures cannot be fully and profitably established without some fostering at the start. Under a heavy protective tariff our silk manufactures have rapidly grown in importance and wealth, until, during the year 1881 (according to the reports of W. C. Wyckoff, secretary of the Silk Association of America), raw silk to the value of \$11,936,865, and waste silk and cocoons to the value of \$769,186 were imported at the ports of New York and San Francisco, while our manufactured goods reached in value between \$35,000,000 and \$40,000,000. Now, the so-called raw silk thus imported, to the value of nearly \$12,000,000, is just as much a manufactured article as the woven goods, and its importation free of duty is as much an encouragement to foreign manufacturers and an impediment to home industry as the removal of the duty would be on the woven goods. The aid that Congress, through this Department, should, in my judgment, give to silk-reeling, and thereby to silk-production, may be supplied by private and benevolent means; and I am pleased to record, in this connection, the recent efforts of the Women's Silk Culture Association of California and the similar association in Philadelphia. This last organization has in operation a good hand-reel, worked by a skilled Italian, and the secretary, Mrs. John Lucas, offers to purchase cocoons at prices ranging from \$1 to \$1.50 per pound, according to quality. Messrs. Crozier & Co., of Corinth, Miss., and Messrs. McKittrick & Co., of Memphis, Tenn., also advertise that they will purchase cocoons at Lyons prices. These are beginnings in the right direction, but so far the efforts are warranted only in the former case through benevolent support, and in the latter as an aid to a general business of supplying eggs and mulberry trees.

The obstacles which I have set forth are none of them permanent or insuperable, while we have some advantages not possessed by other countries. One of infinite importance is the inexhaustible supply of Osage orange (*Maclura aurantiaca*) which our thousands of miles of hedges furnish; another is the greater average intelligence and ingenuity of our people, who will not be content to tread merely in the ways of the Old World, but will be quick to improve on their methods; still another may be found in the more spacious and commodious of the farmers' barns and outhouses. Every year's experience with the *Maclura* confirms all that I have said of its value as silkworm food. Silk which I have had reeled from a race of worms fed on it now for eleven consecutive years, is of the very best quality, while the tests made at the recent silk fair at Philadelphia showed that in some instances a less weight of cocoons spun by *Maclura*-fed worms was required for a pound of reeled silk than of cocoons from mulberry-fed worms.

WOOD.

The principle and policy of the League is "*true protection and justice to all American Industries,*" based upon our true conditions and possibility of future development.

In regard, therefore, to timber (Schedule K), the Commission has had two views presented; the one by Mr. Dean and others, of Chicago, who said: "The committee that were before you yesterday have already suggested that it might be well, if we are so rapidly getting out of stock, to draw our supplies from our neighbors for a while, and to impoverish them rather than ourselves"; and the other by Mr. Whittier, of Saginaw, who claims that "it is desirable to hold back the too great influx from Canada, that their great forests may be our timber preserves for use when ours are gone."

It appears so unnatural that we should consume ourselves first, and then depend upon the chance generosity of others that the free admission of timber is recommended. Canada will doubtless protect herself.

WOOL.

Regarding Schedule L the League submit the following argument in behalf of this industry, with earnest indorsement:

[A paper prepared for the Metropolitan Industrial League by Mr. E. H. Ammidown.]

The general principles which should govern and limit the rates of duty in a protective tariff are:

1. That no duties should be levied upon articles which the country is not adapted to produce with advantage.

2. That duties adequate to cover cost of production and stimulate increase of product should be levied on all articles which the country is capable of producing with reasonable advantage, and of which it does not produce enough to supply the home demand.

3. That whenever the home production of any article is equal to the consumptive demand the duties on that article should never be insufficient to protect the cost of it, but may without detriment be very much higher than is sufficient to protect cost, inasmuch as competition among producers is in such cases enough to prevent the article from advancing far above cost, no matter what the rate of duty may be, and may often reduce the price below cost.

If these principles be applied to the wool-growing industry, we should conclude that upon such classes of wool as cannot be produced in this country with reasonable advantage there should be no duty. Very few kinds of wool would be found to come under this head—possibly some of the long and coarse carpet wools from Southern Russia, the borders of the Black Sea, and Central Asia, Northern Africa, and South America. These wools, under the existing tariff, would generally come under the 3 cents per pound duty, though some of them costing over 12 cents per pound would come under the 6 cents per pound duty. A critical examination might show that some of these wools could be produced advantageously here, and on such wools, which would be of the better class, the 6-cent duty should be retained.

In respect to all other wools it is safe to say that they may, with rare if any exceptions, be produced here advantageously. If any special kind of clothing or combing wool cannot be raised here, it is either very unimportant or a substitute for it may be found among our own wools. The capacity of this country to produce nearly all the wools we require except certain classes of carpet wools is shown by the statistics of our wool importations. In 1881, for instance, there were withdrawn for consumption from the custom-houses of Boston, New York, and Philadelphia about 58,000,000 pounds of foreign wool. Of this 45,000,000 were carpet wools, and of the remainder about 11,000,000 were clothing wools and about 2,000,000 combing. About 80 per cent. were carpet wools. If we assume that the consumption of wool in the United States is represented on an average by the quantity produced added to the quantity entered from abroad for consumption, during any one year (which assumption is justified by the statistics of the wool trade for many years past), we find that in 1881 the country required for its wants: Foreign carpet wools, 45,000,000 pounds; foreign combing wools, 2,000,000 pounds; foreign clothing wools, 11,000,000 pounds; domestic wools, 290,000,000 pounds. Excluding the carpet and combing wools, it appears from these figures that the country required of foreign wool for clothing purposes a quantity less than 4 per cent. of the total domestic clip. In other words, an increase of 4 per cent. of our domestic wool product, if of the quality of these 11,000,000 pounds imported, would have fully supplied the demands of our home manufactures. The clip of 1882 is estimated at 320,000,000 pounds, or an increase of 10 per cent. on the clip of 1881; so that unless the home demand has largely increased since last year we are already producing more than enough to supply it.

If the importation of 11,000,000 pounds of foreign clothing wools used indicates that we are deficient in the production of these special kinds of wool, it is evident that the second principle laid down at the beginning of this review should be applied in determining the duty on them, provided it appears that this country can produce such wools advantageously. It will be found that these 11,000,000 pounds entered for consumption in 1881, and the importations generally of clothing wools are chiefly Cape, Australian, Montevideo, and corresponding qualities of fine wool. Can we produce them with such a degree of advantage as to justify protecting the growers? Undoubtedly we can, and we are producing such wools both North and South. Formerly Western Pennsylvania, Virginia, and Ohio monopolized the product of these finest wools. But within a few years Texas and the Southwestern Territories have begun to send them to market, and are now producing them in such considerable quantities that there can be no doubt whatever that if we are not now producing enough of these qualities to supply the demand, the encouragement afforded by protection will very soon lead to an adequate supply, and develop a production which, by competition, will regulate prices so as to insure as low a price as the cost of production will admit.

On this class of wools, therefore, a duty should be levied high enough to protect cost of growing and encourage an increase of production, so as ultimately to supply the demand and bring about competition among the growers for the sale of their product. What the rate of duty should be may be determined by observing the current prices of such wools here as compared with prices of corresponding wools in the London market; and taking into view also any peculiar conditions temporarily affecting either the home or the foreign price. The price of foreign fine wools does not seem to be influenced at this time by any unusual conditions. The supply and the demand are both large and steady, increasing regularly with the growth of population and wealth. American fine wools have, on the other hand, been seriously affected, as to value, by the universal demand in this country for rough and medium fabrics for men's clothing, and the absence of any general demand for fine wool fabrics either for men or women. Recently there has been perhaps a growing inquiry for the finer kinds of woollens for women's use, and this may increase to such an extent as to bring the finest wools into greater demand. But for some time past the finest wools have been

cheaper in proportion than medium grades, for the reason just stated; and it would not be quite just to assume that growers of fine wools have been satisfied with the prices they have been getting. Yet, as the product becomes more largely Southern, it may be assumed that the cost of growing will be less; it is now on an average quite a percentage less than it was a few years ago. It would not therefore be far out of the way now, and surely, a few years hence, not at all out of the way, to assume the current prices as reasonable ones for the fine wools of this country, and that if protected on that basis the growers would increase their production, so as to supply the demand of our home manufacturers to any required degree, within a very few years at the farthest.

Upon comparing the current rates of such wools with the prices of similar foreign wools in London, it will be found that the American wools are selling here at 8 to 10 cents per scoured pound lower than similar foreign wools can be landed with duty and charges paid. This 8 to 10 cents per scoured pound of Australian, Cape, and similar wools is equal to about 3 to 4 cents on the wool in the grease, as it usually comes to market; this difference is about 10 per cent. on the foreign cost of such wools, so that the duty might be reduced 10 per cent. on such wools without injury to the American grower, and still leave him the protection needed to encourage and develop his business. On such wools, therefore, I would advise that the 10 per cent. ad valorem duty now levied be abandoned.

Medium wools have for many years constituted by far the largest part of the wool used in this country.

Very few of the active men of our day have ever worn broadcloth or fine-faced fabrics, except on ceremonious occasions, at weddings and funerals, balls and dinner parties. For such uses one suit of clothes will serve for many years, and our manufacturers have, with few exceptions, ceased making goods for which there is such a small demand. Other fabrics, in which extra fine wools are used, are also in limited demand. Hence the general inquiry has been for medium wools, and wool-growers responding to it have given their attention chiefly to the growth of this class of wools, and have realized for them larger profits than they would have got from fine wools. But the demand has hitherto kept pace with the increasing supply, so that to-day, with an enormous enlargement of the product, the price still remains higher in proportion to cost than the price of finer wools. How long this peculiar state of things will continue cannot with certainty be predicted; but there are indications that the supply is now equal to the demand, and may soon exceed it. It is certain that the larger profits of medium wools will at last cause excessive production and depress their value to a fair point relatively to fine wools. Hence, in estimating the rate of duty which these wools require for their protection, we may safely place the cost of producing considerably lower than the market prices of these wools, taking into view the quantity produced, would lead us to suppose it to be; from the prevailing high prices of medium wools it is also evident that the supply has not yet so far overreached the demand as to induce effective competition among the growers, and that the influence of competition with foreign wools is still useful to prevent excessive prices.

Assuming, therefore, that the present rates for medium wools are unnaturally high, and that the difference between the scoured cost of these wools and foreign wools landed here should not vary far from the difference in cost of our fine wools and foreign fine wools landed here, and assuming also that the actual variation of these differences due to excessive demand for medium wools will before long be overcome by an augmented supply of medium wools, it is safe to say that the ad valorem duty of 11 per cent. on medium wools may be abandoned without serious injury to the American grower at the present time, and with considerable advantage to him in the long run. This operation of this advantage will be hastened by the same influences which tend to lower the prices of American fine wools, viz, the rapidly increasing product of both fine and medium wools in the southern parts of the United States, where the climate allows the sheep to pasture the year round, with little or no expense either for shelter or food. In view of this circumstance, the Northern wool-grower should see it for his interest not to stimulate the growth of wools in our warmer latitudes by excessive duties on foreign wools. The inevitable result of competition between the Northern and Southern wool-growers will ultimately diminish the Northern product and increase the Southern, where it is most profitable, and it is for the interest of the Northern wool-growers not to hasten this conclusion by unnecessary protection.

The same general principles may be applied to determine the duty required on combing wools.

In view of the foregoing considerations, and of the importance of simplifying the tariff whenever practicable, the following amendments to the schedule of duties on wool are suggested:

1. Abolish the 3 cent duty and admit free all carpet or other similar wools not grown, or which cannot be advantageously grown, in this country.
2. On all carpet or other similar wools, washed and unwashed, which may with

reasonable advantage be grown in this country, levy a duty of 6 cents per pound, or, when scoured, 15 cents per pound.

3. On all kinds of unwashed clothing and combing wools levy a duty of 11 cents per pound, and 22 cents per pound on this class of wools when washed; and on scoured wools of this class, 33 cents per pound.

NEW YORK, October 5, 1882.

CHEMICALS.

CASTOR OIL.

Sustaining the recommendation made on page 1708, and in further explanation thereof, the following particulars are herewith submitted by the League asking the careful attention of the Commission thereto, and also to the revised rate, pages 1740-1742.

[Paper of Messrs. H. J. Baker & Brother.]

NEW YORK, September 8, 1882.

Mr. CHARLES S. HILL,
Metropolitan Industrial League:

DEAR SIR: We are interested in the manufacture of castor oil, having erected works some years ago, at an outlay of over \$100,000, with the expectation that a fair protection would be accorded us as against the very cheap labor of East India, the great foreign seat of castor oil manufacture, and would state that this industry, while comparatively speaking not a large one, has grown under the favorable conditions of the present tariff, until now the entire consumption of the United States is supplied by castor oil made in this country, from machinery made here.

The capital invested in the plant for the manufacture of the oil, &c., is some \$850,000, and unless a liberal protection is granted the manufacturer of castor oil in this country, the business would be entirely destroyed, and the factories and machinery rendered worthless by reason of the superior facilities which foreign manufacturers of castor oil enjoy, and which would enable them to deliver their oil in this country at a price which would drive the American oil from the market, and ruin the domestic industry, after which accomplishment the foreign manufacturers would doubtless advance their prices so that castor oil would cost our home consumers much more than it does now, this being a very common proceeding with foreigners when they have once obtained control of our markets.

The disadvantages under which American manufacturers of castor oil labor, as compared with foreign manufacturers, are many. In the first place labor in East India, where the oil is made, is from 3 to 6 annas per day (9 to 18 cents), while we pay \$1.75 to \$2 for ordinary hands, and from \$5 to \$8 for foreman, &c., or some 1,500 per cent. more than the foreigner pays.

Again, in freighting the crude material (castor seed) from East India, the principal place whence it is imported, we are compelled to pay freight on the castor seed, while they freight the oil itself. As the oil is only about one-third of the substance of the seed, it will be seen at once that we have to pay freight on three times the quantity of material (seed) which the foreign manufacturer has to pay on, in laying down the same quantity of oil in this country.

Further, we pay a considerable duty on the tin from which we make the cans to hold the oil, while the cans which contain imported oil pay no duty whatever.

The mere fact of there being a duty on castor oil sufficient to keep foreigners from crushing this domestic industry does not compel the consumers in this country to pay a high price for their oil, home competition preventing anything but a very moderate percentage being realized from the business. As proof of this statement, we would state that although the duty is and has been \$1 per gallon, the average price at which domestic castor oil has been sold in this country for the past six years is \$1.02½ per gallon. The average price for each year being as follows:

	Per gallon.
1876	\$1 02½
1877	1 11
1878	99½
1879	1 18
1880	89½
1881	96

So that it is at once manifest that, while the duty has kept foreign castor oil out of our market, the consumers have not had anything to complain of. And yet, although the taking off of the entire duty on castor oil would cause our American mills to close their doors and throw their workmen out of employment, we could still manufacture at a moderate margin of profit if the duty were reduced to 60 cents per gallon, provided castor seed is admitted free, or at a duty not exceeding 20 cents per bushel, and we

would therefore urge the propriety of reducing the duty on castor oil to 60 cents per gallon, and castor seed or beans to 20 cents per bushel of 50 pounds.

The foregoing will give you the principal points on which we base our views, and we trust they are in such shape that you may be able without any difficulty to embody the main points in your manuscript.

Very truly, yours,

H. J. BAKER & BRO.

SOLUBLE OIL.

Referring to pages 1679 and 1680, where complaint is made as to the faults in Enumeration, the League offers the following evidence as one instance of the troubles arising therefrom:

To the Metropolitan Industrial League, New York:

GENTLEMEN: As manufacturers of soluble oil, we would respectfully call your attention to the disadvantages under which we labor, and also to the amount of duty the government loses, to which it is justly entitled, by reason of the importation of this article at a rate of duty much less than its constituent parts would pay.

Permit us to state that the manufacture of this important article in this country is almost entirely destroyed, and that of foreign countries stimulated, by allowing it to come in at a rate of duty so much less than that which applies to the materials of which it is composed. Being soluble in water, it is used extensively in printing and dyeing, and is composed of castor and other oils (usually averaging 50 to 70 per cent. of the article), the remainder being oil of vitriol, aqua ammonia, and water. It is imported under various names, viz: alizarine assistant, dye assistant, oleine, soap liquor (which is on the free list), soluble oil, turkey red oil, paying but 20 per cent. duty ad valorem.

In 1881 there were imported into this country about 1,200,000 pounds, or some 150,000 gallons.

The duty on the castor oil contained in the quantity (some 75,000 gallons), at the present tariff on castor oil (\$1 per gallon), would be \$75,000. The duty actually paid was about \$9,600, thus depriving the government of some \$65,000 revenue, to which it was entitled, in addition to crushing the industry in this country by thus protecting the foreign manufacturers of this article at the expense of our domestic manufacturers.

To remedy this evil we would respectfully advocate the adoption of the following clause in the tariff: "That the article known as soluble oil, alizarine assistant, dye assistant, oleine, turkey red oil, or any similar compounds, by whatever name they may be known, shall pay the following duty: 35 cents per gallon when containing 50 per cent. or less of castor oil and other oils, and a pro rata increase when the percentage of oil in the compound is increased."

This percentage of oil can be very easily determined. We would call your attention specially to the sentence above, "or by whatever name it shall be known," as it would be useless to provide for the above duty on the names of the article as mentioned above, as the foreign manufacturers would simply bring it into this country under some newly invented name, in order to avail themselves of the 20 per cent. ad valorem duty.

In order to prevent the future importation of this and similar articles by foreign manufacturers to the detriment and loss to the government and our domestic manufacturers, we would earnestly advocate the insertion after Schedule M of the following clause: "Any non-enumerated article, being composed wholly or in part of any article embraced in Schedule M, shall pay the same rate of duty as is chargeable on that constituent part paying the highest duty."

 F. D. EATON, *Swansea, Mass.*

GLYCERINE.

Under the same schedule, the League asks consideration of the following:

[Paper of Messrs. Marx & Rawolle.]

Respecting proposed changes and revisions in the existing tariff, we respectfully desire to call your attention to the article of *glycerine*, in which we are largely interested as refiners and distillers and importers of the crude material from Europe.

Crude glycerine is mostly obtained at present as a secondary or by-product in the manufacture of stearine candles. A small quantity (since January 1, 1881) has also been made from soap lye waters; and various other (hitherto mostly unsuccessful) attempts have been made to extract the crude glycerine from fats and oils, before the latter have been converted into soap and other articles. Crude glycerine as thus made is

of various shades of brown or dark yellow color; whereas, manufactured glycerine is either white or light yellow color, although if badly or imperfectly refined and distilled it may even be of a brown color; or manufactured glycerine may be artificially colored, like sugars. Hence, neither color, nor specific gravity, nor both, are sufficient criterions to distinguish crude from manufactured glycerine.

Our business consists in refining and distilling the impure crude glycerine, and producing the pure white and yellow glycerines for drugs and manufacturing purposes. The crude material we buy from the stearine candle manufacturers, partly in this country and partly in Europe, more than 80 per cent. of all the crude glycerine that we have worked at our factory.

The domestic stearine manufacturers produce only about one-third of the total consumption of glycerine in this country. On the other hand, the domestic glycerine refiners have more than ample capacity and machinery to produce all the manufactured glycerine from the crude required in the United States. For the above reasons we are unable to buy all our requirements of crude glycerine in this country at any price.

The present duty is 30 per cent. ad valorem, being the same on both crude and manufactured glycerine. This is unfair and unjust, because it gives no protection to us refiners.

In changing the present ad valorem duty we think that the total duty to be collected by the government will remain about the same, without any material increase or reduction, because the amount of duty at the proposed specific rates will and can be collected more efficiently and correctly.

We propose a specific duty of 2 cents per pound on crude glycerine, and 5 cents per pound on manufactured glycerine.

Crude glycerine is defined to be of a brown or yellow color, of 1.2500 specific gravity or less (at the standard temperature of 60° Fahr.) as directly extracted from fats and oils by the stearine-candle, soap, and other manufacturers, without having been subsequently purified by the process of refining, distilling, or both.

Manufactured glycerine is defined to be white glycerine of any gravity, and brown and yellow glycerine of more than 1.2500 specific gravity, and any glycerine of any gravity which has been wholly or partly refined or distilled.

We desire to change the present ad valorem into a specific duty, because:

1st. The difficulty and almost impossibility of determining the foreign market value of glycerine.

2d. The injustice of the present law, which compels us (when we have been so fortunate as to buy at low prices) to add value in order to make market value, and to pay duty thereon; but, on the other hand, when we are unfortunate to buy at high prices, and market value becomes lower than our contract prices, we are compelled to pay duty on our contract prices and not on market value. This is a poor law, which does not act both ways, and from which we have been suffering for some time past, and thus doubly increasing our misfortune, when losing money on depreciation of our goods. To this matter of market value we would specially and urgently call your attention.

3d. To protect ourselves and the government against frauds by undervaluation.

4th. The present inadequate and almost entire want of protection in the duty on manufactured glycerine, because, as before stated, the present ad valorem rate of 30 per cent. is the same on both crude and manufactured glycerine.

We propose a specific duty of 2 cents per pound on crude glycerine, so as to give fair protection to the stearine-candle manufacturers, who at present are the only ones producing crude glycerine in this country.

As a matter of course, a duty on crude glycerine makes necessary a duty on manufactured glycerine, and this latter should be at least 5 cents per pound, or, say, at least 3 cents per pound *more* than the former, because—

1st. The extra cost and labor to make the manufactured glycerine, our rents, wages to laborers, salaries to clerks, interest, many and expensive repairs to machinery, and general expense for conducting business, are fully double what they are on the continent of Europe, from whence about 99 per cent. of the manufactured glycerine is imported.

2d. There is a wastage of about 25 per cent. in producing the manufactured from the crude glycerine, and on which wastage we have to pay duty. This is an important item and must not be overlooked.

3d. The freight, insurance, and banking commission which we have to pay on this 25 per cent. wastage.

4th. The greater cost in this country than in Europe of the packages in which manufactured glycerine is imported, such as glass bottles, tins, and cases.

5th. The great advantage which the foreign refiner has over the domestic one; the former, being on the spot in Europe, is naturally able and does buy his crude material cheaper than we American refiners can buy it there.

During the past eleven years, from 1871 to 1881, inclusive, the average price, free on

board, European port, was, for crude glycerine, 75 francs per 100 kilograms, and for manufactured glycerine 160 francs per 100 kilograms.

The duty on said crude was 75 francs \times 19.3 cents (220 pounds \times 30 per cent.) = 1.974 cents per pound.

The duty on said manufactured was 160 francs \times 19.3 cents (220 pounds \times 30 per cent.) = 4.211 cents per pound.

However, during the year 1881 the average paid was, for crude glycerine, 155 francs per 100 kilograms, and for manufactured glycerine 215 francs per 100 kilograms, yielding a duty on said crude of 155 francs \times 19.3 cents (220 pounds \times 30 per cent.) = 4.079 cents per pound, and a duty on said manufactured of 215 francs \times 19.3 cents (220 pounds \times 30 per cent.) = 5.658 cents per pound.

During the eleven years 1871 to 1881, inclusive, the difference in the duty between manufactured and crude glycerine was 2.237 cents per pound, whereas in 1881 this difference was only 1.579 cents per pound and there is every reason to believe that in future this difference will become still smaller, and consequently the present ad valorem duty will even be less adequate as a protection on manufactured.

To prove how the tariff affected us in 1881, we give the following detailed calculation:

	Per pound.
25 per cent. wastage on duty of 4.079 cents per pound on crude.....	\$1 02
25 per cent. wastage on freight, 10 cents; insurance, 2 cents; and banking, 3 cents	15
Difference of labor and expenses.....	2 28
Total	3 42
Difference in duty between manufactured and crude glycerine in 1881 was.....	1. 579
Loss to American refiners.....	1. 841

As before stated, if the specific duty on crude glycerine be 2 cents per pound, then there should be at least 3 cents per pound more, or 5 cents per pound total duty on manufactured glycerine, which difference of 3 cents per pound we calculate as follows:

	Per pound.
25 per cent. wastage on duty of 2 cents per pound on crude.....	\$0 50
25 per cent. wastage on freight, insurance, and banking.....	15
Difference of labor and expenses.....	2 25
Margin for the American refiner.....	10
Total	3 00

Not including difference in cost of packages, and not including the great advantage the foreign refiner has over the domestic one in being able to buy his crude glycerine cheaper in Europe, as before explained.

We also wish to call your attention to the present law of duty on *packages*. A part of the crude glycerine which we import is in old petroleum barrels, for which no charge is made, and on which we consequently pay no duty, but the larger part of our importations is made in iron drums (made at Paris, France), so as to avoid leakage, and on which drums we pay duty. Now, as we receive many more of these iron drums than we can sell here, and so as to utilize them, we have for some time past shipped back these drums, when empty, to Europe, there had them refilled with glycerine, and then again reshipped such filled drums to New York, and each time we have been obliged to pay duty over and over again, which we do not think is just. Hence, we propose that foreign packages on which duty has been once paid shall have the privilege of being sent back to Europe, and thence reshipped to this country time and again, without being obliged to pay duty a second time, by keeping a proper account and registry at the port of entry.

If our above proposed change of the present ad valorem duty into a specific one be not accepted by you, then we desire that the present ad valorem duty of 30 per cent. on both crude and manufactured glycerine be changed to 15 per cent. ad valorem on crude glycerine, and 35 per cent. on manufactured glycerine, so as to give us refiners in the United States the necessary and required protection on our manufactured glycerine. And further, that said new proposed ad valorem rates be levied on the market value in Europe, at the place where such goods are produced (and not at the port of shipment), no matter if the purchase or contract price actually paid be above or below such market value.

Lastly, by the present law we are obliged to pay duty also on 3 per cent. commission added, and whereas we buy our goods at net prices, all charges and commissions included, we think that it is unjust to compel us to pay duty on commissions which we do not actually and really pay. We therefore suggest that this law be changed, and that in future duty shall only be levied on commissions when they are actually paid by the importer on his purchases, and that no duty shall be levied where such purchases are made at net prices, in which all charges and commissions are included.

To recapitulate, we propose—

- 1st. Specific duty of 2 cents per pound on crude glycerine.
- 2d. Specific duty of 5 cents per pound on manufactured glycerine.
- 3d. Foreign packages on which duty has been once paid, when shipped back to Europe, and thence reshipped to this country, shall be free, and shall not pay duty a second time.

4th. Ad valorem duty shall be levied on market value in Europe, no matter if the purchase price paid be above or below such market value.

5th. No duty shall be levied on commissions, no matter whether such commissions be actually paid by the importer on his purchases or not.

We think that the above proposed changes in the present tariff are fair, just, and equitable, and will meet with the full and cordial approval of all interests concerned.

We remain, very respectfully, your obedient servants,

MARX & RAWOLLE.

NEW YORK CITY, *October* , 1882.

LEAD PENCILS.

In justice to a new and remarkably developed Industry, the League recommends the following revision under Schedule of Sundries :

[Letter of the Eagle Pencil Company.]

NEW YORK, *October 24*, 1882.

C. S. HILL, Esq.,

Statistician for the Metropolitan Industrial League :

SIR: At our late interview you informed me that it was proposed to change the present duty on lead pencils, viz, 50 cents per gross and 30 per cent. ad valorem, to 50 per cent. ad valorem, in accordance with the intention to simplify and reduce the present tariff, where practicable, from specific and ad valorem to either a specific or ad valorem duty.

I had at that time the pleasure of submitting to you that the present duty on lead pencils is an equitable one, and as low as German hand labor will permit the existence of this industry in the United States. Also, that an ad valorem duty of 50 per cent., while sufficient protection for high-priced goods, would not be for low-priced goods to compete with those of German manufacture.

After due consideration, I am of the opinion that a specific duty should be substituted, and of \$1 per gross, amounting, in fact, to about 50 per cent. ad valorem (as per statement below), as proposed by you, and, while protecting the cheaper grades, will be less excessive to the higher grades than an ad valorem rate of 50 per cent.

STATEMENT.

	Per cent.
50 cents per gross + 30 per cent. ad valorem	56
50 cents per gross	26
\$1 per gross specific	52

SALT.

Considering the great importance of this Industry in the manufacture of pure Salt in our country, to relieve our dependence upon a foreign article and for our protection against an impure article, the League indorses the following :

[Paper of the Salt Association.]

SYRACUSE, N. Y., *September 30*, 1882.

To Mr. E. H. AMMIDOWN,

Chairman Tariff Committee Metropolitan Industrial League :

DEAR SIR: Pursuant to request of the Metropolitan Industrial League, we submit the following concerning salt.

In 1872, just prior to the last reduction of the tariff on salt, there were in Syracuse and vicinity 316 boiling salt blocks, whose market value on an average was \$10,000 each, which were doing no more than a fairly remunerative business.

Three-fifths of this number were owned by persons of moderate means. The effect of the reduction of the tariff was to extinguish three-fifths of the fires of the boiling blocks or works, and to render them valueless except for old material, on which their owners realized not more than from 5 to 10 per cent. of their original value, which brought all manufacturers of small means to poverty, and threw out of employment thousands of skilled laborers in the various branches of the business.

The large capitalists, consisting of nearly two-fifths of the whole number, have kept

their works in running order but without remunerative results, in hopes that the former tariff would be reinstated in time to save the utter destruction of their property invested, the market value of the money invested in salt works in 1872 being \$6,000,000, and the present value, according to United States Census, 1880, \$2,286,081, showing a depreciation of \$3,713,919.

During the eight years just prior to the tariff which went into effect in 1874, *i. e.*, 1866 to 1873, inclusive, the amount of boiled salt made was, in bushels of 56 pounds each, 47,935,647 bushels, and in the eight following years, 1874 to 1881, 36,011,970 bushels, a decrease of 11,923,677 bushels.

Wages, solar salt works.—Superintendent, \$3 per day; foreman, \$2. per day; other men, \$1.63 per day, with house rent.

Boiling works.—Superintendent, \$3 per day; other men, \$3 per day.

It should always be remembered that our season does not exceed six months per year.

The cost of our salt at New York and New England ports is 14½ cents per bushel; cost of foreign salt is 7.02 cents per bushel, showing that we should have a duty of not less than 7 cents per bushel of 56 pounds, or 12½ cents per 100 pounds in bulk, and 11.2 cents per bushel, or 20 cents per 100 pounds in packages.

A comparison of the report of the United States Bureau of Statistics for 1881, printed in 1882 with the official report of the Bureau of Fisheries, shows as follows:

The amount of foreign salt withdrawn from the custom-houses free of duty, ostensibly for curing fish, in 1881, was 133,395,065 pounds, or 2,382,054 bushels of 56 pounds, while the amount actually used for curing fish in 1881 was 76,513,920 pounds, or 1,363,203 bushels, leaving yet unaccounted for 1,018,851 bushels, on which no duty was paid and which was not used for fish curing—robbing the government of \$45,504.91, and demoralizing the markets for our salt.

It is not clear to us that salt should be admitted for curing ocean fish free of duty, both on account of this fraud and of the interests of our lake fisheries.

We urge a reimposition of duties on salt used for curing fish. We can fully and abundantly show that our salt much more perfectly preserves fish than any foreign salt used for that purpose.

The total salt used in the United States is 49,025,226 bushels; of this, 60.78 per cent. is made in the United States, and the other 39.22 per cent. is imported.

The Michigan salt manufacturers not only pay nothing for fuel used in making their salt, but are actually benefited by having the *debris* of their saw-mills thus burned out of their way, which otherwise would be removed at a very considerable expense.

In the case of war, New England and the eastern seaboard would be dependent on Onondaga salt works for their supply of salt, which, on this account, should be especially favored and extended, and kept working to their full capacity.

As to quality of our salt, we fear no competition. It is unsurpassed in purity and adaptation to various purposes for which salt is used.

ONONDAGA COUNTY SALT ASSOCIATION,
AMERICAN DAIRY SALT COMPANY,
NEW YORK SALT COMPANY, SYRACUSE, N. Y.

We respectfully request that with other American industries our manufacture may receive that care and protection which, whenever exercised in the past, has ensured to the great prosperity of our country, while an occasional opposite policy, history says, has materially retarded our great advancement as a nation.

Committee on the part of the Salt Producers of Onondaga County.

SYRACUSE, October 4, 1882.

NEW YORK STATE DAIRYMEN'S ASSOCIATION.

At the last convention of the New York State Dairymen's Association, held at Whitney's Point, December 20, 21, and 22, 1881, the Committee on Salt, composed of fifteen, unanimously reported as follows, and the report was unanimously adopted:

Resolved, That we consider the Onondaga F. F. Salt, manufactured by the American Dairy Salt Company, L., Syracuse, N. Y., at least equal to any dairy salt of foreign manufacture; and as it is cheaper, is warranted equal in purity to any, and is not

exposed to the filth and odors of the English and American docks, besides being a home product, we commend its use to all dairymen.

JESSE OWEN,
S. HOXIE,
E. C. CRAFTS,
W. S. JENKS,
G. P. SQUIRE,

At Delhi, December 22, 1880, the following preamble and resolution were unanimously adopted by this association:

Whereas, It has been asserted that foreign salt is absolutely necessary to the manufacture of fine butter and cheese in America and for packing purposes, and on this assumption the agents of the foreign salt interest demand that foreign salt shall be put on the free list; and

Whereas, Both science and practice demonstrate that American salt, for the specific purposes for which it is manufactured, is equal if not superior to the corresponding brands of foreign salt to be found in our markets; and

Whereas, Any reduction of the present tariff on salt would strike a ruinous blow to a large State interest and to one of our most important American industries; and

Whereas, The government must have revenue, and the salt interest and all its tributary branches of industry are entitled to equal protection with all other branches of American industry; and

Whereas, To put salt on the *free list* would not only be disastrous to a great American industry, but would place the dairymen and consumers of salt generally at the mercy of a foreign monopoly, while such healthy competition as would be secured by a tariff on salt that would produce the most revenue would be beneficial to all classes of consumers; and

Whereas, The American salt interest will be satisfied with a tariff on salt which will produce the *largest revenue*; therefore,

Resolved, That we, the members of the New York State Dairymen's Association, respectfully recommend and petition Congress to place such a tariff on foreign salt as shall produce the maximum of revenue to the government.

Similar resolutions were also passed by the American Dairymen's Association, the Saint Lawrence County Dairymen's Association, the Pennsylvania State Dairymen's Association, the Otsego County Dairymen's Association, and the Delaware County Dairymen's Association.

OUR PAST TARIFF CONDITIONS.

1842-1882.

So much misapprehension or misrepresentation exists relative to our past Tariff conditions and influence thereof, that it is well here to present a comparison of such for the last *four decades* to enable the Commission to recognize facts from mere assertion, and to see upon what policy, in the several periods of our history, our Industries have been built.

N. B. This comparison appears with the additional column of our present Tariff rates (1882) in "Tariffs of the World and Analyses Thereof," D. Appleton & Co., but is omitted here for want of space, and as the same appears in the full with proposed revised rates of the League on pages 1711-1763.

GREAT BRITAIN'S POLICY AND TARIFF CONDITIONS.

From the date of the first Tariff of the United States (1789) to 1859, Great Britain was more severely protective in an economic policy to her Industries—of eight hundred years than the United States in our policy to our new born and limited Industries. The abolition of the “Corn Laws,” in 1846, was positively a necessity for subsistence, and hence not a question of Revenue nor of Industrial development. It was a necessity from the barrenness of the soil, therefore *absolutely protective at home*. The Diagram pages preceding illustrate the extreme converse conditions of our country and necessity for converse economic laws. With such consideration, political influences have no association whatever, but interrupt the true interests of a people. The consideration is one purely of conditions—not the application of “universal principles.”

For fifteen years after the abolition of the Tariff on breadstuff, or “corn laws,” Great Britain continued a heavy Tariff in protection over her Industries, and it was only when the wonderful development of her power from manufacturing Industries and her iron resources that she saw her independence of the world, and her ability to open her ports freely to articles in which she had no competition, and with fear of injuring her Industries of eight hundred years' development.

In proportion to the development of an Industry is the wisdom of removing protection.

In evidence therefore of the fore-sighted policy of Great Britain and of her gradual and guarded action, the following comparison of her past Tariffs are submitted to the Commission:

British Tariff Conditions.

Articles.	Rates of duty.		
	1787.	1819.	1859.

of a similar nature, and subject to the same rate of duty, are classed under one head. Duties was 53 in May, 1875, as compared with 397 in 1859 and 1,046 in 1840. (British abstract, 1882.)

INTERNAL REVENUE.

The great importance of wise action in this branch of Taxation, and especially as to Spirits for manufacturing purposes, calls for a recommendation by the League; with a desire, therefore, to submit this subject clearly, the following opinions are presented:

[Letter of Mr. W. A. Gellatly, of the firm of Messrs. Schieffelen & Co.]

WHY ALCOHOL USED FOR CHEMICAL AND PHARMACEUTICAL PURPOSES SHOULD NOT BE TAXED.

1. Because English and German chemical manufacturers are able to buy alcohol duty free, *i. e.*, at actual cost.

2. In the preparation of many fine chemicals the use of alcohol is necessary in order to insure a pure product. (Instance many of the expensive alkaloid's, as atropia; many salts, as iodide of ammonia; many preparations, as iodoform, chloroform, ether, &c.)

3. In the performance of the necessary manipulations much alcohol is lost through evaporation. In many cases this loss of alcohol is a greater item of expense than is the cost of all other materials, apparatus, and labor.

4. In many tinctures and fluid extracts the alcohol, necessarily used simply as a solvent, adds more expense than the total value of drug and labor. What should usually be considered a less important ingredient, a mere solvent, becomes actually the most expensive substance in the compound.

5. From what has been stated above it appears:

(a) That the excessive tax on alcohol entirely prohibits the manufacture in this country of many of the finer chemicals and gives the whole trade to German and English manufacturers.

(b) The cost of American-made chemicals in whose preparation alcohol must be used is artificially enhanced by the exorbitant tax on alcohol. Often the cause for the high cost of these articles is not apparent to the purchaser, because the alcohol used does not appear in the finished product, but has been lost through evaporation during the preparation of the substance.

6. Alcohol is necessary in the preparation of most medicines; there is no known solvent which can replace it. As a rule its office is that of a solvent for the extraction and preservation of valuable medicinal ingredients of drugs.

These medicines are used and must be paid for by the sick, *i. e.*, by those least able to pay exorbitant prices. The excessive tax on alcohol does, however, make the cost of many medicines very heavy, far more heavy than is just and right. The tax on alcohol used for these purposes is accordingly a very heavy and unjust tax imposed upon a legitimate industry (manufacturing chemistry and pharmacy), and it is also a heavy tax on individual users of medicines.

Medicines should not be excessively taxed like luxuries; they are necessities.

The entire removal of the tax on alcohol used for these purposes is desirable and proper, but the immediate removal of the tax would result in financial disaster in thousands of cases, for the reason that all over the country various dealers have in stock considerable amounts of goods manufactured with alcohol which has paid this excessive tax. These goods have cost, consequently, much higher prices than they could be replaced for if free alcohol were used.

If a law be enacted which names a date, six months or a year in advance, when the tax shall be reduced say 10 or 20 per cent., and which makes provision for future annual or semi-annual reductions until alcohol is tax-free, there need be no fear of serious commercial disturbance. Such a revision of the law would result in stimulating and greatly expanding our chemical manufactures.

At present the value of a barrel, of forty gallons, of alcohol is approximately—

Cost of forty gallons of alcohol	\$21 92
Tax	67 68
Total	89 60

One hundred and eighty-eight degrees overproof alcohol is worth to-day about \$2.24 per gallon, \$89.60.

As appears above, fully three-fourths the cost of every barrel of alcohol is due to the internal revenue tax.

Were coal thus taxed the value of iron and steel would be so enormously enhanced as to prevent their use in any but the smaller and finer tools, while iron rails and iron steamships, to say nothing of steel would be impossible.

Manufacturing chemistry and pharmacy are just as heavily hampered, just as truly restricted and dwarfed by the excessive duty on alcohol as would be the iron industry were the tax on coal to be placed at three times its actual cost.

And in further evidence, the League cannot present the matter better than by indorsing the words of Mr. Goldsborough Robinson, of Kentucky, whose knowledge and judgment in this matter is pre-eminent:

"Alcohol is nature's great solvent, and is required in nearly all industrial pursuits. In this use it is as absolute a necessity as machinery or a paint-brush, and in taxing it we tax a product of our own industry, and through it lay a burden upon our own manufacturers.

"The tax is so excessive as to be almost prohibitory, and our people are placed at a great disadvantage in competition with those of foreign countries who have free alcohol.

"No government, wisely conducted, will levy excessive taxation on its own industries.

"This principle is so well established that machinery is in many cities exempt from local taxation.

"The only justification of the extreme tax on spirits (it is six times their value) is the popular belief that they are harmful luxuries, and should therefore bear the burden, but this justification fails utterly where spirits are used in manufactures, in the preparation of drugs, as a burning fluid, and in all the common wants of the people. This tax being almost prohibitory every shift has been adopted to escape its burden; benzine (dangerous always) is substituted as a burning fluid, and fusel oil (a poison) as a solvent.

"All inventions leading in the direction of the use of alcohol are barred. It has great bleaching powers, and might be employed with advantage on textile fabrics; but its cost prevents any experiment in this direction. For nearly twenty long years—the most progressive years in the world's history—the American people have been practically deprived of the use of this great solvent. Its absolute necessity in scientific pursuits has been admitted, and colleges have been granted, by special enactment, its use without tax; but no provision has been made for that army of humble laborers in the scientific fields, to whose efforts all our great inventions are due and who have no access to college laboratories.

"The constantly increasing surplus in the Treasury, the impossibility of applying that surplus to our debt except by buying bonds at an extravagant premium, forces the conviction on all minds that taxation must be reduced.

"What is more reasonable than that this reduction should take place in that direction which will encourage industries and remove from the burden which the people carry those points of friction which gall and irritate more than the weight of the burden itself? The people have made no complaint of the tax on matches, and who will thank the representatives of the people for its removal? But for many years petition after petition has been made for relief from this alcohol *tax on industry.*"

Mr. Robinson also said before the Committee of Ways and Means at the last session of Congress:

"In the United States Dispensatory (p. 1700) I find the following:

"The British Parliament, wishing to encourage the use of alcohol in the arts, but not as a beverage, passed an act, in 1855, allowing it to be used duty free, provided it be mixed with at least one-ninth of its bulk of pyroxylic spirit, which renders it unfit for drinking, but does not spoil it for use in the arts. This mixture is called *methylated spirits*, and is now employed extensively in Great Britain by hatters, brass-founders, and cabinet-makers for dissolving shellac and other resinous substances, and by manufacturing chemists for making ether, chloroform, and sweet spirits of niter. From the purification of pyroxylic spirit already referred to, so as to deprive it of offensive taste, it has been supposed that the intended operation of the British revenue laws might be evaded; but in opposition to this idea it is asserted that the purifying process is too expensive, on the large scale, to render it available for the purpose."

"The process here referred to is very troublesome, and, as previously given in the Dispensatory, involves the use of lime, chloride of calcium, &c., and not by any process of distillation.

"That law has been in operation in England, as Mr. Butterworth stated, for twenty-five or thirty years, and the British people have seen no reason to repeal it. It has been of very great benefit to their arts and manufactures. It is impossible by any process of distillation—contrary to what the Commissioner seems to believe—to separate these spirits. They are both alcohols, and the distillation that passes over one will pass over the other. You can no more separate them by distillation than you can separate a gallon of Chicago alcohol from a gallon of Cincinnati alcohol after they have been once mixed together. Now, this whole methyl question has been disposed of by the Commissioner upon the assumption that they might be separated, but the fact is that they have not been and cannot be practically separated.

"Still further, I do not think any supposition that the American people are less law-abiding, less easily controlled, or less willing to obey laws passed by their own legislature than the English people will pass current here. So that this methyl question cannot be disposed of upon the ground of the probability of fraud. The Commissioner

further says that some 28,000 people may avail themselves of this law. I say more than that; I say that some 40,000,000 of people may avail themselves of this law, because it provides that any firm, individual, or corporation can come forward and ask for this alcohol free of tax. But does this committee suppose for a moment that 40,000,000 of American people are coming forward to ask for an opportunity to defraud the revenue? No! Each man must state in his application, subject to the approval of the Commissioner or the collector, the exact uses to which he desires to put the alcohol, and the Commissioner can impose such stringent regulations that no person can use it for fraudulent purposes without ultimate detection.

"Some six or eight tenths of the whole use under this law would be methylated spirits, and no argument can hold against that use, which has been tried successfully in England for thirty years. The use of pure alcohol would be limited to a few lines of manufacturing establishments, with large investments and large plant, and do you suppose any of the large manufacturers will take the chance of going to the penitentiary by attempting to violate this law? The whole matter is placed right in the grasp of our own officers by the provisions of the law. It is no excuse to give the people for its non-passage that a law proposed for their benefit opens the gate to fraud. All revenue laws open the gate to fraud. The tariff law opens a gate to fraud by agriculturist, because if you can increase the use of alcohol in the arts and manufactures, say, 20,000,000 gallons, that means a market for 5,000,000 bushels of grain, and I will be very glad if a line of legislation could be entered upon that would result in that way. But it seems to me that you should take hold of it in a proper way at the start, and not allow this alcohol to be scattered all over the United States in the hands of a great many people without any supervision. You should confine it to places where there are storekeepers, and in that way the law could be carried into effect without any dilletnly at all."

Mr. Robinson also adds the following figures from the latest British Revenue Returns, to show the satisfaction which this legislation gives after a trial of nearly thirty years:

Quantities methylated (British spirits).

Years.	England.	Scotland.	Ireland.	United Kingdom.
	<i>Gallons.</i>	<i>Gallons.</i>	<i>Gallons.</i>	<i>Gallons.</i>
1880.....	1, 113, 529	472, 868	15, 480	1, 601, 877
1881.....	1, 225, 439	517, 182	20, 038	1, 762, 659
1882.....	1, 296, 776	675, 197	21, 792	1, 991, 765
Increase over 1880 of.....	111, 010	44, 314	4, 558	160, 780
And over 1881 of.....	71, 337	150, 015	1, 754	229, 106

The question, however, whether this system of methylating spirits, or of adopting a system of rebate upon the same for manufacturing purposes, would prove the more judicious is respectfully submitted, with the further urgent recommendation of the abolition of other Internal-Revenue Rates, as set forth in Digest preceding.

PIECE-WORK LABOR.

Referring to the peculiar success of this system of Labor in Europe, the League desires to call attention to the adaptability of this system to our Industries generally as beneficial alike to the capitalist and laborer, as shown in the experience of many of our Manufacturers, and to which the League intends to give attention hereafter. The necessity for brevity in this statement, already too lengthy, prevents such discussion at present.

A TARIFF TRIBUNAL.

Referring to pages 1702 and 1710, in reference to the contradictory rulings of the United States Treasury Department in arbitration of disputed points in the liquidation of customs charges, the League asks particular attention to the present injustice to the business community of the country, in the one-sided and arbitrary decisions to which it is necessary to submit, and herewith refer to the laws of other nations on this important point. The English law reads as follows:

33. In case any merchant or other person who shall feel himself aggrieved by the determination of the commissioners of customs, or have any complaint against any officer of customs as to anything done or omitted by him in or about the execution of his duty, the party so aggrieved or complaining shall be desirous of stating his case personally to one of the commissioners of customs, he may do so on application to the board during the official hours of attendance at the custom-house, or, if he prefer it, may, on application in writing to the commissioner of customs, stating therein his grievance or complaint, have the same inquired into by one of the said commissioners, who shall hear the matter in the presence of the parties, and of any persons interested or desirous of attending; and such commissioner shall take any evidence on oath which may be tendered on such inquiry, reducing the same into writing in a narrative form, and shall lay the same, with his opinion thereon, before the commissioners of customs for their consideration; and such commissioner shall have the same power and authority for enforcing order during such inquiry as is vested in justices of the peace in petty sessions.

Similar to the English and our own law is that of Mexico, as follows:

THE ADJUSTMENT AND PAYMENT OF DUTIES.

ART. 74. I. The adjustment and liquidation of the duties of importation shall be done precisely in the term of twenty-five days, counting from the day on which the vessel that brought the merchandise concluded her discharge. During this time merchants can store their goods in the warehouses of the custom-house, or take them out after they are dispatched, subjecting themselves to the fixed regulations, as in the preceding chapter.

II. The liquidation being terminated, the payment of the duties must be made at once, and in effective money.

ART. 75. Once the goods are dispatched from the custom-house, the duties cannot be returned under any motive, except in case of error in account. For this restitution, or to verify whatever other, must be proceeded with in respective order to the secretary of the treasury, leaving the collectors obliged to remit officially to said secretary the corresponding information, the steps he has taken, and for what cause he presents such information.

ART. 76. If the appraiser in revising the merchandise finds the result less in length, weight, measurement, or number than what is expressed in the permit of dispatch, the duties will be covered on what is expressed in such permits.

In contrast to the above, the League recommends the much wiser, more equitable, and clearer provision of France, which affords the merchant a voice in the decision and a chance for justice:

ART. 4. Article 19 of the law of July 27, 1822, is hereby amended and completed as follows:

The two merchants or manufacturers acting with the expert commissioners in custom-house business shall henceforth be appointed, one by the custom-house and the other by the party declaring, and shall be chosen from a list prepared every year for this purpose by the Chamber of Commerce of Paris. In case one of these parties refuse to designate his arbitrator, such designation shall be made, from the same list, on the demand of the other party, by the justice of peace of the canton wherein the bureau of imports is located. Should both experts agree, their decision shall be final and shall be registered by the legal committee of experts. But should a difference arise, the committee of experts shall act as arbitrator, and render final decision in conformity with the regulations provided in article 19 of the law of July 28, 1822.

This same procedure shall be followed for the expert appraisements on merchandise subject to ad valorem duty. When the values stated by the expert appraisers are in excess of those declared, the penalties provided in article 21, Chapter II, of the law of August 22, 1791, for the prevention of false declarations as to qualities, shall be applied.

ART. 5. The forms for declarations to be presented at the custom-house shall be decided by decrees.

This present law, being duly debated and adopted by the Senate and Chamber of Deputies, shall go into effect as law of the state.

Done at Paris this 7th day of May, 1831.

JULES GREVY,
President of the Republic.

P. TIRARD,
Minister of Agriculture and Commerce.

Such a provision in the Statutes of the United States would unquestionably meet the happy approval of our whole business community; at present the merchant and manufacturer have no consideration whatever, but are compelled to submit to the capricious ruling of one official and one mind. Such ruling is clearly incompetent as well as unjust; and a decided change is necessary.

It has been suggested that the Court of Claims be designated as the tribunal for deciding controvertible cases. Such designation would handicap our merchants even more than the present unjust system. The Court of Claims is not a commercial authority nor even conversant with commercial conditions, and the calendar of that court is sufficiently encumbered already; the delay of a hearing would incapacitate such a court for this duty, without consideration of further objections.

The League therefore respectfully urge that an equitable system for the rendition of decisions upon "Controvertible Questions" be provided for by the creation of a *Tribunal* in which the Industries of our country may have a voice.

W. H. THOMAS.

NEW YORK, *October 7, 1882.*

Mr. W. H. THOMAS, of New York city, addressed the Commission as follows:

As a representative of the importers of Havana cigars, I desire respectfully to represent that in their opinion the present rate of duty on cigars, \$2.50 per pound and 25 per cent. ad valorem, is excessive, and may be judiciously reduced to \$1 per pound and 25 per cent. ad valorem. We believe this reduction will bring a greater revenue to the government, and cannot appreciably affect unfavorably the domestic manufacturers.

From our recollection (being without official information), there were imported into the port of New York from Havana, from 1852 to 1856, about 70,000,000 cigars per annum, under a tariff of 40 per cent. ad valorem.

Under subsequent rates of duty, averaging about 150 per cent., from 1864 to 1868, these imports were from 12,000,000 to 16,000,000 per annum. Under the present rate (\$2.50 per pound and 25 per cent. ad valorem), from 1868 to 1882, these imports have averaged about 37,000,000 per annum, those for 1881 being 35,000,000. This is but a trifle more than half the amount imported in 1852-'56, with an increased population of more than 50 per cent.

The present rate ranges from 60 to 200 per cent., and averages about 87 per cent. on a general business.

Under the rate suggested by us above we think the imports would soon reach 60,000,000 to 70,000,000 per annum, about 2½ per cent. of the quantity manufactured in this country (which we learn is some 2,500,000,000 to 3,000,000,000 per annum), a proportion too trifling to affect unfavorably the manufacturing interest. It is reasonably certain that for some time to come these imports could not exceed 100,000,000 per annum from Havana, for the reason that during the past ten years the total exports of cigars from Cuba to all nations have averaged 168,000,000 per annum, and it is not to be expected that more than one-half should be allotted to this country, leaving only the same supply for the remainder of the world at large.

We remonstrate strongly against a specific rate alone on cigars, for the reason that a cigar weighing 12 pounds per thousand costs in Havana any sum from \$20 to \$125, and of course the duty would be the same on the most inferior as on the best.

By Commissioner McMAHON:

Question. Your suggestion is to put a sliding scale of duty on cigars, is it not?—Answer. No, sir.

Q. We had suggested to us the other day, by Mr. Moore, the advisability of imposing a duty of \$3.50 per pound (I think that was the amount) on all cigars. What would be the effect of such a duty?—A. The effect would be, practically, to prevent the importation of anything but the very best and highest priced cigars.

Q. About where could you draw the line; what would the cigars cost in Cuba which would come in under such a rate of duty?—A. Under

such a provision a poor cigar would pay the same rate of duty as a high-priced cigar; the duty would be the same on cigars costing \$20 a thousand as it would on cigars costing \$150 a thousand.

Q. You say the effect would be that only the highest priced cigars would be imported. Would it exclude the importation of average quality cigars?—A. Yes, sir; I think it would.

Q. Would the result then be to increase correspondingly the price of domestic cigars?—A. I should not think it would.

Q. They would remain about the same in price, you think?—A. Yes, sir.

Q. Although the domestic cigar would have no competitor?—A. I think the competition of the manufacturers here would keep the price down.

Q. What was your recommendation?—A. I would suggest a duty of \$1 a pound and 25 per cent. ad valorem. I think if such a rate of duty were adopted more revenue would be obtained by the government.

Q. Have you in mind any specific rate alone which would not exclude the cheaper grades of cigars? Supposing the ad valorem duty of 25 per cent. was taken off and the duty of \$2.50 allowed to remain, what would be the effect?—A. The effect would be, approximately, the same as in the first case. We are now importing about every grade of cigar that is made, cigars selling from \$75 to \$200 a thousand; the average is about \$100 a thousand.

FRANK PURCELL ET AL.

NEW YORK, *October 7, 1882.*

Mr. FRANK PURCELL, of New York City, representing the Independent Labor party, addressed the Commission as follows:

GENTLEMEN: At a regular meeting of our organization, held on Thursday evening last, it was resolved that the following address be presented to your body, expressive of the wants and wishes of the working classes, upon the question of protection to American labor:

1st. We would call the attention of your honorable body to the facts that over 450,000 men, women, and children are employed in the various manufacturing industries of this city, and dependent for the means of life upon the welfare and protection of those industries; that the yearly market value of this labor and these products is over \$1,000,000,000, nearly double the value of the whole exports of the United States.

2d. That owing to two causes—an influx of cheap goods and cheap labor—the employés are underpaid and overworked. The average hours of labor are 10 per day, and the rate of wages \$3 to \$5 per week for females and \$5 to \$9 per week for males, an amount insufficient to provide decent homes, food, and clothing, and productive of want and ignorance—the source of all evil and the parent of all crime. The men, overworked, seek relief and pleasure in the rum shop; the women, underpaid, are driven to prostitution to keep up a decent appearance, or gratify the tastes created by our system of equality and education; and our children are neglected and underfed, roam the streets, a terror and a disgrace to our community.

Therefore we ask of your body a report advocating an increase of the tariff to the amount required to allow our manufacturers to compete with the manufacturers of Europe and to pay to these employés a fair and just rate of wages, which would be, in our opinion, an increase of 100 per cent. over our present rate.

We also ask your honorable body to recommend measures to prevent the false and fraudulent importation of cheap labor to this country by railroad, land, and mine agents, to the injury of our working classes and the peril of our institutions, and the exportation of our meats, butter, cheese, wheat, corn, &c., to Europe, doubling the cost of the necessaries of life on one hand, and lowering our wages by competition with cheap and degraded labor on the other, making it impossible for us to obtain sufficient wages and employment to pay rent, buy good or sufficient food, dress decently, or properly care for and educate our children.

We ask you to adopt this policy, not as a question of revenue or taxation, but on the ground of principle and duty. As statesmen and lovers of your country and its people, lay down the principle that it is the first duty of governments to protect its own people, and that the basis of all prosperity is productive and diversified industry, and trust to the intelligence and honesty of our people for indorsement for your belief.

We ask you, what care we for a government or its revenues, or what benefit it would be to our class, if by a free-trade policy our industries were destroyed and we were idle tramps upon the streets? No; pay us

for our labor and employ our own people at fair and living wages, and we will cheerfully pay our share of the taxes needed to support our government. If so employed we will consume. The farmers' product now forced to seek a foreign market through our inability to buy food and clothing for our families, and with home markets, home production, exchange, and consumption we will be a happy, free, and prosperous people.

With many thanks for your patience under abuse, insult, and misrepresentation from the enemies of American labor, both employés and employer, and gratitude for your uniform justice and fairness to all classes (even the undeserving),

We remain yours to command,

ROBERT A. FERRIER,
FRANK PURCELL,
WALTER H. BAMETT,
JOHN J. KEHOE,
GEO. D. LEMON,

FRANK WATERS,
GEORGE BANZER,
ED. T. PATTERSON,
JAMES A. EARLEY,
WM. A. A. CARSEY,

*Committee on Tariff Legislation,
Independent Labor Party.*

By Commissioner GARLAND:

Question. What is the strength of the organization you represent?—
Answer. The exact number I could not positively state. We have, however, an organization in every assembly district in New York.

Q. Is your organization confined to mechanics of any special line?—
A. No, sir; not any special line. Our membership includes mechanics, laborers, and business men of all kinds, and everybody interested in labor movements.

Q. Have the members discussed this matter in their organization?—
A. Yes, sir; they have.

Q. And you represent the predominant sentiments of the membership?—
A. Yes, sir; that is the sentiment of the Independent Labor party of New York.

Mr. W. A. A. CARSEY said:

One of the Commission asked Mr. Purcell a question about our organization. I will state that we have an enrolled membership of some 1,500 persons; in some districts 250 to 300 names, and in some 100 names; I mean the members who attend the meetings and belong to the organization. We have a roll which every member must sign, which provides that he will abide by the action of the majority, and support and vote for the nominees of the party. Every man who joins the organization does so intelligently, knowing what our principles are.

In pursuance of the instructions we have received I come here this evening to bring to your notice the other branch of our platform—the revival of the shipping interests.

Our cardinal doctrines are two: the protection of American labor and the revival of American shipping. Permit me, on behalf of the Labor party, to say a few words upon the question of shipping.

We all admit and lament the fact that our carrying trade is in the hands of foreign shippers, and we pay one hundred millions per year to foreigners to do our ocean carrying.

We also, for want of a direct line of steamers, lose one hundred millions of trade with South America, that could be obtained by a line of steamships to the ports of that country.

We also admit our defenseless condition in case of war with the most puny of European nations.

We suggest a simple remedy: extend our postal system to the ocean, and contract the carrying of our mails to the lowest bidder who will furnish American-built ships with American crews and owners.

Repeal or reduce to a minimum all taxes, dues, and charges upon American ships owned and manned by American citizens.

This is an immediate and practical remedy; in the future we hope to see the two steel cruisers, now ordered built, employed in the carrying of the mails and merchandise to Liverpool or Brazil, and twenty more built to be employed in the same useful labor, and in time a fleet of vessels of this character take the place of our present useless Navy.

If we must have a Navy, make it useful and self-supporting. If we must have foreign trade, let it be carried on in our own ships, and the profits and employment benefit our own people.

You may be aware that all the carrying trade of this city is at present in the hands of the German, French, and English companies. It is also a fact that they do not buy a pound of nails or a quart of oil or any other article in the city of New York. They bring everything they use from the other side, it being cheaper for them to buy there. They sometimes go back to Europe in almost a disabled condition rather than buy from our people. And yet we pay these people \$100,000,000 a year to carry our goods to the other side, and all that is a profit given to them. That is not right, and I hope the attention of Congress will be drawn to the fact. The remedy we offer for this is the extension of our mail service to the ocean carrying trade. That is a simple remedy, and a just one, I think. There are post-office contracts to be given for carrying the mails, and we can afford to build vessels to carry them, and in ten years from now we shall place the shipping of this country where it should be. I think a subsidy should be paid for such service to the parties who will enter into it. This remedy is a novel one, and one that may be laughed at for a year or two; but I will ask you, should not our sailors and officers be useful for the benefit of the country in the carrying of ocean mails and merchandise in the place of idling their time away in the ports of Europe and America? The condition of our sailors is not a fit or proper one for American sailors to be in. Our naval system is a slavish, degrading system, and we hope to see the day when our naval officers and sailors will be usefully employed. We could save the \$20,000,000 or \$25,000,000 now paid for the support of the Navy. I think that the vessels of the United States could be so constructed and used as to bring to the United States a revenue which would more than pay their way, instead of being a burden and expense on the revenues of the country.

By Commissioner BOTELEK:

Question. Does this organization of yours extend to other States?—
Answer. We have a State organization here, and we have labor organizations all over the United States, but we have no *bona fide* national organization. We had some, but most of them drifted into the Green-back party.

By the PRESIDENT:

Q. Does your organization recognize the element of strikes?—A. By bitter experience we have found the folly of entering into strikes. We know that strikes never succeed, or, if they do, it is only a temporary success and results in greater injury to us afterwards. We have never gained anything by them. Only 3 per cent. of strikes succeed; 97 per cent. are failures. Even when we succeed in a strike the result is

that the market is flooded with labor brought from other States and cities, and then, in a year or two, that brings the wages down lower than before. I was connected with a bricklayers' strike in New York. We were working 8 hours and getting paid \$5 a day. There was plenty of work, and everybody was employed and making money. We were not satisfied and went on a strike for another dollar. The result was that we spent \$18,000 in maintaining that strike, and were six months idle. We gained the strike and got an increase of wages, but in six months or a year afterwards bricklayers from all over the country, and from Europe, flocked in here, and the bosses discharged those who had taken part in the strike, one by one, and employed men who had just come from other places; they got rid of all the strikers, and to-day the bricklayers are very glad to work ten hours and get \$4 for it. At one time wages went down to \$2.50 and \$3 a day. The bricklayers' organization, after spending \$18,000, went to pieces.

Q. Then your movement is a reaction against the old labor organizations, or the socialistic movement?—A. Our movement is against the trades union system of strikes. The trades unions in this city and country gather men together from separate trades—shoemakers with shoemakers, tailors with tailors, and so on; every organization fights not only the employers but every other trade. Each wants an organization for itself. Their constitution forbids political action, and if a grievance comes up there is a strike, and it will end in the ruin of American industry.

The American laborer is degenerating; there is no sympathy between the employer and the employé. They work against each other, and it benefits neither the one nor the other. We propose to go back to the old system and bring harmony between the employer and the workmen by creating a mutuality of interest; by settling these questions at the ballot-box in contradistinction to those who want to make classes which antagonize other classes. We want to teach working people that the government is their best friend, and that the interest of the employer and the workman is identical.

Mr. P. O'REILLY said:

My business is that of a contractor and builder. I have but few words to say on this subject. In my experience, covering a period of twenty-five years, I have noticed a great change in the city of New York in regard to the condition of the workingman. When I was a boy in a workshop we had to depend solely on foreign goods. If we wanted a first-class saw, chisel, or a hammer, it was always of English make. That was in the days of what they termed a "low tariff." But things have changed materially since then, and now there are no tools in the market worth having that are not of American make. The tariff has increased manufactures and given manufacturers encouragement, so that now we produce the best tools in the world. That shows the necessity of continuing this great system that has developed such wonderful resources, and has increased our business and our prosperity. Owing to the protective tariff New York has become a wealthy city, and wealthy men, instead of living in houses costing a few thousand dollars, have built elegant mansions costing many hundred thousand dollars, and all this has given employment to the workman, and we have been benefited by it. I claim that the tariff has created an immense amount of wealth in this country, and that it has enabled us to keep the money we have made in this country instead of having to send it abroad to buy articles of general consumption. If we did not have this

tariff system our money would have to be sent abroad to purchase these articles, and the result would be that we should remain "hewers of wood and drawers of water."

I do not think any one will deny the fact that the American mechanic is the best paid, the best fed, the best clothed, and the best educated workman in the world. I defy the world to show his equal. We have, through our system of high tariff, been able to pay good wages to the laborer, which means better clothing, better education for his children, good living, and everything that makes society happy and comfortable. So that, I think, if there is anything in the world that the American workman or mechanic should advocate, it is a high tariff, or a protective tariff at least. Of course there are some abuses connected with the tariff; I admit that fact. It is wrong that some corporations should be able to declare dividends of 60 per cent. on their capital for one year's earnings. I am informed that the Bessemer Steel Company of Pennsylvania declared such a dividend. Of course such a thing is not right; but you, gentlemen, are possessed of the wisdom and information which will doubtless enable you to recommend such an adjustment of the existing tariff laws that such immense profit, may not be realized. In this country people invest their capital and expect to make a fortune and get rich in the course of a few years, while abroad the business descends from father to son, and the people there do not expect to make the profits that our American manufacturers make. The result is, that they can undersell us on account of their cheap labor system in every way.

To sum up the whole matter, the prosperity of this country depends solely upon educating our people in the arts and sciences, and in mechanics. In that way we shall become a great nation, and be able not only to supply ourselves with all the necessaries of life, but also be able to supply a large portion of the rest of the world.

By Commissioner BOTELER [to Mr. Carsey]:

Q. Has your organization ever taken into consideration the subject of arbitration between employers and employés?—A. The intelligent workingmen all over the world seem to agree in regard to two remedies for their labor troubles—the one is arbitration and the other co-operation. How to bring these results about is the question. In the city of New York Mr. Thurber, one of our merchants, and Mr. Brewster, the carriage manufacturer, have adopted a system by which, after paying their men their wages for the year, they allow them a certain percentage of the profits made in the business. This plan seems to work very satisfactorily, and consequently there are no strikes as far as the employés of these two houses are concerned. The labor organization called the Knights of Labor have a membership of two or three hundred thousand, including every trade and calling, and one of the great objects of the organization is to teach the workingman the use of the ballot as a means of redressing his wrongs.

By the PRESIDENT:

Q. Do you know of any case of a successful system of co-operation instituted by workmen alone in this city?—A. No, sir. There has never been any successful system of co-operation on a large scale. We expected to have Mr. Kehoe here with us this evening. He would have represented the co-operative shoemakers, which organization has been successful on a small scale. As a rule, though, these enterprises have not been successful. Workingmen do not seem to be able to carry out

these great enterprises successfully. There have been nearly one hundred co-operative movements in this city. But the workmen fight among themselves and are jealous of each other, and the organization does not last long. Such organizations have often been successful pecuniarily, but they have never held together for any length of time.

Mr. ROBERT O. FERRIER said:

The statement which has been presented to the Commission this evening embodies my views pretty fully, but there are one or two other points which I should like to call attention to. There has been considerable protection given to the manufacturers of goods and so on, but there has never been any protection in this country for labor directly. We have had protection upon certain kinds of goods, but at the same time we have allowed labor to come into the country free, without putting any tax upon it. The result has been, as I look at it, that we have filled this country with a great deal of free labor. A great many of these people come here and do not take the responsibility of citizenship upon their shoulders. The result is that so much foreign labor has crowded out men who have the responsibilities of citizenship placed upon them. As a consequence, many Americans have been compelled to go traveling through the country without being able to get employment at all. To illustrate this point I will confine myself to the condition of things in the city of New York. I would like to ask how many citizens of the United States are employed by the city government to do the work of the city? I dare say that at least two-fifths of the men employed in the city of New York by the city authorities are not citizens of the United States. Yet we all know, at the same time, this city is full of people who have the responsibility of citizenship upon their shoulders who cannot get employment. This condition of affairs has been brought about by allowing free emigration of the laborer to this country; and my idea would be to put a tax upon every emigrant who comes to these shores the same as a tax is put on goods which are brought into the country.

Mr. JOHN T. WINN said:

As a member of the committee, I indorse what Mr. Ferrier has stated. I do not desire to make any further statement.

J. SCHOENHOF.

NEW YORK, *October 7, 1882.*

Mr. J. SCHOENHOF, of New York, addressed the Commission as follows:

I desire to give my views, as a manufacturer, on the effect of the tariff upon woolen goods.

The effect of our system of taxation upon our manufacturing industries is of so dangerous a character that manufacturers have to combine against a continuation of taxes on raw materials, if they wish to continue in a prosperous state and save themselves from a recurrence of the gloomy experience they have gone through with during the dark years 1873-'79. The same influences that brought about the catastrophe of 1873 and made its consequences continue in ever-increasing proportions till 1879 are still at work. The high prices obtained by protected industries attract large competition in the same fields, and this high rate of competition in the special industries, brought about by high-priced materials, finally worked down profits and prices to such a low condition that most of our manufacturers were ruined and the workmen deprived of employment, brought to the brink of starvation, and useful citizens turned into tramps. It is quite evident to any mind that is not misled by sophistical doctrines that in order to produce cheaply you must have cheap materials; that in order to work profitably you must be able to have an open market for your products. High-priced materials, however, will inevitably limit your market to the few outlets which you possess in this country. As soon as your own marts are supplied then your outlet is filled up; whereas with cheap raw material you would be able to compete in foreign markets with any other commercial nation. With high material you either have to stop production until reviving demand sets your works in motion, or continue with a sure outlook into bankruptcy.

It can be proven by comparing statistics that all we need to compete successfully in the race for commercial supremacy throughout the world is to obtain our raw material at as favorable terms as Great Britain, France, and Germany obtain them now under other tariff systems. The perfection of our machinery, the intelligence of our working people, the better mode of subsistence of our operatives, all combine to make our fabrics comparatively cheaper under a higher rate of wages than they are in Europe under a comparatively low rate of wages. In all manufactures where raw materials are not protected, such as cotton goods, we are able to export and compete successfully with Germany and Great Britain in their own ports and markets. In machinery, tools, firearms, our ingenuity, our inventive faculties, are sufficiently powerful to overcome the higher price of raw materials and labor to enable us to export them to foreign countries, to England, Germany, and the commercial dependencies of these countries. The argument of difference of wages is wrongfully called into play to work upon people's minds. It induces our law-makers to perpetuate our present system of taxation, whilst it can be shown that the same rate of wages can be maintained, more perpetual employment guaranteed, and a greater purchasing power given to the earnings of our working people if taxes be stricken from all raw materials and their free importation guaranteed.

Woolen goods protected by 100 per cent. hardly enable their manufacturers to make sufficient profit to save them from bankruptcy. I know from my own experience that goods manufactured in Berlin undersell American-made goods that are protected by 100 per cent. and more duty. These goods are made of cloth which costs in Berlin 75 to 85 cents, while the American article is sold for \$1.75. The cloth is made of wool which costs here 30 cents a pound raw, while the Berlin manufacturers can use Australian wool which costs one-half that price in the grease. This sufficiently explains why we cannot compete against Berlin-made goods. If, instead of raising the tariff on manufactured goods, we were to abolish the tariff on wool, we should be amply protected by a tariff of 20 to 25 per cent. As the matter stands now we do not find any protection at all in a tariff of 100 per cent. The consequence of this pernicious system is doubly destructive of our industries.

Our manufacturers in the woolen line are compelled, by the exclusion of a sufficiently cheap supply of foreign wools, to run nearly all one line of goods, from cheap to middling. Had we cheap foreign wools we could manufacture a variety of cloths and woolen goods, and all would find useful occupation. All being compelled to use the same class or to make the same class of goods, competition becomes well-nigh destructive of that special industry. We are importing now all finer woolen goods, to the extent of many tens of millions of dollars, which we could not manufacture here, even if we endeavored, because the fine imported goods can be sold at less price on account of the cheap wool at the command of foreign manufacturers. For certain purposes in the manufacture of woolen goods our wools are not adapted. You cannot, by an act of Congress, change the fiber of wool, its softness or harshness; certain natural inherent qualities cannot be subjugated by legislative enactment. The adulteration of fabrics, the introduction of shoddy and cotton into woolen goods in order to cheapen the article, supplies our working people with clothing of bad wearing qualities that gives little warmth, at much higher price than the English workingman pays for much more durable clothing.

In the production of these goods a great deal of cheap labor is employed. Most of the work is done by machinery, highly efficient, and run frequently by children of from twelve to seventeen years of age, who earn from \$2 to \$3 a week with incessant labor of ten to eleven hours a day, and in spite of all these indisputable facts the workingman is made to believe that this high tariff is necessary to insure him the scanty wages which he gets in most of these high-protected industries.

The iron and steel interest makes it a special pleading to the farmer that protection of raw wool is essential to the farmers' prosperity. That same iron and steel interest is constantly threatening the wool interest in Congress to turn against a continuation of the tariff on wool if the tariff on iron and steel were changed by the vote of the wool-growing districts. An examination into the real benefits derived by the farmer from this protective system must convince him that he is the loser by it. We raised in the census year 35,000,000 sheep, distributed among four millions of farmers. This gives to each farmer about nine sheep. Many States raise very few sheep; all States whose land becomes valuable in proportion to the increase of population decrease their number of sheep. Large sheep culture is mostly practiced where the lands are abundant and cost absolutely nothing to the sheep-raiser.

I have here special tables from the Census Reports of 1860, 1870, and 1880 to show you how sheep culture has left the denser settlements and gone West. It is most apparent in comparing the census of 1870 with

that of 1880. Furthermore, I wish to say that the increase in the raising of sheep has been about equal in proportion to the increase in population. Here are the sheep statistics as shown by the census: In 1860, 22,000,000; in 1870, 28,000,000; and in 1880, 35,000,000; from which it can be proven that the increase of sheep raising is not due to the protection of wool, because in 1860 we had a free tariff on wool and still the sheep culture was not specially increased by it.

For sheep farming the climate is by no means more inclement than the climate of Great Britain and Germany, yet Great Britain raises 35,000,000 sheep and Germany 24,000,000, and still no protection is claimed in those countries for their wool. They are willing to let in the sheep wool of Australia, of the Cape, and of South America, and use it with their much higher priced staples with great advantage to their manufacturing industries. Considering that this large sheep-raising interest is mostly concentrated in America in comparatively few localities, this wholesale taxing of wool is another instance of taxing the many to enrich the few. The few wool growers use the millions of farmers who produce little wool as cat's-paws to get their chestnuts out of the fire. The burdens which every farmer has to carry, as a consumer of woolen goods, are at least three times as high as the amount he would get more for his wool if all sheep raised in the United States were equally divided between each and every farmer. Nine sheep per farmer raise about 65 pounds of raw wool, which, at a protection of 12 cents, gives him \$7.80 protection if he were to share the full benefit of protection. His clothing and woolen wear for himself and family cost him fully, on the average, \$50, which \$50 are fully twice as high as they would be under free wool; consequently in woolen goods alone he has to pay a tax of \$25 from his earnings, while his imaginary earnings from sheep raising only average \$7.80. I don't add to this calculation the high price of his tools, of his machinery, his agricultural implements and household utensils, which are equally enhanced in price by this obnoxious system of tariff legislation.

After all, a clear demonstration of facts and figures simplifies the whole tariff question very materially; it takes away all the vagueness and haziness which our high-tariff men are in the habit of surrounding it with. In every instance it can be demonstrated that the producer, the farmer, the workingman has to pay from every dollar of his earnings at least 10 cents as the result of inflation caused by taxing raw materials. Manufacturers of finished goods are not protected! They are worse than not protected. Our tariff, called a tariff for protection, is simply a tariff for the protection of raw materials, raw wool, coal, iron, and steel in its cruder forms, and a sacrifice of all other industries to producers of these articles.

Why should we not be able, with our cheap lands, to invite free wool as well as England under her tenant system? Why not have free coal, free ores, and other raw materials? Why not start production on the level plain, instead of starting on a raised platform of high-priced materials? Equal protection means protection to no one. You cannot protect the raw-material man and the maker of finished goods at the same time. High-priced raw materials means ruin to the manufacturer. The producers of the first are few in number compared to the latter. Millions of workingmen depend on manufacture. Stagnation in trade means untold misery, cold, and starvation to all these multitudes, whose average incomes during the census year of 1870—a year of high prices—did not exceed the sum of \$338 of inflated money. It is better that these millions of men should find remunerative and steady employment than that a

whole nation be kept dependent and hemmed in by the greed of a few wealthy monopolists and great operators, whose millions of dollars stand in ghastly relief against the wretchedness of their miners and laborers. What we gain by the tariff on manufactured goods is usually balanced by the higher tariff on raw materials. We would not be relieved by any addition to the tariff on manufactured goods if the tariff on raw materials remain as it stands.

The effect of our tariff, the proof of the correctness of this statement can be seen in the constantly increasing importation of foreign manufactured goods. The great exports of the United States consist principally of the products of the soil. The bad agricultural system of Great Britain, its feudal laws of primogeniture and entail, cause England to look for one-half its food supply from abroad. Should this great demand by England for our food produce here change or cease from any cause whatsoever, our exportation would diminish to an extent that stagnation and financial ruin would follow. The rapid extension of our farming interests, the parallel extension of our manufacturing interests will become a source of danger and collapse unless we diversify our exports, unless we enable our manufacturers to find their customers amongst the five hundred millions of European nations and their colonies, instead of walling them down into a narrow circle of fifty millions.

By Commissioner BOTELER:

Question. As a great many thousand of our people are engaged in mining iron ore, and cutting timber, and other work of that kind connected with raw material which manufacturers use, what would be the effect upon that class of our people if free trade in raw material should obtain?—Answer. I believe they would be employed just as well.

Q. In what?—A. In the same kind of industry. For instance, it has been proven, and experience teaches us, that wherever we have taken off duties on any kind of raw material or article of consumption the price has in consequence reduced very materially.

Q. Do you think the coal miners would be able to get the same rate of wages?—A. I believe they would. The rate of wages for laborers in our coal mines, although not quite as low as in England, is not very materially different. In fact, a close study of this question has convinced me that in all work in England, especially that connected with large industrial pursuits which employ plant, large machinery, &c., and where the combination of labor is facilitated by working together, prices range within 20 per cent., and in some of the industries even less than that, of ours.

Q. What is the difference between the wages paid to the English and to the American colliers?—A. That depends entirely upon the means of production they have. I have not in my mind the exact wages paid to colliers, but, taking the reports from English statisticians, I do not think there is 25 per cent. difference in wages over our own miners, who do not get much over \$300 a year.

Q. Are you personally acquainted with the style of living of the European laborer?—A. Yes, sir; that is to say, nothing more than my recollection of European life some years ago. When I speak of European laborers as compared with American laborers I speak of English laborers because they are the highest paid, and the only formidable competitors we have to encounter.

Q. Do you think there is any comparison between the condition of the English laboring man and the condition of the American laboring

man in the matter of living; in his food, clothing, and ability to educate his children and bring them up respectably?—A. Yes, sir; I do.

Q. Where does the advantage lie, with the Americans or with the English?—A. The advantage is not to be found anywhere, to any large extent, because we have, during the last ten years or so, made very rapid progress in the improvement of our laboring population. In many industries, however, I do not believe they get any more than the English laborers get; and we have supplanted American laborers to a large extent by laborers from Europe, and that has had a tendency to cheapen labor, so that a process of equalization has been going on to a great extent.

Q. If the condition of the English laborer is equal, or nearly equal, to that of the American laborer, why is it that Englishmen come here to this country to better their condition, and that the tide of emigration has no reflux, but has been tending in this direction ever since the formation, of our government? They come here to better their condition, it is to be supposed, do they not?—A. In reply to that I have to say that if you offer a poor man who never owned an acre of land, and is debarred from ever owning any by the obnoxious laws in England and Ireland—if you invite him here and give him 160 acres of the best land he can find, I suppose that is inducement enough for him to come.

Q. But the homestead bill has only been in operation a short time, and many of the emigrants do not go into the country at all when they get here. How do you account for their coming under those circumstances?—A. The English people are not coming to this country in such large numbers as they used to, because their condition has been materially improved. The laborers who do come over are mostly Irish and Germans, or natives of countries where their condition is very poor. I believe that if we continue the system of squandering our public domain for the next twenty-five years as we have done in the last twenty-five years, the influx of foreign laborers will be very materially lessened.

Q. You do not think they get any better wages here than they do abroad?—A. If you take the purchasing power of wages into consideration, I maintain that the English laborer gets perhaps within 10 per cent. of the wages of the American laborer.

Q. But he is not surrounded by the same comforts in living as he is here.—A. That I cannot say. But I know, according to the consumption of all goods that go into the hands of the laboring classes, the English consume much more than any other class of the European nations, and nearly as much as the Americans.

By Commissioner GARLAND:

Q. Do you advocate the free introduction of wool?—A. Yes, sir.

Q. What effect, in your opinion, would that have upon the wool production in this country?—A. I think it would at first depress prices somewhat, but not be any great injury to the wool interest in the long run. I do not believe it would alter the condition of the sheep farmer one bit.

Q. What effect does the present tariff have upon the price of wool in this country, in your opinion?—A. It causes it to fluctuate constantly. One year the price is so low that it is not profitable to raise wool, and they kill the sheep, and then an artificially high price is created by the scarcity.

Q. You think that is caused by the tariff laws?—A. Most inevitably, because it excludes the leveling influence of foreign supplies.

Q. Are fluctuations in the prices of wool peculiar to this country?—A. Yes, sir; more so than anywhere else. Of course the tendency in

the price of wool for the last twenty or twenty-five years has been a downward one, on account of the increase in sheep culture in large territories which have been given up to that industry.

Q. I understood you to say that the increase of sheep had not been rapid, that it was limited.—A. It is now, I believe, 35,000,000, and I remember some years ago it was 40,000,000.

Q. Where do you get your figures?—A. From the latest census reports on stock raising.

Q. Is that the number of sheep in the States?—A. Yes, sir; and in the Territories.

Q. In looking through those statistics did you pay attention to the amount of wool raised in proportion to the number of sheep? Please give that.—A. In 1870 the number of sheep was put down as 28,000,000, and the wool raised is given as 100,000,000 pounds, which would give something over 3 pounds to a sheep. In 1880 there were 35,000,000 sheep, and the wool raised was over 200,000,000 pounds, which is 7 pounds to the sheep.

Q. Would not that give a more substantial improvement than the figures you mentioned?—A. Certainly.

Q. In other words, we are getting two pounds of wool where we got one pound ten years ago?—A. Yes, sir; and that would be another argument in favor of taking the tariff off wool.

Q. I understood you to say that if the tariff was taken off wool it would depress that industry.—A. But it does not follow that the wool that grows on the sheep's back would be decreased.

Q. What do you mean, then, by depressing the industry?—A. Perhaps the farmers who have been in the habit of getting 25 or 30 cents a pound would in the start think it a hardship if they could only get 20 cents a pound, but they would get used to that, just the same as the poor manufacturers have to get used to all the depressing influences of prices.

Q. You are a wool manufacturer, are you?—A. Yes, sir, I am; and I know how hard it has been to manufacture woolen goods with prices so high that you cannot do anything with your surplus.

By Commissioner BOTELER :

Q. But you say you have 100 per cent. protection on the wool manufactured?—A. Yes, sir; and on some articles more, and that is a point that I wish to speak about.

Q. If you, as a manufacturer, have 100 per cent. protection and that is not sufficient, in your opinion, don't you think it is rather ungracious to ask that those who raise wool and make their living in that way should have no protection at all?—A. No, sir; I think it is only just. I do not claim for my part any protection. I believe I could get along, if I had everything as cheap as anybody else, with hardly any tariff on. The real trouble lies in the high price on which we started. I used to export goods to Europe six or eight years ago. I manufacture an article in which felts are largely used. We have such excellent machinery for manufacturing them that we undersold the English in England, the Germans in Germany, and the Canadians in Canada, but we cannot do so any more because they have copied our modes of production and our machinery, and by the introduction of their cheap wools they are beating us out of the field. I could cite more instances where we do not need protection on account of labor and machinery, but only on account of materials.

By Commissioner PORTER :

Q. Have you any comparative statement of the wages paid in this

country and in England?—A. I have only a statement of wages paid in the United States according to the census report for 1880; I refer to the report of Professor Pumpelly.

Q. You have the English wages also?—A. Yes, sir.

Q. I believe you stated that emigration from England to this country had decreased. Do you know as a matter of fact whether it has absolutely increased or decreased during the last few years?—A. Yes, sir; it has decreased from England particularly; not from Ireland.

Q. Are you prepared to say that it has absolutely decreased during the last two years?—A. No, sir; not during the last two years, but it is not as great as it was formerly.

By Commissioner McMAHON:

Q. I understand you to recommend that raw wool be admitted free of duty?—A. Yes, sir.

Q. Do you make that recommendation as a specific recommendation on behalf of the manufacturers of wool?—A. I cannot answer that question yes or no; I shall have to explain myself. I believe that owing to our improved machinery in this country the woolen manufacturers with raw materials admitted free would not need any protection for a few years. It would be absurd, under the spirit of the American manufacturers in regard to protection, to recommend anything like absolute free trade. But I think with a duty of 25 or 35 per cent. at the outside, it would be better than to have the present duty continued of 50 cents a pound and 35 per cent. ad valorem.

[The witness produced samples of cloakings of English and American make, which he said were of similar quality, and gave the price of the American goods as being \$2.10 a yard net, and the price of the English goods 95 cents a yard net.]

Q. Do you assume that the difference in the cost of these goods, which is very great, is attributable mainly to the protective duty on wool, or to other conditions?—A. I attribute it to the protective duty on wool and to the protective duty on woolems.

Q. Can you recommend any rate of duty which, in your judgment, would be more equitable than the present one?—A. I find that the greatest injustice lies in a specific duty. The cheap goods pay the highest duty, and the finest goods the lowest. Take, for instance, the article of cloakings. I have here some heavy ones that weigh a pound and a half to the yard and cost about 75 cents. The duty is 100 per cent., weight duty, and 35 per cent. ad valorem, making a duty of 135 per cent. on a piece of cloakings made half of cotton and shoddy and the outside of wool. Take a fine piece of cloth, such as coatings, that cost \$3 a yard on the other side, and the ad valorem duty is very light, compared with their value.

Q. I understand, then, that you object to a specific duty as being an unfair one?—A. Yes, sir, I do.

Q. Do you recommend a purely ad valorem duty?—A. Yes, sir.

Q. Do you regard an ad valorem duty as being a secure method of collecting the duty?—A. No, sir; not wholly.

Q. Then what do you suggest?—A. We cannot prevent cheating and undervaluation. But I think an ad valorem duty, upon the whole, is the fairest method of collecting the duty.

By the PRESIDENT:

Q. What class of goods do you manufacture?—A. I manufacture felt skirts and cloaks sometimes.

Q. Do you make the felt yourself?—A. No, sir; I buy the felt.

Q. Then you are not a woolen manufacturer?—A. I have a certain interest in it.

Q. You stated that you were a woolen manufacturer, and it seems you are a maker of skirts. Then you are just as much of a woolen manufacturer as a tailor is a woolen manufacturer?—A. Yes, sir; I have to get my material from the mills which make it.

Q. Then you are not familiar with the woolen manufacture?—A. Certainly I am, because I have been interested in it and in the manufacture of felt too.

Q. Please tell me, then, the price of Mestizo wool at Buenos Ayres to-day.—A. I am not buying any wool at present.

Q. But you say you are familiar with wool, and you ought to know the price of it.—A. As I am not buying now I cannot tell you.

Q. Have you ever known the price of Mestizo wool? When did you last know the price of Mestizo wool, or can you tell me the price of Mestizo wool at any time within your recollection, at Buenos Ayres?—A. I do not remember the figures now, because I never have bought foreign wools.

Q. How, in your judgment, does the price of Mestizo wools compare with the price of American wools to-day?—A. They are considerably lower.

Q. How much lower?—A. Perhaps 50 per cent. lower.

Q. Are they not 75 per cent. lower?—A. No, sir; I think about 50 per cent.

Q. They are the cheapest wools grown, are they not?—A. Australian wools are the cheapest.

Q. Do you think the Australian wools are as cheap as the Mestizo wools?—A. Yes, sir.

Q. Do you think the free introduction of wool from Buenos Ayres would not have an injurious effect upon the wool-growers of this country?—A. Well, of course, at the first start it would depress the business.

Q. Would it not have the effect of causing him to abandon the business of wool-growing?—A. I do not see why it should.

Q. You have had no experience, then, as a woolen manufacturer?—A. No, sir; I only know what the goods cost to make. But in going to the mill-owners for the prices I certainly have a good way of judging why they have to pay such prices.

By Commissioner GARLAND:

Q. You stated to me that you were a woolen manufacturer.—A. I am not a manufacturer of woolen goods.

Q. You do not manufacture wool into woolen goods? You do not think it necessary to qualify your answer?—A. No, sir; I do not think it necessary. I can form an opinion in regard to those matters because I have to buy my goods and pay a high price for them on account of protective duties.

By Commissioner MCMAHON:

Q. Do you or not think that you have just as good an opportunity of knowing the value of woolen goods which you deal in, from the fact that you make skirts, as if you were in the manufacture of goods from raw materials?—A. I think so.

HENRY A. CRAM.

NEW YORK, Oct. 7, 1882.

Mr. HENRY A. CRAM, of New York City, addressed the Commission as follows :

I want to say a word in regard to the propriety of putting books upon the free list. I have no personal interest in the matter excepting that I read ; as to the price of books, my interest is very trifling. I want to call the attention of the Commission to the fact that there is no country in the world which puts a tax upon learning as our country does. Many people think, and I believe justly, that it is unwise and not to the credit of the country to do so ; that it is putting impediments and obstacles in the way of culture and in the way of education. The present duty is 25 per cent., and in considering the subject, it is worth while to look at it as it applies to English books and to foreign books. With respect to foreign books it is almost a prohibition. If you want an Italian book you cannot get it. There is no place in New York, in this large city, where you can buy an Italian book, so far as I know. You can go into a side street or by-way, and perhaps find a poor, stale collection of Italian novels. I believe Mr. Christern was induced by somebody to import a few Italian books. You can buy the Italian classics, of course. But every new production of Italian literature is precluded by the duty. Then, too, as regards the new publications of Germany. With few exceptions none of them reach here except on private orders. The same is true in regard to French literature. We have a great abundance of the light literature of France. That comes in, and that taste is gratified. There is a great abundance of material. But in regard to all the better productions of French literature, very little comes in, and certainly this duty of 25 per centum has something to do with it.

Now, who buys these books ? I do not think the assertion will be disputed that the men who read in this country are not, as a rule, rich ; they are poor. The tax is paid by the poor ; by the poor citizen and the college professor ; by the experts of the country ; the men connected with industrial pursuits who want to bring themselves up with the science pertaining to their business. The books they want are mostly in foreign literature. Take Germany and France. Those two countries produce scientific books in enormous quantities, and they are necessary for the use of scientific men in this country. Students and professors are usually poor. They pay this tax. For whose benefit do they pay it ? In the case of foreign books it would be very difficult to say. They do not pay it for anybody's benefit, because there are scarcely any foreign books printed in this country. There are some German books printed in New York, because New York is in some respects a foreign city. But nobody is protected by this duty on foreign books. So that there is no necessity in keeping the duty upon them. In regard to English books there is one class benefited by the duty—the booksellers, and they object to its repeal. The importers of foreign books, I understand, do not.

By Commissioner BOTTLER :

Question. You mean the publishers ?—Answer. No, sir ; I mean the importers. There are very few importers of foreign books. I mean the importers and dealers in books published in foreign languages. This is a subject in which hardly any one has a personal interest on the one

side, while there is a great personal interest on the other side, on the part of the booksellers.

Now, take the case of an English book, and see how this law operates. A book is published in London, say, for five dollars, called the publishing price. Any one who has been in London knows that you can buy that book at retail from almost any bookseller in London for about 20 to 25 per cent. less than the publishing price. So that a book published in London at five dollars, I, or you, may buy for four dollars. What the publisher buys it for I do not know, but he buys it at a less price than the dealer or than I could. I could go to Leicester Square, to a large book-shop there, and buy a five-dollar book for four dollars. The duty on it is certainly less than a dollar, because the importer pays less than four dollars. But if I go to a store in New York to get it, what I buy for four dollars in London I am supposed to pay eight dollars for here, and generally ten dollars. You will find in the store of the thriving importer of English books that that is not an exceptional price; and when I grumble, or when my poor bother, the college professor, or the student grumbles about it, "Oh," they say, "it is the duty," although the duty has nothing to do with it.

So that I say it is a thing not creditable to the country, and not known to the same extent in any other country. I have not investigated the subject, but I do not think I would be making an erroneous assertion, if I said that in no country in the world is such a tax laid upon learning as in our country, a country that owes so much to, and hopes for so much from, the education of the people. We stand as this single and odious exception of putting a tax upon learning; a tax levied upon the poor man for the benefit of the rich class. There is no tax upon books in England. I do not think even Bismarck, who is now a great protectionist, would propose such a thing. I am quite certain that he has not proposed it. Such a tax does not exist in Germany, in England, or even in autocratic Russia, and if it exists in France it is a mere nominal sum, where you have to pay a little fee, and not such a tax as it is here.

These are the only suggestions I desire to make to this honorable body. I hope you may be able to concur in some of my views, and that the considerations I have presented will induce you to recommend the repeal of this duty.

By Commissioner BOTELER :

Q. You are aware, I suppose, that books published twenty years ago and more are admitted free?—A. Yes, sir.

Q. And that all the great works of English literature published previous to that time are admitted free?—A. Yes, sir.

Q. It is only upon modern publications that the tax is imposed?—A. Yes, sir.

Q. You are aware, also, that books intended for scientific purposes—for our academies and scientific institutions—are admitted free of duty?—A. Yes, sir.

Q. And books belonging to persons who come to this country, the libraries of professional men who come from abroad, are admitted free?—A. Not quite as broadly as you state it in your last proposition.

Q. But legislation has been in the direction of removing the tax on literature. I agree with you entirely in what you have said, and I think the tax ought to be removed as far as possible. But there has been some liberal legislation in that respect?—A. Very little; nothing reaching the individual. A feeling of shame has come over the country in regard to the administration of the laws, and people who take the pains

to learn it (I do not think many know it) can get foreign books without paying the duty; not by cheating the government, or by any other underhand process, but the government is ashamed to enforce the law, and they will allow you to receive books through the post. I imported some books from Germany, France, and England through the post. I found myself in this position: I wanted these books, and I wanted to know how much I should have to pay for them. I found that if I bought them of the importer I should have to pay two to one for them, whereas if I could receive them through the mail I should not have to pay nearly so much. So I went and asked how I was to pay the duty. I was told by the authorities at the post-office that I need not trouble myself about that, because they should not collect it, and would not, excepting it became a question of a large quantity. I suppose, of course, they would arrest instantly a dealer who would attempt to get them through without paying the duty, but I found there was a kindly and judicious exercise of discretion towards me. The reason they gave was, that it would not pay them to collect it; that I had a right to receive a book through the post, and that they could not afford to collect it; that they were unwilling to do it unless it was in large quantities.

Q. Do you think the high price of foreign publications can be justly attributed to the duty?—A. That is a matter between the book importers and the purchasers. I do not think the high price is referable to the duty. But all these things are obstacles to the importation of books. When the customer comes to the dealer and complains of the high price, the dealer says, "Oh, it is the odious duty!" and the customer goes away under that impression. Take a German book, for instance, which is exceedingly dear owing to one or two reasons: In the first place, the Germans are not a rich people, and there are very few of them who can afford to buy books; in the next place, they have not the demand the English publisher has of the circulating libraries which buy his books. (I am speaking now of light literature.) So that the German book is exceedingly dear, whether it be of light literature, poetry, romance, or science; and when it comes here the price is doubled. We have an immense German population in this country. They will read; everybody will. It is the solace as well as the culture of the people; it is a comfort. When you exclude what is good they will take what is bad, cheap, nasty, and filthy. You will see this horrible literature upon the news-stands at the corners of the streets, and hawked all over the country. I know very little about it, except from looking at the titles. When I come in at a railway station and see it there I cannot help thinking it is very bad for our youth to read such miserable trash. Every obstacle that prevents the importation of good literature is a premium on the production of the bad, and ought to be removed.

By Commissioner UNDERWOOD:

Q. You do not propose to make any discrimination as to what kind of literature shall be introduced free?—A. No; that does not belong to free governments.

Q. Do they not publish in London and Paris a good deal of this light literature of which you complain, and which you think is demoralizing to the community?—A. I speak of the "Dime Novels," as they are called.

Q. Is that peculiar to our country? Is there nothing of that kind in Europe?—A. Well, if it is proposed that bad literature may come in here from Europe, God forbid that I should stand here and say anything against it. I am perfectly willing; in advocating the case, to admit that everything that is infamous is published in Europe; but I

have yet to learn that it ever can be the wise policy of the government to encourage it. No man has a greater abhorrence of the light literature of France from the time of the second empire to the present day than I have. I do not read it and know very little about it, but its odor is so fetid that even those who do not read it know how repulsive it is. But I do not see in that any reason whatever why we should exclude the good, nor, because the bad may come in, to undertake in this country to have any license laws or censorship, or to say what shall come in or what shall not. The remedy is in legislation. The remedy is in admitting the good, which shall educate the people, and they will turn to them in disgust from the bad. But if you want to have bad literature successful, and have it read, then surround the people with barriers to keep out light and intelligence from them, and they will prefer that kind. The literature of France, especially the light literature, from the time of the second empire down to to-day is as bad as bad can be; so that everybody who has any respect for himself would refrain from reading a French novel, in my judgment. I do not read many novels, and I read no French novels.

Q. Fairly stated, then, your proposition is this: To admit all books, good or bad together, free of duty?—A. I did not say anything about that.

Q. But that is a simple question.—A. You may paraphrase it that way, but I deny it. You may put it in my mouth that I am here to advocate the admission of bad books, but I do not admit it.

Q. I do not want to put anything in your mouth at all. I ask you a plain question, and do it respectfully, for the purpose of ascertaining your position, and you can answer it or not. Is it your proposition to admit all the literature of Europe, the good and the bad, free of duty?—A. I will not answer that, because that is arguing. Will you permit me to say what I think on these questions? I am a free trader. It is an abomination to tax me to enrich somebody else.

By the PRESIDENT:

Q. You can answer the question in any way you please; you are perfectly at liberty to answer the question or not.—A. I am here to advocate the importation of books free of duty; that is my answer.

By Commissioner MCMAHON:

Q. At present books are admitted through the mail by treaty. You spoke of there being no legislation on that subject. It is only within a few years that we have had a treaty, and our postal laws exclude, as you will perhaps remember, obscene literature, &c.—A. Yes, sir.

Q. Would you not recommend that a similar provision be put in the customs laws?—A. Now, when you put it in that way I must say that I was a little inflamed by the paraphrase, but I will say—

Q. Would you favor that or not?—A. From my political principles I would not favor it. I am not in favor of overgovernment. I consider these are the proceedings of despotic forms of government, under which they have oppressed liberty and personal rights and repressed intelligence. Those are my reasons for objecting to it. I am sure there is not a man living who would do more to exclude corrupt literature than I would, or who would be more glad to see measures resorted to that would do it. But I understand the wisdom of these measures; I think they belong to other governments, and we are not wise to imitate them. My theory has always been that these things are better remedied by moral influence than by governmental restraint.

F. R. RAWOLLE.

NEW YORK, *October 7, 1882.*

Mr. F. R. RAWOLLE, of the firm of Marx & Rawolle, of New York, manufacturers of glycerine, addressed the Commission as follows:

Respecting proposed changes and revision in the existing tariff, we respectfully desire to call your attention to the article of glycerine, in which we are largely interested as refiners and distillers, and importers of the crude material from Europe.

Crude glycerine is mostly obtained at present as a secondary or by-product in the manufacture of stearine candles. A small quantity (since January 1, 1881) has also been made from soap-lye waters; and various other (hitherto mostly unsuccessful) attempts have been made to extract the crude glycerine from fats and oils, before the latter have been converted into soap and other articles. Crude glycerine, as thus made, is of various shades of brown or dark yellow color, whereas manufactured glycerine is either white or light yellow color, although, if badly or imperfectly refined and distilled, it may even be of a brown color; or manufactured glycerine may be artificially colored like sugars. Hence, neither color nor specific gravity, nor both, are sufficient criteria to distinguish crude from manufactured glycerines.

Our business consists in refining and distilling the impure crude glycerine, and producing therefrom the pure white and yellow glycerines for drug and manufacturing purposes. The crude material we buy from the stearine-candle manufacturers, partly in this country and partly in Europe, more than 80 per cent. of all the crude glycerine that we have worked at our factory.

The domestic stearine-candle manufacturers produce only about one-third of the total consumption of glycerine in this country. On the other hand, the domestic glycerine refiners have more than ample capacity and machinery to produce all the manufactured glycerine from the crude required in the United States. For the above reason we are unable to buy all our requirements of crude glycerine in this country at any price.

The present duty is 30 per cent. ad valorem, being the same on both crude and manufactured glycerine. This is unfair and unjust, because it gives no protection to us refiners.

In changing the present ad valorem duty we think that the total duty to be collected by the government will remain about the same, without any material increase or reduction, because the amount of duty at the proposed specific rates will and can be collected more efficiently and correctly.

We propose a specific duty of 2 cents per pound on crude glycerine, and 5 cents per pound on manufactured glycerine.

Crude glycerine is defined to be of a brown or yellow color, of 1.2500 specific gravity or less (at the standard temperature of 60° F.) as directly extracted from fats and oils by the stearine candle, soap, and other manufacturers, without having been subsequently purified by the processes of refining, distilling, or both.

Manufactured glycerine is defined to be white glycerine of any gravity, and brown and yellow glycerines of more than 1.2500 specific gravity,

and any glycerine of any gravity which has been wholly or partly refined or distilled.

We desire to change the present ad valorem into a specific duty, because:

1st. The difficulty and almost impossibility of determining the foreign market value of glycerine.

2d. The injustice of the present law, which compels us (when we have been so fortunate as to buy at low prices) to add value in order to make market value, and to pay duty thereon; but, on the other hand (when we are unfortunate to buy at high prices), and market value becomes lower than our contract prices, we are compelled to pay duty on our contract prices, and not on market value. This is a poor law which does not act both ways, and from which we have been suffering for some time past, and thus doubly increasing our misfortune, when losing money on depreciation of our goods. To this matter of market value we would specially and urgently call your attention.

3d. To protect ourselves and the government against frauds by undervaluation.

4th. The present inadequate and almost entire want of protection in the duty on manufactured glycerine, because, as before stated, the present ad valorem rate of 30 per cent. is the same on both crude and manufactured glycerine.

We propose a specific duty of 2 cents per pound on crude glycerine, so as to give fair protection to the stearine-candle manufacturers, who at present are the only ones producing crude glycerine in this country.

As a matter of course, a duty on crude glycerine makes necessary a duty on manufactured glycerine, and this latter should be at least 5 cents per pound, or say at least 3 cents per pound more than the former, because:

1st. The extra labor and cost to make the manufactured glycerine, our rents, wages to laborers, salaries to clerks, interest, many and expensive repairs to machinery, and general expenses for conducting business, are fully double what they are on the Continent of Europe, from whence about 99 per cent. of the manufactured glycerine is imported.

2d. There is a wastage of about 25 per cent. in producing the manufactured from the crude glycerine, and on which wastage we have to pay duty. This is an important item, and must not be overlooked.

3d. The freight, insurance, and banking commission which we have to pay on this 25 per cent. wastage.

4th. The greater cost in this country than in Europe of the packages in which manufactured glycerine is imported, such as glass bottles, tins, and cases.

5th. The great advantage which the foreign refiner has over the domestic one. The former being on the spot in Europe, is naturally able and does buy his crude material cheaper than we American refiners can buy it there.

During the past eleven years, from 1871 to 1881, inclusive, the average price, free on board European port, was for crude glycerine 75 francs per 100 kilograms, and for manufactured glycerine 160 francs per 100 kilograms.

The duty on said crude was 75 francs \times 19.3 cents (220 pounds \times 30 per cent.) = 1.974 cents per pound.

The duty on said manufactured was 160 francs \times 19.3 cents (220 pounds \times 30 per cent.) = 4.211 cents per pound.

However, during the year 1881 the average price was for crude glycerine 155 francs per 100 kilograms; and for manufactured glycerine 215

francs per 100 kilograms, yielding a duty on said crude of 155 francs × 19.3 cents (220 pounds × 30 per cent.) = 4.079 cents per pound, and a duty on said manufactured of 215 francs × 1.93 cents (220 pounds × 30 per cent.) = 5.658 cents per pound.

During the eleven years of 1871 to 1881, inclusive, the difference in the duty between manufactured and crude glycerine was 2.237 cents per pound, whereas in 1881 this difference was only 1.579 cents per pound; and there is every reason to believe that in the future this difference will become still smaller, and consequently the present ad valorem duty will even be less adequate as a protection on manufactured glycerine.

To prove how the tariff affected us in 1881, we give the following detailed calculation :

	Cents per pound.
25 per cent. wastage on duty of 4.079 cents per pound on crude.....	1.020
25 per cent. wastage on freight (10 cents), insurance (2 cents), and banking (3 cents)150
Difference of labor and expenses	2.250
	3.420
Difference in duty between manufactured and crude glycerine in 1881 was....	1.579
	1.841
Loss to American refiners.....	1.841

As before stated, if the specific duty on crude glycerine be 2 cents per pound, then there should be at least 3 cents per pound more, or 5 cents per pound total duty on manufactured glycerine, which difference of 3 cents per pound we calculate as follows:

	Cents per pound.
25 per cent. wastage on duty of 2 cents per pound on crude.....	0.50
25 per cent. wastage on freight, insurance, and banking15
Difference of labor and expenses	2.25
Margin for the American refiner.....	.10
	3.00
Total	3.00

Not including difference in cost of packages, and not including the great advantage the foreign refiner has over the domestic one in being able to buy his crude glycerine cheaper in Europe, as before explained.

We also wish to call your attention to the present law of duty on packages. A part of the crude glycerine which we import is in old petroleum barrels, for which no charge is made, and on which we consequently pay no duty, but the larger part of our importations is made in iron drums (made at Paris, France), so as to avoid leakage, and on which drums we pay duty. Now, as we receive many more of these iron drums than we can sell here, and so as to utilize them, we have for some time past shipped back these drums, when empty, to Europe, there had them refilled with glycerine, and then again reshipped such filled drums to New York, and each time we have been obliged to pay duty over and over again, which we do not think is just. Hence, we propose that foreign packages on which duty has been once paid shall have the privilege of being sent back to Europe, and thence reshipped to this country time and again without being obliged to pay duty a second time, by keeping a proper account and registry at the port of entry.

If our above proposed change of the present ad valorem duty in a specific one be not accepted by you, then we desire that the present ad valorem duty of 30 per cent. on both crude and manufactured glycerine be changed to 15 per cent. ad valorem on crude glycerine, and 35 per cent. ad valorem on manufactured glycerine, so as to give us re-

finers in the United States the necessary and required protection on our manufactured glycerine. And further, that said new proposed ad valorem rates be levied on the market value in Europe at the place where such goods are produced (and not at the port of shipment), no matter if the contract or purchase price actually paid be above or below such market value.

Lastly, by the present law we are obliged to pay duty also on 3 per cent. commission added whereas we buy our goods at net prices, all charges and commissions included. We think that it is unjust to compel us to pay duty on commissions which we do not actually and really pay. We therefore suggest that this law be changed, and that in future duty shall only be levied on commissions when they are actually paid by the importer on his purchases, and that no duty shall be levied where such purchases are made at net prices in which all charges and commissions are included.

To recapitulate, we propose—

1st. Specific duty of 2 cents per pound on crude glycerine.

2d. Specific duty of 5 cents per pound on manufactured glycerine.

3d. Foreign packages on which duty has been once paid, when shipped back to Europe and thence reshipped to this country, shall be free, and shall not pay duty a second time.

4th. Ad valorem duty shall be levied on market value in Europe, no matter if the purchase price paid be above or below such market value.

5th. No duty shall be levied on commissions, no matter whether such commissions be actually paid by the importer on his purchases or not.

We think that the above proposed changes in the present tariff are fair, just, and equitable, and will meet with the full and cordial approval of all interests concerned.

By Commissioner McMAHON:

Question. Is it ever a matter of question or dispute where glycerine ceases to be crude and becomes refined?—Answer. It would be, because you can color it artificially, and to the unpracticed eye it cannot be detected; but if you will examine the chemical quality you can always tell whether it is a manufactured goods or not. If the goods are adulterated so as to make them appear like crude goods it spoils them, and they cannot be used.

Q. That is to say, they cannot adulterate or manipulate the refined glycerine in any way to enable them to bring in refined as crude glycerine and make anything by it?—A. No, sir.

Q. Then you would recommend that your definition be embodied in the law?—A. Yes, sir; I do. I have spent a great deal of time making that distinction accurately so that the government and the manufacturers would not be swindled. It is our interest to do so.

A. H. ANGELL.

NEW YORK, *October 7, 1882.*

Mr. A. H. ANGELL, of New York, addressed the Commission as follows:

GENTLEMEN: The undersigned were, at a meeting of the whiting and Paris white manufacturers, held in New York City, 17th August, 1882, appointed a committee to present to your honorable body facts and statistics relative to these manufactures, and the views of the manufacturers regarding the duty to be imposed on these articles when imported.

The committee beg leave to state that there are twenty-three manufacturers of whiting and Paris white in the United States, twelve of whom are located in and around New York, the remainder being at Boston, Philadelphia, Providence, and Hallowell, Me.

Whiting being among the lowest grade of goods in value, the capital employed is large in proportion to such value, while the process of manufacture is such that in case the business should be destroyed by reason of a change of tariff or otherwise, the plant would be valueless for other purposes, and the capital invested become extinguished and lost, or nearly so.

The entire cost of whiting beyond that for the raw material (chalk), and the cost of capital, depreciation of property, and wear and tear of machinery (when the latter is used) incident to all enterprises, is represented by labor, and the wages paid vary from \$1.50 to \$2.50 per man per day, with nothing in the process injurious to health. While the labor employed cannot be classed as "skilled labor," there is required in the workmen a liberal intelligence, which, combined with experience, elevates the grade of labor, position of laborer, and value of services largely above the plane of the ordinary "day laborer." With the exception of Paris white, the value of the labor represented in whiting is, without doubt, greater in proportion to the value of the product than that of any other articles produced in this country. In most of the factories the men have been employed for years, and being unskilled in other avocations or duties requiring their measure of intelligence, and affording corresponding wages, they would, in case of suspension of these industries, be reduced to a position commensurate with the shovel, wheelbarrow, and hod.

Various statements concerning whiting and Paris white have been made by writers and speakers upon the subjects of free trade and tariff, and also by importers, who have appeared before your honorable body. With none of these do we charge or believe that the statements made were knowingly incorrect, but from lack of practical knowledge of the subject, and in some instances a partial statement of the facts by these advocates, not only yourselves, but the public, are liable to be grossly misled. We will cite one instance where it is stated "one cent per pound duty on whiting was equal to 476 per cent. ad valorem, and the same duty on Paris white was equal to 256 per cent." Even were the prices quoted and percentages computed correct, without some further explanation the totally false and unjust inference would be that the consumer is paying this large percentage as a profit to the manufacturer.

Let us state the facts as they exist. For the last five years the average price of whiting has been from 50 to 60 cents per 100 pounds, or about five-tenths to six-tenths of a cent per pound—*about one-half of the present duty*—and within this period the price has at times fallen so low that manufacturers have found it necessary to protect themselves from loss by agreeing upon a minimum price at which to sell their goods. At such times the quite universal sentiment expressed by dealers and consumers was, that the prices proposed were reasonable and satisfactory to them; that what was desired was stability and uniformity of price, and the avoidance of fluctuations liable to prevail from temporarily overstocked markets, followed by scarcity and comparatively high prices caused by suspension of operations by manufacturers. “The money value is comparatively so small that we do not regard this so much as to know what we can depend upon,” briefly paraphrases this sentiment.

Prices in England have already been quoted to you by importers as, whiting, 20s. per ton, or 21 cents per 100 pounds; Paris white, 36s. per ton, or 30 cents per 100 pounds. Freights to New York are 12s. to 13s. 6d. per ton, or \$3 to \$3.35.

Previous to the establishment of the present duty on these articles, the fluctuations in price were wide and violent. From \$1.25 per 100 pounds the price of whiting would fall to about 30 cents, and naturally rising again to high figures, would fluctuate continually between the extremes. The price was subject to the vicissitudes of short or over supply, and these were again largely regulated by the ruling rates of ocean freights. “Corners” were liable at all times, and of frequent occurrence, and the very conditions which dealers and consumers so much seek to avoid were always present, creating an element of uncertainty which is now wholly obviated. That the mass of consumers are satisfied with the present condition of these branches of manufacture is evident from the almost entire absence of argument before you for a change in tariff by this directly interested class, numbered by the thousand, while the most elaborate figures are arrayed by importers (who can nearly all be enumerated in a single breath) to exhibit to you the iniquities (?) of the present tariff, without allusion to its salutary effects, as shown in the foregoing.

Chalk is brought from England duty free, and varies in price according to the demand for ballast by vessels coming to this side for freights. Whiting and Paris white are not classed as ballast. They are in packages and subject to the fluctuations of freights much more than articles regarded as strictly ballast. This fact aids manufacturers of whiting in this country to maintain the desired uniformity of price, and to contract for yearly supplies with large consumers at prices satisfactory to all.

It is apparently anomalous to find a manufactured article selling for about half of the tariff duty; but it is nevertheless true that the price of whiting has so averaged in the market since the adjustment of prices under the present tariff. From the large increase in manufacturing facilities, and capital invested during the past ten years, it is practically impossible for a different condition of things to prevail.

The present consumption of whiting in this country is about 250,000 barrels, or, say, 87,500,000 pounds.

The foregoing regarding whiting applies equally to Paris white, except that the cost of the latter is much increased by the greater outlay for machinery, additional and higher-priced labor, and about double the cost for raw material. We append to, and submit as a part of, this

paper a letter from Mr. H. F. Taintor, a large manufacturer of Paris white in this country, giving more fully the details of this branch of manufacture.

We would here state that a specific duty of one-half a cent per pound might afford proper protection to the whiting industry but for the fact that Paris white is so nearly identical in every way with whiting, although the latter is not a substitute for the former with consumers. As this would be inadequate to the protection of Paris white, we respectfully but urgently request that in case your Commission should find it advisable to recommend a change of duty on these articles, a specific duty of three-fourths of a cent per pound be named on each, otherwise (the duty being one-half a cent on whiting and three-fourths cent on Paris white), the latter would be imported as whiting, thereby causing unlimited trouble in classification, and the confusion regarding the tariff (now so universally complained of, and to relieve which was a prominent reason for the appointment of your honorable body) would be "worse confounded" so far as regards these two commodities; and if passed as whiting would work serious injury and injustice to the Paris white manufacturers and honest importers. Chalk and cliffstone, the respective bases of whiting and Paris white, are chemically the same—to wit, carbonate of lime—hence no chemical tests by customs officials will avail. The finer grades of whiting so nearly resemble Paris white in appearance that the most skillful are liable to be deceived. The only reliable tests are by the practical workers in these materials, which tests naturally come too late to aid the government officer in his efforts at discrimination, or save the Paris white manufacturer and conscientious importer from the disaster which would certainly be wrought by such frauds in entry, and which it would be impossible to detect or prevent.

The principal question involved is that of protection to labor. The English workman in such factories receives equivalent to 50 cents per day. Shall our workmen be sacrificed in their honestly earned independence, and be reduced to this standard to satisfy the demands of a few desirous to extend their lines of commerce? We have, as we believe, shown to your honorable body that the strong existing competition among American manufacturers has in the past and may in the future be absolutely relied on to restrict the profits of the manufacturers, and regulate the cost of their products to the consumer, and that consumers are content with the situation as it is and has been since the introduction of the present tariff. This duty was placed by Congress with a full knowledge of existing facts, to wit, that liberal protection was necessary. Men, some of them devoid of means, but basing their faith on the protection and guarantees thus afforded by the government, have spent years in building up a small industry by their own toil in their factories alongside of their paid laborer, and have been content and without ambitions beyond such as are met by the legitimate fruits of frugality and industry as yielded by this meager pursuit. The question seriously arises with the committee whether, when showing, as they claim to have shown, that no interests have suffered, but that all have been conserved to a higher degree than when under no protection, strictly good faith on the part of the government either towards producer or consumer warrants the destruction or impairment of these industries by a reduction of the duty to a point that will admit foreign products to our markets on equal terms. When the sentiment of the country, expressed by a majority, shall rule in favor of free trade, we will gracefully accept of the verdict; but until such time shall come we cannot too

strongly ask your Commission for such recommendations for our protection as we have herein suggested, being convinced that in such requests we are not transcending the limits of our apparently reasonable and just claims.

The market value of the 250,000 barrels, the estimated yearly production, averages, say, \$2 per barrel, or \$500,000 total.

We will call your attention to but one other point, and that briefly. The present tariff on "prepared" chalk is 25 per cent. ad valorem, and it is intended to cover very fine preparations of chalk used for special purposes, of which very small quantities are imported or required. The entire consumption of the country is from 30 to 50 tons yearly. As the term "prepared chalk" has led parties to assume that whiting was nothing but prepared chalk, and the duty on whiting sought to be evaded in this manner, we would further suggest that the duty fixed upon whiting should cover all preparations of chalk, or, if necessary to make a distinction, that the tariff should read "twenty-five per cent. ad valorem upon prepared chalk, the invoice value of which shall not be less than three-fourths of a cent per pound."

Respectfully,

JAS. L. TRUSLOW, New York,
L. RICHARDSON, New York,
JOHN J. BUDD, New York,
A. H. ANGELL, New York,
JAS. W. STICKNEY, Boston,
E. F. DUNCAN, Philadelphia,
Committee.

The following is the letter from Mr. H. F. Taintor referred to in the foregoing statement:

GENTLEMEN: Permit me to present to you briefly a few facts regarding the manufacture of Paris white, in which you are aware I am largely interested, for the purpose of laying before the Tariff Commission such information as will enable them to reach an intelligent and just judgment in their considerations of this industry.

The present cost of a plant, equal to that in my Paris white factory, would be \$50,000 independent of ground or buildings. It is not adapted to any other manufacture, and from its character would be of insignificant value for other purposes.

The cliff-stone, from which Paris white is made, is brought from Hull, England, duty free, and varies in price from \$2.50 to \$5 per ton delivered in New York. It serves as ballast from a port where very little freight is to be had. The chief element of cost in its production is labor. The process used to *complete* whiting is but the *preliminary* one in manufacturing Paris white. Up to this point both processes are identical, to wit, the crushing in water by machinery and floating off into vats. Paris white then requires a very careful and slow grinding by mill-stones—the skill and care required in this grinding being equal to that called for in the preparation of wheat flour. The men receive from \$1.50 to \$3 per day—many of these having been thus employed from five to twenty-five years.

This commodity is of such similarity in character and uses to whiting that they are universally classed together in trade, and when considered from an economic point of view. The same holds true in manufacture. Out of the six establishments producing Paris white in this country, each one has combined with it the manufacture of whiting. As

the duty of presenting to the Tariff Commission the general facts concerning these industries devolves upon you, and having entire confidence that you will honestly and intelligently present such facts, and relieve the Commission from the erroneous and unjust conclusions which they cannot but reach from the partial statements of those interested, and impracticable ideas of those who preach theory while ignorant of the simplest facts, I shall but state that the same proportions which the average price of whiting bears to the rate of duty holds equally true with Paris white, taking into consideration the greater cost of capital, machinery, raw material, and labor, the latter being by far the most important element.

The price for some years has ranged from 90 cents to \$1.30 per 100 pounds, according to skill, care, and labor used in its manufacture. This is but a small average advance over the duty, and gives evidence that the consumer is not paying to the manufacturer that tribute which those pecuniarily or theoretically interested in the destruction of these industries would have the Commission believe.

Respectfully yours,

H. F. TAINTOR.

NEW YORK, *October*, 1882.

By the PRESIDENT:

Question. What is the difference between Paris white and whiting?—
Answer. One is made from chalk and the other from cliff-stone. Cliff-stone is evidently another formation of the chalk, being more like limestone or granite. They both analyze about the same, being carbonate of lime. After the process of manufacture they are chemically about the same, but for the uses to which they are applied in the different industries, Paris white can be substituted in a great many cases for whiting, but whiting cannot be substituted except in a few cases for Paris white. Picture frame manufacturers and gilders, for instance, cannot use Paris white in their manufactures, but do use whiting. The wall-paper manufacturers and manufacturers of fine gossamer rubber clothing cannot use whiting, but must have the best Paris white. The oil-cloth men also require Paris white, although they use portions of whiting in their manufacture. It is only in actual use that the difference can be ascertained. We had a case before the custom-house two or three months since where a party imported an article from Sweden which he attempted to introduce as prepared chalk, and there were several manufacturers called as witnesses and samples were produced, and in connection with it we had samples of Paris white and different grades of whiting, and there were scarcely two of the manufacturers who could agree upon what the sample was, some thinking it was Paris white and some whiting. You can tell the grade by the color, whether it is a high grade or not, but to tell whether it is a preparation of chalk or cliff-stone is almost impossible except in actual use. That is one reason why we refer to the matter of the tariff duty being made at $1\frac{1}{2}$ cents on whiting and Paris white, although the manufacturers would be satisfied to have the present duty reduced one-half; that is, made $\frac{1}{2}$ a cent a pound instead of 1 cent a pound. But you can understand what confusion would arise in the importation of these articles, because Paris white could be imported as whiting, and it would be almost impossible to detect it, and it would create confusion and annoyance and complaint from the Paris white manufacturers and the custom-house officials.

Three-quarters of a cent a pound would protect the Paris white manufacturers, and at the same time would not add anything to the cost of

the whiting to the consumer, because the price has ruled from 50 to 60 cents for years, which is about one-half of the present duty. The present price of whiting for the lower grades is about 40 to 42½ cents a hundred, and for the higher grades 65 cents. In the average production there is about one-third of the better grades made and two-thirds of the lower grades, which brings an average not to exceed 50 cents a hundred, which is only one-half of the present tariff.

Another point I would like to speak upon is this: If the duty should be so fixed as to barely cover the cost to the manufacturer here, so that the imported article could be brought in at just about the same price it costs the manufacturer here, with a trifling profit we will say, then there will be a great deal of trouble arising from the fact that the manufacturers on the other side always accumulate large stocks, and it is their wish, and always was during the time whiting was imported here without duty, to rush into this market large quantities of their surplus stocks and sell it at the best price they can get, because being a low-priced article it does not bear the additional expense of storage and cartage like the higher priced goods. It would demoralize the whole trade. The manufacturers here at one time might be able to get a fair profit on their goods, and at other times goods would be rushed in from abroad and the market be completely demoralized. When whiting was brought in free, at times it sold at \$1.25. A few people controlled the business and they put up the price so as to make a large profit.

Q. That was before the extensive manufacture began here?—A. Yes, sir; the manufacture has increased in this country so that now it would be impossible to control the price in that way. Within the last few years there has been an actual loss of 5 to 10 cents a hundred pounds to parties who chose to sell it on account of competition and dull trade.

Q. In other words, before the manufacture was established here foreigners controlled the market, and since then they have been unable to do so.—A. Yes, sir.

By Commissioner GARLAND:

Q. How many establishments are there in this country engaged in this manufacture?—A. Twenty-three.

Q. What is the amount of capital employed?—A. In the manufacture of both whiting and Paris white about \$450,000 to \$500,000; say \$20,000 on the average to each manufacturer.

Q. How many hands are employed?—A. We have seventy-two men employed in the manufacture of whiting and Paris white.

Q. I mean how many are employed by all the manufacturers?—A. I should think possibly 1,000 men altogether. Paris white and whiting are articles of limited demand, and the production compared with the amount of capital employed is very small.

JOHN ROACH.

NEW YORK, *October 7, 1882.*

Mr. JOHN ROACH, of Chester, Pa., addressed the Commission as follows:

MR. PRESIDENT AND GENTLEMEN OF THE TARIFF COMMISSION: I come before you to state some facts that have fallen under my observation in the fifty years of my practical connection with our industrial interests. I have been identified with the iron interest in all its branches, from the digging of the ore in the mine to putting it into the varied forms and shapes of manufacture and machinery. To-day I employ 1,000 workmen in the city of New York, and 2,000 more men and boys, skilled and unskilled labor, in the ship-yard and iron-works at Chester, or 3,000 altogether. These, with their families, represent at least 12,000 people dependent on my employment for their support. My pay-roll is \$12,000 a week in New York and \$21,000 in Chester, or \$33,000 a week total. These men represent all nations, and are engaged in forty branches of mechanism. I am familiar with their condition now and with what it was before they came to this country, and the wonderful change that has taken place in that condition speaks volumes for the results of our policy of protection, which has made our land seem as a heaven on earth for the immigrants of the world; and I am familiar, too, with all the branches in which they are engaged. I am here, gentlemen, not to speak for any special branches of industry, but for all our industries. I have no special plea to make for ship-building. In what I shall say, drawn from practical experience, I represent myself alone, but myself as engaged in four of the principal interests affected by the tariff; namely, farming, manufacturing of iron, ship-building, and ship-owning. I believe in protection, not for a single industry, but for one and all, because I believe in the principle of protection.

What was the occasion for the creation of our present tariff laws? They were created to meet the emergencies of our civil war, to develop our country, and to elevate labor. How have they answered the purposes of their creation? To answer this question intelligently, we must see what was our condition in the early years of their operation, and what progress we have made under them. I ask your careful attention to the following striking facts.

What was our condition in 1865, at the close of the war? Our country was crippled, half of it largely devastated, a large part of the population of the conquered sections without employment, and a disbanded army of men in much the same unemployed state in the North. Our credit was largely impaired, our currency being worth only 70 cents on the dollar. We had before us, like a vast mountain, a national debt of \$2,680,000,000 to pay off. Starting with such disheartening conditions, what have we done under our tariff laws?

On that debt in the seventeen years since 1865 we have paid in inter-

est \$2,047,500,000, besides a premium on gold of \$409,500,000. Putting these figures in the form of a table we have this remarkable showing:

National debt, June 30, 1865.....	\$2,680,000,000
Interest paid on debt from June 30, 1865, to June 30, 1882.....	2,047,500,000
<hr/>	
A total amount of.....	4,727,500,000
Deduct total national debt, June 1, 1882.....	1,639,000,000
<hr/>	
And we have actually paid in the seventeen years.....	3,088,500,000
Add now to this the premium paid on gold in those years up to 1879, and we have.....	409,500,000
<hr/>	
Or a grand total payment of.....	3,498,000,000

Think of it; nearly 3,500,000,000 of indebtedness paid off since 1865, starting from an almost bankrupt condition as a nation. Then consider our State, county, and municipal debts that we have paid. If I were in a similar condition, I should like to have somebody take my property and bring it out for me in such shape as this; wouldn't you? No wonder the nations of the world that knew of our condition when the war was over have marveled at what we have done since then. For our achievements in nearly all directions have been equally great with our debt-paying. Our progress has been great almost beyond belief. Our manufactures have increased till in 1880 they reached the enormous sum of 8,000,000,000, while besides this we have every year imported manufactured goods—last year to the extent of \$300,000,000. And this does not take into account the equally marvelous development of our agricultural interests, the opening up of new territory, the vast extension of railroads, and such a general onward march of national enlargement and prosperity as the world never saw before. All this has been done under our wise tariff laws, under the true principles of protection for home industries. I ask the free-trader, the tariff-for-revenue man, and the croakers altogether, in view of the facts, if these tariff laws have not worked well for the country's interests. I ask them to say wherein they would have had them work better. I challenge them to show how we could have made such a record under free trade or a tariff for revenue.

To show with what apprehension English economists and manufacturers looked upon our progress under our tariff, read this testimony from British sources:

A. J. Wilson on "Resources of foreign countries."

There is no use in denying the plain fact that the States have succeeded by their high tariff policy in diverting a considerable part of the industrial energies of the community from the pursuits natural to, and most profitable in, a new country, to the highly artificial and, for America, mostly very expensive industries of long settled and civilized nations. Were the sheltering tariff swept away, it is very questionable if any, save a few special manufactures of certain kinds of tools, machinery, railway cars, and fancy goods, and a few of the cruder manufactures, could main their ground.

Annual Liverpool cotton circular.

Then this country has suffered very severely of late years from the increasing stringency of foreign tariffs. There has been a growing tendency evinced in most countries to protect their own industries, and in every such case we are the chief sufferers, for we live, as already said, by exchanging our manufactures for the necessaries of life. The United States was at one time a large customer for our ironware and textile fabrics, but the hostile tariff she has enforced since the civil war, has nearly driven us out of her markets, and has built up a vast system of manufactures which completely supplies her own wants, and leaves something to spare for competition with us in foreign markets. The free-traders of this country console themselves by thinking that she is the chief sufferer, but whether this be so or not (which is very doubtful)

the fact remains that her markets are almost lost to us, and we, on the other hand, are constantly more dependent upon her for food and raw material. For this we have no means of paying except by money or bonds, or indirectly by our credits with China, Brazil, and other countries, from which America imports tea, sugar, &c. Our colonies all follow in the wake of the United States, and do their best to stimulate their own manufactures by closing their markets against ours.

London cablegram to New York Tribune.

The announcement of the introduction of bills in the House of Representatives at Washington proposing the reduction of iron duties rouses the liveliest hopes among British manufacturers. Leading journals in the iron districts hail the prospect of once more arresting the present development in American iron and steel manufacture. The Newcastle Chronicle declares it has reason to entertain great hopes of the success of these measures. It considers the free admission of iron ore as intended to secure a Canadian supply, but it would result in increasing the ore imports from England and Spain. If free ore were secured free coal would necessarily follow, with a general increase in English exports. The Chronicle declares these measures to be the most important news cabled for a long time. The Economist says the effects upon the English iron trade would be enormous. It fears lest the proposals may be too favorable to English trade to have any chance of adoption.

Here, in these extracts, you have the honest views of men working in the interest of English capital and labor. Honest, because every step in this country towards withdrawing protection from American interests "rouses the liveliest hopes among British manufacturers." Why is that the case, may I ask you? Is it not, should a reduction of the tariff laws be effected to such an extent that Englishmen would "hail the prospect of once more arresting the present development" in American industries, that American capital would be supplanted with British, and the payment of remunerative wages to laborers with the starvation pittance of Great Britain? You have listened to long and able arguments on the part of free-traders, but wherein do their pleas differ from the foregoing expressions of Englishmen? Are they honest friends of American labor, or are they allies of foreign capital and labor?

I do not doubt, gentlemen, that with the change of our condition, modifications and changes in our tariff laws have become wise and necessary. To suggest those modifications is the duty laid upon you. I do not know of any commission of nine men that ever had imposed on them a duty more trying or a responsibility more grave. Upon what is done with our tariff laws depend the prosperity and advancement of our fifty millions of people. The just and right execution of your delicate and difficult task will entitle you to a nation's gratitude.

The system which you will perfect will put an end to all occasion or excuse for the continuance of the internal-revenue war taxation, which is not only a heavy burden upon the industries directly concerned in its operation, but paralyzes some of our most interesting and useful manufactures and diminishes by many millions our annual exportation to South American and other countries whose trade is naturally ours.

To call your attention now to the first of the four industries which I named, I want to speak briefly of my interest in the tariff as a farmer. I have for thirty years farmed 400 acres of land, and now farm 1,100 acres. It was studying the wonderful advantages the farmer derived from having the manufacturing industries developed at home that made me what I am to-day, a protectionist, believing in the protection of every great industry till it is developed to a point where it has an equal chance in competition in the world's markets, and believing that protection should not be limited to a tariff for revenue only, or anything short of what will elevate and protect American labor. As a farmer I had confidence in these forcible words of the great philosopher, Dr. Benjamin

Franklin, who, after his close observations in England in 1791, wrote from London to Hon. Humphrey Marshall, sr., as follows :

Every manufacture encouraged in our country makes a market for produce within ourselves, and saves us much money to the country that must otherwise be exported to pay for the manufacture supplied.

Here in England it is well known and understood that wherever a manufacture is established which employs a number of hands it raises the value of land in the neighboring country all around it, partly by the greater demand near at hand for the produce of the land, and partly from the plenty of money drawn by the manufacturer to that part of the country.

It seems, therefore, the interests of our farmers and owners of land to encourage our manufactures in preference to foreign ones imported among us from distant countries.

Here is a list of the working teams, cattle, and tools I use on a farm of 1,100 acres, 500 acres of it under cultivation—wheat, rye, oats, corn, and grass :

8 horses.....	\$1,600 00
3 yoke of cattle.....	480 00
3 ox carts.....	165 00
4 horse carts.....	200 00
4 farm wagons.....	300 00
1 market wagon.....	100 00
8 sets harness.....	320 00
4 sets cart harness.....	100 00
1 mowing machine.....	90 00
1 reaper.....	110 00
12 forks.....	10 00
12 shovels.....	9 50
6 spades.....	6 00
Lot of sundries.....	100 00
1 roller.....	40 00
Plows and harrows.....	125 00
1 thrashing machine.....	450 00
	4,205 00

If the tariff were entirely abolished the farmer would not think of importing his horses, oxen, mowing machines, reapers, thrashing machines, or farm wagons. Out of the above articles he would not import over \$1,300 worth.

Suppose these \$1,300 worth cost 40 per cent. more caused by our tariff; that would amount to \$520. All those articles are good for ten years, so that his entire burden on an 1,100-acre farm would be \$52 a year. Compare this with the advantage to him of having a home market. His neighbor, who makes these articles for him, pays him more for his product, his children and family are better fed, educated, and clothed than any people in the world engaged in the making of farm implements. The farmer, when he understands the benefit of protection, will be no longer deceived by the men who are preaching free trade to him.

And I believe, too, with Andrew Jackson, the hero of the Hermitage, when he says, "Build your factories and workshops close to your plantations and your farms, and you will confer inestimable and innumerable blessings on the whole of the American people by that policy." Do these words mean that we shall take the product raised in Tennessee to Great Britain, 3,500 miles from the plantation, to reach the factories? Or that we shall buy iron from the mines 3,000 to 4,000 miles away and leave the ore undeveloped in our own inexhaustible mountains? No, they mean that Jackson knew that by doing both the raising and developing and manufacturing at home we should confer inestimable bless-

ings on our people. He recognized God's plan in making men fit for a diversity of employments, and that if this nation were to become great it must furnish employment within itself for all these diversified gifts. This idea is the very bottom principle of protection. What has not this principle done for us? It has started all sorts of industries, to suit all kinds of genius found among our people.

When the charge is made, as it so often is, that protection is for the benefit of the few at the expense of the many, and that it makes the farmer pay more for the tools he uses and the clothes he wears in order to put profits into the full pockets of wealthy manufacturers and monopolists, I recall the wise words of Franklin and Jackson which I have quoted, and think there is another side of the question for the farmer to consider. I ask you, gentlemen, and I ask the farmers, to compare the different sections of our country, and see what was the result in those States that followed the idea of these statesmen, and then see the difference in those States that did not heed it.

Look at this farming question a moment. It is charged that the farmer suffers great extortion from the enormous prices he has to pay under the tariff for carrying on his farm.

I have calculated the implements and outfit necessary to carry on an 1,100-acre farm, and find the list to be as I have shown you.

This, then, is the burden I suffer under our tariff laws; and the average endurance of these implements is ten years.

But I have learned that to have a town within eight or ten miles of my farm, with factories employing any number of hands, increases largely the value of the land around the whole circle, as Franklin says. One of my farms is five miles south of Poughkeepsie, and six miles north of Wappinger's Falls. In each of these towns are some iron works, shoe factories, and cloth factories. Hence, no matter what the price of grain is in the foreign market, I can live, for I have a market at home. The perishable produce that could not be sent to a foreign market is sold at home for five times what it costs me to bear the tariff burden on my tools and clothing. How many farms all over the land are in the same condition. The farmer is largely dependent for his profits on the home market that is furnished by the industries which protection has enabled us to establish; and no man is more interested in the work of your Commission, and in the maintenance of a just and equitable tariff, than is the farmer. By the building of manufacturing towns all over our land, who can estimate the value that has been added to the farms of the nation?

A few facts now on the befogged question of monopoly. Where lies the monopoly? Consider these figures:

Our last year's imports were valued at	\$642,000,000
Of this amount the articles admitted free valued at	202,000,000
And those dutiable at	440,000,000

Now of the principal free articles, let us see what industries were mostly benefited.

Coffee.....	\$56,900,000
Hides.....	27,700,000
Chemicals.....	23,500,000
Ten.....	21,000,000
Rubber.....	11,000,000
Silk—raw, &c.....	12,000,000

Here is over 75 per cent. of our free imports, viz..... 152,100,000

And the manufacturers' small proportion of interest can be clearly seen. The only complaint would probably come from the silk-growers.

Our principal dutiable articles imported are:

Sugar.....	\$90,000,000
Wool.....	45,000,000
Iron and steel.....	51,000,000
Silk.....	32,000,000
Cotton.....	28,000,000
Flax.....	21,000,000
Tobacco.....	6,000,000
	<hr/>
	273,000,000

Here is over 60 per cent. of our dutiable imports, and of this protection who has the monopoly?

Directly, at least 50 per cent. is for the benefit of the agriculturist, and of the manufacturers' share, viz, 50 per cent. indirectly by increased demand and consumption near at hand, employment of labor, development of home interests, wealth and money circulation, we find 95 per cent. benefiting *all* other industries and fully 75 per cent. of which is a clear saving at home to our farmer for his wheat, corn, potatoes, vegetables, chickens, eggs, butter, milk, beef, fruits, &c., without loss of freight, uncertainty and delay by long transportation. Every cent turned over in business to your neighbor leaves a profit to you and conveys the same profit to him.

The farmer should reflect, too, on what would have been his condition had the whole burden of the national debt been thrown on him, as it must have been had not our manufacturing industries been developed under a protective tariff, and thus created a vast property to take its share of the debt burden, besides furnishing the farmer his home market

THE IRON INTEREST.

The iron interest is national, not sectional. To the three great wants of man, bread, clothing, and fuel, must be added a fourth—iron. Look at the condition of man before he had developed iron, and consider now the high degree to which this great industry has elevated him in supplying the other wants—bread, clothing, and fuel. What have the engine, the railroad, and machinery in its many thousand applications done towards the civilization of man? For centuries now iron has been an essential to civilization. The nation that makes no use of iron is a barbarous nation. The nation that cannot produce iron must forever be a weak and dependent nation, without the means of self-defense.

England early recognized the innumerable uses and advantages of iron, and earliest developed her iron interest. She is as far ahead of the other nations in her iron and coal interests as we are in breadstuffs and cotton. Her resources in iron and coal, and the wise use she has made of them, are what have made England the richest nation and the greatest manufacturing nation of the world.

This fact must not be lost sight of, that iron, being one of the necessities to man and nations, like bread and cotton, is something for which no nation can afford to be dependent upon another nation. The nation that produces the iron will inevitably be the greater, and able to control the other. Let us see how iron is distributed and developed among the important nations and the power it confers. From the Annual Report of the Iron, Steel, and Allied Trades of Great Britain to the British Iron Trade Association in 1880 these statistics are taken:

Production of pig iron in principal countries in 1880.

	Tons.
Great Britain.....	7,721,833
United States.....	4,295,414
Prussia.....	1,950,000
France.....	1,733,102
Belgium.....	610,000
Total.....	16,310,349

Thus it will be seen that England alone produced nearly one-half of the total of these five countries, while England and the United States together produced 12,017,247 tons, or three-fourths of the whole. Could we afford to let England's production increase and ours decrease till we, with the rest, should be so almost wholly dependent upon her?

I firmly believe that were it not for iron, and the use we have made of it, you could not hold this immense territory known as the United States under one central government. Then our brethren beyond the Rocky Mountains would have to sail round Cape Horn, 15,000 miles, to come to make laws for the nation, or down the Pacific Ocean, crossing the Isthmus of Panama, again reshipping at Aspinwall to New York. All of our patriotism, love of country, even the influences of the Christian religion, could not control this vast territory under one central government. Our brethren would say we cannot suffer this great inconvenience. We must have a government of our own. With all the great natural advantages of this country, if this resource of iron had been withheld, would we not be apt to cry that the Great Father of the Universe made a mistake in not giving iron to develop the other resources? And when we have the iron, shall we now leave it in the mine undeveloped, and depend on foreigners to supply a material of so vast importance to us, and with no other reason to give, only that we refuse to degrade and crush labor?

There can be but one answer. We must continue to give iron the protection needed to develop the vast resources as yet untouched in the mine. Why, this interest in this country to-day gives employment to one-sixth of our actual working population.

Much is said about "monopoly" in connection with this interest. Indeed, it is called the "father of monopolies." I have been engaged in this interest more extensively, perhaps, than in any other, and I want to find out—for I never could yet—where the monopoly is. In 1880 we imported \$80,483,365 worth of iron and steel, showing that we required that much more than we could produce. Yet capital was perfectly free to go into the production of iron. Why was not the capital found to supply from our own mines and furnaces that \$80,000,000 worth? Moreover, in the ten years from 1870 to 1880 we imported \$430,223,753 worth. Why did we not find capital to produce that supply at home? As a practical iron manufacturer I will show you why. There were three difficulties in the way:

1. *Transportation.*—I have obtained maps of England, Scotland, and Wales, showing the principal iron, coal, and limestone deposits; the iron centers, Ayrshire, Lanarkshire, Cleveland, Cumberland, Staffordshire, and South Wales, and their location and distance to market. These maps show that Great Britain has the ore, coal, and limestone, of which iron is made, in greater abundance within a smaller space than any other nation. Hence she possesses an advantage of location which renders it impossible for other nations to compete with her in the iron industry without protection.

To illustrate what an advantage this alone gives: As these maps show,

the average distance in England, Scotland, and Wales from the place where the coal, ore, and limestone are found to the place where the furnaces are located is from 5 to 10 miles in the Scotch and 8 to 10 miles in the English and Welsh districts. The average distance from the furnaces where the ore is made into pig iron to the home market for consumption, or to the seaboard, is 10 miles. It takes $2\frac{1}{2}$ tons of ore, $1\frac{1}{2}$ tons of coal, and 1 ton of limestone, or 5 tons of raw material, to make 1 ton of pig iron. The average cost in England, Scotland, and Wales of getting this raw material to the furnaces is only 2 shillings a ton of their money, or 50 cents of ours. The cost of transporting the ton of pig iron to the home market or seaboard for shipment is only 50 cents more, or a total transportation cost of \$3, while the cost of shipment to this country is 30 per cent. less from Glasgow to New York than it is from Pittsburgh to New York, the one being by water, the other by rail, and the iron very often being taken by the ship as ballast.

How is it in the United States? The average cost of getting the coal, ore, and limestone—all of which we have in abundance—from where they are found to the furnace is \$2 a ton, or \$10 for first transportation alone, besides the higher cost of labor for mining the ore. To get the ton of pig to the market costs \$1.50 more, or a total transportation cost of \$11.50 against Great Britain's \$3—a difference against us of \$8.50 a ton. It will be seen that this difference in the haul alone in the two countries is more than the \$7 per ton duty now given as protection to pig iron. These facts, deduced from official statistics, cannot be questioned.

I appeal to you, gentlemen, as though I were talking to nine capitalists who were discussing whether they should invest capital in the iron business. If these statements are correct, would you be prepared to put your capital into the iron interest under these conditions?

It is true there are sections of our country where to some extent we have coal and iron ore almost as conveniently located as they are in England, but as yet those sections are undeveloped, are without railroads to make them available to market, and therefore are at present out of the consideration. Thus I have given you difficulty number one, explaining why we imported \$80,000,000 worth of iron in 1880 under the tariff laws, and \$430,000,000 in the 10 years, 95 per cent. of all this being paid to foreign labor.

2. *Labor*.—I am now going to tell you some stubborn facts which I have experienced the last year. In company with some friends I have just completed the construction of a modern blast-furnace at a cost of over \$250,000. Everything that could be done in the compression and reduction of labor was done, and probably there is not a blast-furnace in the world to-day that can produce pig iron with fewer hours and labor per ton. But what is this furnace composed of? Iron, stone, and brick. Take the iron, and what shape was it in when I began the enterprise? Ore in the mine. Where lay the stone? A coarse rock in the quarry. What were the bricks? Clay. You know, gentlemen, the value of clay when you begin to make brick out of it. This ore, rock, and clay, before labor was put into it, was not over 5 per cent. of the furnace's cost. The balance that made up the cost was labor. In England, France, and Germany the cost of this labor is 60 per cent. less than in this country. Hence the furnace built in those countries would cost 60 per cent. less, making the cost of a furnace there \$150,000, while mine cost \$250,000. I shall not go further into the details of the labor question here, but this is the greatest difficulty of all, and this it is that demands protection.

3. *Interest.*—In the sections of the United States that have yet to be developed in their iron interest—as Virginia, Alabama, North Carolina, Tennessee—and in the partially developed States of Pennsylvania and Ohio, the cost of capital would average 8 per cent., or \$20,000 a year on the \$250,000; while in England, France, and Germany it would be only 3½ per cent., or \$5,250 on the \$150,000—a difference in favor of the foreign iron manufacturer of \$14,750 every year against the American enterprise so long as it existed. This is difficulty number three, explaining why we imported \$80,000,000 worth of pig iron in 1880 under our tariff laws, and \$430,000,000 worth in the ten years named. The same difficulties would exist in the case of the woolen mill and all other factories as to cost and labor, high interest and high taxation.

I have thus briefly alluded to three difficulties. These are by no means all we have to contend with. There was another great difficulty that lay in the way of our iron industry's development. It consisted of the great workshops and the vast, long-established iron industry of another people, the English. And yet beyond this, to trouble and frighten away capital, was the constant hue and cry kept up—chiefly by a class having no interest in American development, nor in anything but selling the goods of foreign nations over the counter—in regard to tariff legislation. This kept capital in an unsettled condition, signally disastrous to investment. Yet in spite of all this, American enterprise could not be crushed, and to show you what we succeeded in accomplishing under so unfavorable conditions of competition, I call your attention now to a few figures of iron production:

	Tons.
In 1870 we took from the mines—	
Of ore	3,655,215
To smelt this into pig iron required—	
Of limestone	1,500,000
Of coal	4,500,000
Of coke	1,000,000
	<hr/>
Thus making of transportation more than	10,655,215

In the next ten years to 1880 these figures had doubled.

	Tons.
Thus, in 1880 we took from the mines—	
Of ore	7,709,708
To smelt this into pig iron required—	
Of limestone	3,169,149
Of coal	8,981,553
Of coke	2,277,555

An increase of 98 per cent., making of transportation a total of above 22,000,000 tons furnished merely to change the ore into pig. Have the men engaged in transportation no interest in this?

Shall we leave these 22,000,000 tons of ore, coal, and limestone buried in our own soil, and encourage their development in a foreign land, simply because labor is cheaper, and consequently productions of all kinds cheaper? Will any one say what the effect would be to this nation of drawing each year from our financial resources and sending it abroad to purchase our annual iron supply? Would not this increase the cost of iron in the country we purchase it from?

Shall this transportation, shown to be so immense, be done in this country or in a foreign one? And what would be the loss to our inland carrying trade if this vast freightage from the mine to the furnace were shut off?

Besides, this is only the first freightage; made into pig and into

various forms and shapes, it is then distributed into all parts of the land, to be worked up into all forms for use. So it furnishes transportation again and again until it reaches the merchant's counter. Remember this transportation is labor as well as the rest.

These 7,709,708 tons of material, which were worth but thirty cents a ton in the mine, were increased in value to \$100,557,685 when it had merely been made into iron and steel billets and muck bars.

The value it would attain when worked up into all the conceivable forms for use, from the plow to the knife-blade, from the ax to the surgeon's lancet, and from the ship-plate to the watch-spring, cannot be estimated. But what has been applied to create this value? Labor; nothing but labor.

Now, will the free-trader compute for us the value of this in dollars when worked into all the shapes we use it in; the number of men in all the mechanical trades who draw their support in this country from working up this pig into its various forms and values? Then let him consider the families dependent upon these mechanics and laborers, and tell us what is to become of them if iron and its products are purchased abroad. The principle is the same with many of the other industries. Nothing but labor has increased the value of the iron, from the ore up, and this labor is cheaper in foreign countries; so that, if ore can be converted into iron at less cost, so can all other things that are to be made of that iron. So it all comes back to the bottom question: Will you degrade American labor or will you protect it?

The application of labor to our natural resources is the source of our wealth and prosperity. By the development of these resources, and the providing of our people at home with the manufactured goods they need, how many thousands of towns and cities have been built up from the swamp where the scrub-oak grew to what they are to-day. To the extent we apply this labor we get rich; when we cease to apply it we get poor. Our real wealth lies in the savings, or profits, of this labor.

To dispose of the charge that the protective tariff raises and keeps up prices, and to show that in fact the competition made possible by the tariff reduces the cost, I will give some figures relating to ship iron and steel rails.

COST OF IRON, 1850 TO 1881.

Figures taken from New York prices show that the average price per pound of ship or tank iron from 1850 to 1860, years when we had a low tariff, was:

For ship or tank plate, 4 cents; for flange iron, 5 cents; for angle iron, 3½ cents; for rivets, 5 cents: average of the four classes of iron, 4½ cents.

From 1870 to 1880, years of a high tariff, the iron products of this country increased about 100 per cent. In those years it would be supposed that the increased demand would create an increased price; yet, though wages were higher by 20 per cent. between 1870 and 1880 than between 1850 and 1860, the price of iron was reduced under our high tariff by 25 per cent. This is a positive proof that to have cheap iron we must depend not upon a foreign market, but upon the competition, energy, and enterprise of our own people.

As proof of what I have just said, allow me again to refer to figures taken from official records, which show that from 1870 to 1881 average prices were as follows: Ship or tank plates, 2½ cents; flange iron, 4 cents; angle iron, 2½ cents; rivets, 4½ cents: average of the four classes of iron, 3½ cents, or 25 per cent. less than in 1850 and 1860.

THE GREAT STEEL-RAIL MONOPOLY.

The following shows the price, in sterling and in dollars, free on board, in British ports, of steel rails, from 1863 to 1875, per ton of 2,240 pounds, compiled by Mr. H. V. Poor, of New York:

Year.	£.	s.	Equals.
1863	18	9	\$89 79
1864	17	12	85 65
1865	16	7	79 56
1866	14	10	70 56
1867	13	10	65 70
1868	12	12	61 32
1869	11	6	54 99
1870	10	7	50 37
1871	11	6	54 99
1872	13	18	67 54
1873	16	9	80 05
1874	13	2	68 75
1875	9	2	44 28

Add to the above premium on gold.

Net tons of Bessemer-steel rails produced in the United States from 1867 to 1880, inclusive: 1867, 2,550; 1868, 7,225; 1869, 9,650; 1870, 34,000; 1871, 38,250; 1872, 94,070; 1873, 129,015; 1874, 144,944; 1875, 290,863; 1876, 412,461; 1877, 432,169; 1878, 550,398; 1879, 683,964; 1880, 954,460.

At a valuation of \$65 per ton, this would amount to \$245,961,235. Ninety per cent. of this enormous sum was paid to American labor.

And here comes in the significant fact that before steel rails were made in America those purchased in England for American use were costing \$80 per ton gold, or 30 per cent. more than they are sold for now in America. Who, then, had the monopoly? No one then heard about this great monopoly. When we were sending the gold out of the country, giving employment to foreign labor and allowing our own labor to go idle, was this policy in the interest of this country or of England? We never hear of monopoly in this country until we begin to supply our own wants and cease buying in England. That is what a policy of protection has done for us in regard to steel rails. //

THE LOCOMOTIVE.

Now I want to call your attention briefly to what we have done in building the locomotive. That will show the development of another American industry. Fifty years ago we imported a locomotive engine from England as a sample. I made an examination some time since as to the number of locomotives now in the United States, the cost of their construction, and how it compares with the cost of construction in other countries. The number of locomotives in use in this country January 1, 1879, was estimated at 16,445, valued at \$164,450,000. The number of cars in use, not including palace-cars, was estimated low at 498,000, which would cost at least \$600,000,000, making the value of locomotives and cars together \$764,450,000. Besides, as much as one-tenth of the total now running must have been rebuilt, say five times since 1830, at a cost of \$382,225,000, making a grand total of \$1,146,675,000, which is more than England has invested in ships. But besides this, we have built locomotives for export to all parts of the world, owing to the recognized superiority of the American locomotive.

The Baldwin Locomotive Works alone sent out of the country from 1870 to 1880 over 520 locomotives, 152 of them to English colonies; and

of all the locomotives used in the English colonies from 95 to 98 per cent. were built in the United States.

Estimating what other shops have done, we have exported since 1870 \$20,000,000 worth of locomotives and double that amount of cars.

We have, then, succeeded in building locomotives of such quality and such prices that we have taken England's locomotive business away from her in her own colonies. Is there any reason why, when our ship-building shall be equally encouraged and developed by extending our trade and making a demand for it, we should not build ships for those countries which have not the resources to build them for themselves?

But then we are told that while we can build the locomotive and the car we cannot build the ship, though that is built out of the same material and from the same forest and mine, and though the labor required to convert 100 tons of pig-iron into locomotives is much greater than it is in the finished ship, and just as high-priced. But we had a policy for building the locomotive, by finding a use for it, and you see the result.

THE SHIPPING QUESTION.

III. As for ship-building and ship owning, though they properly come under consideration in connection with the tariff, I will not ask your time now for them, but will submit in separate form, should the Commission desire, what I wish to say on those vitally important subjects, interwoven as they are with nearly all branches of industry.

To show you how intimate and extensive is this connection, I call your notice to the following list of articles required to carry out the contracts I had on hand between January 1, 1880, and January 1, 1882. The list may be a revelation to some of you in regard to what is required in the outfit of a steamship, which is in reality a floating hotel. It will also show what a blow is aimed at our varied industries by the "free-ship" bill so regularly introduced into Congress. Free ships, gentlemen, would do absolutely nothing to revive American ship-owning, but they would be a serious blow to the protective principle. Following is the list:

Pig-iron, 3,450 tons.....	\$86,250 00	
Manufactured iron, plates, angles, bars, rivets, forgings, &c., 47,824,000 pounds.....	1,673,840 00	
Copper, 805,000 pounds.....	193,200 00	
Lead, 127,500 pounds.....	8,925 00	
Lumber, 6,750,000 feet.....	305,000 00	
Coal, 18,000 tons.....	90,000 00	
		\$2,357 215 00
Anchors.....	9,780 96	
Chains.....	22,968 42	
Boats.....	16,650 00	
Life-rafts.....	6,660 00	
Steam-windlasses.....	30,200 00	
Capstans, steam and hand.....	8,200 00	
Life-preservers.....	8,670 00	
Hose.....	4,265 00	
Fire-buckets.....	1,977 00	
Axes.....	300 00	
Deck-lines.....	14,736 80	
Lamps and lanterns.....	16,800 00	
Nautical instruments.....	6,425 00	
Flags.....	4,200 00	
Rigging-wire, manila, and blocks.....	23,900 00	
Sails and awnings.....	21,600 00	
Canvas for decks.....	12,850 00	
Plumbing and brassing.....	43,500 00	
Steam-pumps.....	27,800 00	
Steam-gauges.....	3,300 00	
Upholstery, bedding, linen, &c.....	91,592 64	

Carpets.....	\$31,516 60	
Silverware.....	24,707 40	
Stoves and kitchen and cooking utensils.....	17,809 60	
Crockery and glassware.....	11,606 41	
Gas and steam pipe and fittings.....	28,000 00	
Hoisting-engines.....	35,600 00	
Spars for masts.....	12,500 00	
Paints and oils.....	65,000 00	
Joiners' hardware, locks, screws, &c.....	16,700 00	
Covering for boilers, pipes, &c.....	18,000 00	
Engineers' tools and instruments.....	9,000 00	
Drawing-paper, tracing-cloth, &c.....	3,500 00	
Cabin and state-room furniture, chairs, tables, brushes, pails, baskets, cuspidors, &c.....	15,675 00	
Glass for side-lights and windows.....	5,860 00	
Porcelain and glass name-plates.....	2,500 00	
		\$674,350 83
Total amount.....		3,031,565 83

THE RAW-MATERIAL FALLACY.

IV. But before I close I must say a few words about the matter of raw material. Many a man, looking only at his own little interest, demands raw material free, wholly regardless of the equal right to protection of the labor and capital engaged in producing that raw material. The narrow-minded and one-sided policy of the men who cry out for raw material duty free was well illustrated in the last Congress by a few ship-builders who urged the Committee on Ways and Means to report a bill to allow them to import the iron for ships duty free. The average cost of the iron used in the construction of an iron ship (as the forged keel, the stern stem, port rudder, angles and plates) would be $3\frac{1}{2}$ cents per pound in America. This was worth in the coal and ore in the mine not over 5 per cent. of the $3\frac{1}{2}$ cents. The cost of the iron hull to the ship-builder would be 6 cents per pound, or $2\frac{1}{2}$ cents a pound for his labor to complete the ship. Thus the labor, from the miner to the man who made the plates, rivets, and bars, was more by 1 cent a pound than the labor expended by the ship-builder, and the ship was more than half built, in the way of preparation of the material, before the ship-builder touched her. "Yet give me free trade," cries the ship-builder, "on all this material brought up to the point where it suits my use, and let all the other branches of industry, that have capital and labor engaged in building more of the ship than I do, fight out the battle of free trade with men who have cheaper capital and labor." And then, in addition to all this, the ship-builder demands protection for himself on the finished ship. Is this just?

It is not even sensible. For the ship-builder should see that he cannot pay the freight, the commission, and insurance on this material to bring it 3,800 miles, besides paying the advance of 40 per cent. for his labor on the part of the work he performs, and compete with the man who builds the ship in England, having his ship-yard alongside the mines.

Then, if by such a policy he closes up our iron works, as he certainly must, what guarantee has he that the English manufacturer will not put up the price on him? It is certain that such would be the result, for the figures show that the amount of iron produced by this country and required in this market has regulated its price in England as closely as the thermometer mercury follows the changes in the temperature. And it is proof enough of the fact that the raw material that enters into the iron ship is cheaper in this country to-day than it was in England two years ago. We should not lose sight of the important fact

that England and America are the two great iron-producing countries, and that if we stop producing we become dependent upon England, and throw a monopoly into her hands that may and will be turned against ourselves. We are the greatest consumers of iron, and as a nation in that condition, with unlimited resources for its home production, we should be indeed lunatics to become dependent upon any other nation for this or any other essential product. We must protect one and all justly and equitably, reducing the tariff where it is too high, maintaining it where required, favoring no special industry or class, and so fitting protection to the needs of all our industries and manufactures that it shall equally protect all.

Gentlemen of the Commission, there is another point that I wish to call your attention to: that is, the theory that a tariff for revenue only would be ample protection for American capital and labor.

The value of manufactured goods made in this country last year was.....	\$8,000,000,000
The amount imported was	600,000,000
	<hr/>
	8,600,000,000
We exported (about).....	50,000,000
	<hr/>
Total of home consumption.....	8,550,000,000

The best English and American authorities think that with the high rates of interest on capital and our high-priced labor only a few of our industries could be kept in operation. For the sake of argument I will say that these few industries thus kept in existence would manufacture one-sixth of our total consumption, which would be \$1,425,000,000, leaving to be purchased abroad \$1,425,000,000.

Now, the advocate of a "tariff for revenue only" claims that only \$350,000,000 are needed for the expenses of this government, including interest on the national debt. This would give our manufacturers a protection of less than 4 per cent., while the labor on manufactured goods is 70 per cent. of the cost. The interest on his plant is 3½ per cent. more than in Europe. With such a revenue law (one for revenue only), how long would American factories remain in operation unless the rate of labor and interest on capital is reduced to the European standard.

One more fact, gentlemen, I want to call your attention to: that in the years from 1870 to 1880, inclusive, there were imported into the United States, as per official figures, iron, steel, and tin plates, \$430,223,763, or an average of, say, \$43,000,000 a year. This amount of iron and steel was needed for consumption here, and you will remember that from the mine to the form in which it is received here 90 per cent. of its value is labor. We have, then, been giving during that period to the development of foreign countries and the payment of foreign labor the enormous amount of over \$386,000,000.

What is saved from the cost of producing after man is sustained is what builds up towns and cities. How many churches, school-houses, and private dwellings more than we now have should we own if all this \$430,000,000 worth of iron were made at home? Was there anything to prevent those men who are continually crying "monopoly!" from becoming iron-makers?

But there is no end to the many devices resorted to to break up and destroy the effects of the wonderful strides we have made in developing the resources of our country and supplying our own wants.

The schemes of these tariff-for-revenue men are not fully understood. Many of our best citizens are deceived by the plausible way in which they are put.

PHILADELPHIA, PA., *October* 16, 1882.

Mr. ROACH, again addressed the Commission as follows :

I have closely observed the account of the proceedings of the Commission as it has been through different sections of the country where it has held its meetings; but I have nowhere noticed that ship-building, or the ship-owning interest, has been presented to you. Before you conclude the taking of testimony, which you are about to do, I have thought it proper to appear before you and say a few words in regard to these interests. When I was in New York before you in regard to another subject, I was asked to answer the following questions: "First. It is often urged, and indeed several speakers in the House of Commons last spring urged in the debate on the Ritchie resolution for the appointment of a tariff commission to investigate the effect of tariff legislation of other countries upon Great Britain; that the decline of American shipping was almost wholly due to the American theory of protection. Will you kindly explain the several reasons for this decline?" The second question was, "What effect has the passage of sections 2513 and 2514, admitting certain classes of raw materials for the purpose of enabling our ship-builders to build ships to more advantage for engaging in foreign trade, had on the building up of the merchant marine?"

In answer to your first question, gentlemen, I will endeavor to show you, that the decline of American shipping was neither almost wholly nor in any part whatever due to the American theory of protection; that, so far from that being true, the decline was largely due to the absence, in the case of the ship engaged in the foreign carrying trade, of that protection which we gave to our factories and other industries on the land.

To show this I must give you the true reasons for the decline. To find these reasons we must search our history as a ship-building and ship-owning nation.

In doing this, briefly as may be, we must clearly recognize the fact that from the first we have had to compete with a nation whose ambition for two hundred years and more has been to be mistress of the sea; that has jealously watched every step of our marine progress with an interest far keener than that displayed by our own people, and that has sought by war and diplomacy to prevent us from successfully rivaling her on the ocean. This subject cannot be intelligently considered without taking into the account England's shipping interest and policy.

In considering the causes of decline, let us take three periods, namely: 1. The period before our civil war; 2. The period of civil war; and 3. The period since the war.

The first of these was the period of our greatest growth; and also of the beginning of our decline, owing to two causes—the adoption of a policy of subsidy by England; and the revolution from sail to steam, from wood to iron.
